**Supplemental Methods**

*Cell culture*

HEK293T was purchased from Riken cell bank (#RCB2202) and cultured at 37°C with 5% $CO_2$ in D-MEM (FUJIFILM Wako, #043-30085) with 10% fetal bovine serum (FBS; Gibco, #26140079) and Penicillin-Streptomycin Solution (FUJIFILM Wako, #168-23191). Normal human lymphocyte was obtained from peripheral blood mononuclear cells of a healthy volunteer and cultured at 37°C with 5% $CO_2$ in RPMI1640 (FUJIFILM Wako, #189-02025) with 10% FBS. NK92 was purchased from the American Type Culture Collection, and KHYG1 was provided from the Japanese Collection of Research Bioresources. ANKL1 and ANKL3 are primary ANKL cells harvested from two lineages of previously established ANKL-PDXs, ANKL1-PDX and ANKL3-PDX, as described in our previous study. ANKL1 was cultured at 37°C in a $CO_2$-free incubator in Leibovitz's L-15 Medium (Gibco, #11415064) with 5% FBS, non-essential amino acids (FUJIFILM Wako, #139-15651), 100 units/mL human recombinant interleukin (IL)-2 (Peprotech, #200-02), and 0.1 mM 2-mercaptoethanol (FUJIFILM Wako, #131-14572). The other cells were cultured at 37°C with 5% $CO_2$ in Artemis Medium-1 (Nihon Techno Service; no available catalog number) with 2% heat-inactivated human serum (KOHJIN BIO, #12181201).

*Antibodies and reagents*

The following antibodies, purchased from BioLegend, were used for flow cytometry analysis:

biotin-conjugated anti-human CD45 (#34004), FITC-conjugated anti-human CD45 (#368508), APC-conjugated anti-human CD45 (#304012), DyLight 649 goat anti-mouse IgG (#405312), and Alexa Fluor 488 goat anti-mouse IgG (#405319). All antibodies were used at ×500 dilution. DNA was stained using propidium iodide (PI; Sigma-Aldrich, #P4170) for cell cycle analysis and dead cell detection. The antibody used for CD56 immunohistochemistry was purchased from Leica Biosystems (#CD56-504-L-CE). Antibodies used for western blotting were purchased and diluted as follows: mouse anti-beta actin (Sigma-Aldrich, #A5441; ×1,000 dilution), rabbit anti-CD71 (Proteintech, #10084-2-AP; ×1,000 dilution), rabbit anti-Myc (Cell Signaling Technology, #9402; ×500 dilution), rabbit anti-phospho-p70 S6 kinase (Cell Signaling Technology, #9205S; ×500 dilution), mouse anti-L-type amino acid transporter 1 (LAT1; Santa Cruz Biotechnology, #sc-37432; ×500 dilution), HRP-conjugated goat anti-mouse IgG (Proteintech, #SA0001-1; ×2,000 dilution), and HRP-conjugated goat anti-rabbit IgG (Proteintech, #SA00001-2; ×2,000 dilution). PPMX-T003, an anti-human transferrin receptor 1 inhibitory antibody, was kindly provided by Perseus Proteomics, Inc. JPH-203, a specific inhibitor of LAT1 was purchased from TargetMol (#TQ0081) and was diluted in dimethyl sulfoxide. Rapamycin, a mammalian target of rapamycin inhibitor, was purchased from AdipoGen (#AG-CN2-0025-C100) and was diluted in dimethyl sulfoxide.

*Animal breeding and reproduction of ANKL-PDXs*

Six-week-old female NOD/Shi-scid, IL-2RγKO (NOG) mice were purchased from In-Vivo Science and bred in a specific pathogen-free area of the animal facility of Tokai University, where the temperature, humidity, and illuminance are adequately controlled. Seven to eleven-week-old mice were used in all the experiments. All mice received humane care, and the humane endpoint was decided for mice whose body weight continuously decreased by more than 15% of their maximum body weight or showed remarkable debilitation. The ANKL-PDXs used in this study were established as described in our previously published article in detail(1). ANKL-PDXs were reproduced (passaged) by intravenous injection of ANKL cells harvested from ANKL-PDXs into another NOG mouse.

*Harvesting primary ANKL cells from ANKL-PDXs*

The liver and spleen were extracted from ANKL-PDXs seven to 11 days after inoculation with ANKL cells. Both organs were homogenized and filtered with a 70-μm cell strainer (Falcon, #352350), followed by enzymatic digestion in HBSS (+) (FUJIFILM Wako, #084-08965) containing 1 mg/mL collagenase A (Roche, #11088793001) and 100 U DNase I (Roche, #10104159001) for 15 min at 37°C. Hepatocytes were removed using density gradient centrifugation using 35% Percoll (Sigma-Aldrich, #P1644) diluted in HBSS (-) (FUJIFILM Wako, #085-09355). Finally, the ANKL cells were sorted using automated Magnetic-Activated Cell Sorting (autoMACS; Myltenyi Biotech) using a biotin-conjugated anti-human CD45 antibody

and anti-biotin microbeads (Miltenyi Biotech, #130-090-485). Harvested ANKL cells were stored in a deep freezer with a CELLBANKER (ZENOGEN PHARMA #11910). The original method for harvesting ANKL cells from PDX was described in our previous study(1).

*Flow cytometric analysis and cell sorting*

Cells were washed several times with 2% FBS-containing phosphate-buffered saline, followed by incubation in an adequate concentration of the antibody solution for 30–60 min. The stained cells were washed several times with 2% FBS-containing phosphate-buffered saline. For intracellular staining, cells were fixed and permeabilized with chilled 70% ethanol after staining the surface molecules and then blocked with 2% bovine serum albumin for 15 min, followed by intracellular antigen staining. Surface or intracellular molecular expression was analyzed using FACS Lyric or LSR Fortessa (Becton, Dickinson). Cell sorting was performed using a FACS Melody or Aria III (Becton, Dickinson). Data processing and analysis were performed using FlowJo version 10 (Becton, Dickinson).

*Western blotting*

Cells were directly lysed in 1x Laemmli sample buffer (60 mM Tris-HCl pH 6.8, 2% sodium dodecyl sulfate, 10% glycerol, 5% 2-mercaptoethanol, and 0.02% bromophenol blue), followed by boiling at 96°C in a heat block for 10 min. Samples were applied in 10–15% acrylamide gel

electrophoresis. Proteins in acrylamide were then transferred to 0.2-μm poly-vinylidene di-fluoride membrane (FUJIFILM, #033-22453) using HorizeBLOT 4M-R (ATTO, #2322470). Membranes were blocked with 5% skim milk for 2 h. Primary antibodies were diluted with 5% skim milk and applied to the membranes at room temperature for 2 h. After washing the membrane with Tris-buffered saline containing 0.05% Tween 20, the secondary antibody was diluted with 5% skim milk and incubated at room temperature for 45 min. After washing the membrane, an adequate volume of Immobilon Western Chemiluminescent HRP substrate (Merck Millipore, #WBKLS0100) was applied, and luminescence was detected using FUSION SOLO.7S.EDGE (Vilber Bio Imaging).

*Quantitative PCR*

Total cellular RNA was extracted using Sepasol-RNA I Super G (Nacalai Tesque, #09379-55) followed by reverse transcription using ReverTra Ace qPCR Master Mix with gDNA Remover (TOYOBO, #FSQ-301). PCR was performed using THUNDERBIRD SYBR qPCR Mix (TOYOBO, #QPS-201) and StepOnePlus Real-Time PCR System (Applied Biosystems). *ACTB* expression value was selected as an internal control, and the $2^{-\Delta\Delta CT}$ method was used for data analysis. Primer sequences used for PCR were as follows; *ACTB*-Forward: 5′-CTCTTCCAGCCTTCCTTCCT-3′, *ACTB*-Reverse: 5′-AGCACTGTGTTGGCGTACAG-3′, *MYC*-Forward: 5′-CACCAGCAGCGACTCTGA-3′, *MYC*-

Reverse: 5′-GATCCAGACTCTGACCTTTTGC-3′, *TFRC*-Forward: 5′-ACTTCTTCCGTGCTACTTCCAG-3′, *TFRC*-Reverse: 5′-ACTCCACTCTCATGACACGATC-3′, *TXNIP*-Forward: 5′-CAGCAGTGCAAACAGACTTCGG-3′.

*Transduction using lentiviral vector*

Second-generation lentiviral packaging vectors psPAX2 (Addgene, #12260) and pMD2.G (Addgene, #12259) were cotransfected into HEK293T cells with plasmids containing the proposed gene (encoding sgRNA, Cas9, or luciferase) using PEI MAX (Polysciences, #24765-1). The culture supernatant was collected 48 h after transfection and centrifuged at 10,000 × *g* for 4 h to concentrate the lentiviruses. Target cells were then treated with concentrated lentiviral supernatant on culture plates coated with RetroNectin (Takara Bio, #T100A) and centrifuged at 1,000 × *g* for 90 min for infection.

*sgRNA designation and related plasmid construction*

sgRNAs targeting specific genes were designed by an online-available tool, CHOPCHOP (http://chopchop.cbu.uib.no/). The non-target sgRNA sequence was obtained from BRDN0001149198 (#80248; Addgene). Oligonucleotides were obtained from Eurofin Genomics and ligated into the FG12 (Addgene, #14884)-based sgRNA and mRFP expression plasmid, which was kindly provided by Prof. Hirao, after enzymatic digestion using *BsmBI* (New England

BioLabs, #R0580S) according to the manufacturer's protocol. Sequences of sgRNAs were as follows: non-target sgRNA (sgNT): 5′-GTATTACTGATATTGGTGGG-3′, sg*SLC7A5*: 5′-TGGCGGGTAGCGGCTCACCA-3′, sg*SLC1A5*: 5′-CAGCGCCACACCAAAGACGA-3′.

*CRISPR-Cas9 gene knockout procedure*

Cells were sequentially transduced with lentiCas9-Venus (Addgene, #70267) and the sgRNA plasmid as described above, followed by purification using flow cytometry for 48 h or more after transduction.

*In vivo imaging assay*

The Lampyridae luciferase gene was cloned into CSII-CMV-MCS (Riken, #RDB04377) and digested with *AgeI* (New England Biolabs, #R3552S) and *BamHI* (New England Biolabs, #R3136S). ANKL1 and ANKL3 cells were then transduced with the constructed vectors (ANKL1$^{Luc}$ and ANKL3$^{Luc}$, respectively), and ANKL-PDXs were established using them. On the day of the analysis, 150 mg/kg luciferin (Promega, #P1043) was intraperitoneally injected, and luminescence was detected using an IVIS Lumina II (Caliper Life Science) under 2.5% isoflurane inhalation. Luminescence was measured using the Living Image software (version 4.3.1; PerkinElmer).

*Histological analysis*

The livers and spleens were obtained from sacrificed ANKL-PDX mice, fixed in 4% formaldehyde, and embedded in paraffin. The sections were stained with hematoxylin and eosin. Immunohistochemistry was performed using Bond Polymer Refine Detection (Leica, #DS9800), as previously reported(2). Images of the tissue slides were scanned and converted into a virtual slide image format using CellSense software (Olympus) and observed using NDP.view2 (Hamamatsu Photonics).

*Transcriptomic analysis with publicly-available RNA-seq data*

Transcriptomic data of primary ANKL and normal NK cells used in our previous study were obtained from the Gene Expression Omnibus (GSE189722)[1]. FASTQ files were mapped to GRCh38.95, available in Ensembl (https://www.ensembl.org; accessed on 10th Sep. 2021), using HISAT2 version 2.2.0. The mapped reads were counted using StringTie version 2.1.3b. Differentially expressed genes were detected using DESeq2 version 1.38.3, and gene set enrichment analysis was performed using clusterProfiler version 4.6.2, with a GMT-formatted file of HALLMARK of human MSigDB v2023.1, as described in the Methods section of the manuscript.

*DNA damage detection assay*

The cells were cultured for adequate periods with or without reagents, harvested, fixed, and

permeabilized with chilled 70% ethanol. DNA damage was detected via the detection of γH2AX using DNA Damage Detection Kit (Dojindo, #343-09421), following the manufacturer's protocol. DyLight 649 goat anti-mouse IgG antibody was used as the secondary antibody in several analyses instead of the secondary antibody in the kit. Fluorescence was detected using flow cytometry.

*Single-amino acid deprivation assay*

Amino acid-deprived RPMI-1640 medium was purchased from the Research Institute for the Functional Peptides. Purified amino acids were purchased from FUJIFILM Wako, as follows; L(+)-Arginine (#019-04611), L-Asparagine Monohydrate (#019-04812), L-Aspartic Acid (#013-04832), L-Glutamic Acid (#070-00502), Glycine (#073-00732), L-Histidine (#086-00681), L-Isoleucine (#123-00861), L-Leucine (#126-00851), L-Methionine (#135-01601), L(-)-Phenylalanine (163-01301), L(-)-Proline (#163-04601), L-Serine (#191-00401), L-Threonine (#206-01321), L-Tryptophan (#206-03381), L-Valine (#220-00081), L-Cysteine (#039-20652), and L-Tyrosine (#204-03561). L-Glutamine was purchased from Gibco (#2530081). Adequate volumes of each amino acid were independently added to the amino acid-deprived RPMI-1640 medium at the same concentration as the original RPMI-1640, and a single-amino acid-deprived RPMI-1640 medium was prepared. NK92, KHYG1, ANKL1, and ANKL3 cells were cultured at 37°C with 5% $CO_2$ in single-amino acid-deprived RPMI1640 with 10% FBS and 100 units/mL

recombinant human IL-2 for 24 h (ANKL1) or 48 h (other cells). Cultured cells were harvested and counted using the MTT Cell Count Kit (Nacalai Tesque, #23506-80; for NK92 and KHYG1) or trypan blue staining (FUJIFILM Wako, #207-17081; for ANKL1 and ANKL3), following the manufacturer's protocols.

*In vitro growth competition assay of single gene-knocked-out cells*

Cas9-Venus overexpressed cells were transduced with the sgRNA-RFP expression plasmid and cultured without further purification. The proportion of $RFP^+$ cells in $Venus^+$ cells was measured using flow cytometry five and eight days after transduction, and the relative existence ratio of knocked-out cells in eight days compared with five days after transduction was calculated. The lentivirus titer was adjusted as the $RFP^+$ cell ratio reached 40–60% five days after transduction.

*In vivo growth competition assay of single gene-knocked out ANKL cells in the liver*

Cas9-Venus overexpressed ANKL1 and ANKL3 cells were transduced with sgRNA-RFP expression plasmid and purified $RFP^+$ cells 48 h after transduction using flow cytometry with more than 90% efficiency. The sorted cells were intravenously inoculated into NOG mice and harvested from the liver seven days after injection. The collected cells were analyzed using flow cytometry to calculate the RFP+ proportion in Venus+ cells.

*Cell growth and viability assay*

First, $3 \times 10^4$ cells (cell lines) or $1 \times 10^5$ cells (primary cells) were cultured at 37°C with 5% $CO_2$ in 800 μL adequate culture medium with antibodies or reagents for 48 h (cell lines) or 24 h (primary cells). Then, cells were transferred into a 96-well plate, and an MTT assay or trypan blue staining was performed to assess cell growth or viability following the manufacturer's protocol, as described above.

*Live cell staining of intracellular ferrous ions and mitochondrial reactive oxygen species*

Intracellular ferrous ions and mitochondrial reactive oxygen species were stained with FerroOrange and mtSOX deep red (Dojindo, #F374 and #MT14, respectively) following the manufacturer's protocol. FerroOrange and mtSOX deep red fluorescence was detected using light microscopy (IX83; Olympus) and flow cytometry, respectively.

*Cell cycle assay*

Harvested cells were fixed and permeabilized, and then RNAs were digested using 20 μg/mL RNase (NIPPON GENE, #313-01461). Cellular DNA was stained with 50 μg/mL PI, and fluorescence was measured using flow cytometry to determine the cell cycle. To detect DNA-synthesizing cells of liver-resident ANKL cells *in vivo* for better separation of the G0/1 and S-phase cell cycles, 50 mg/kg EdU was intraperitoneally inoculated into ANKL-PDX two hours before sacrifice. EdU was labeled using the Click-iT Plus EdU Flow Cytometry Assay Kit

(Thermo Fisher Scientific, #C10634) and detected using flow cytometry.
