

Neuropsychological Testing in Autoimmune Encephalitis: A Scoping Review

Neurol Neuroimmunol Neuroinflamm 2024;11:e200204. doi:10.1212/NXI.000000000200204

In the Research Article “Neuropsychological Testing in Autoimmune Encephalitis: A Scoping Review” by Galioto et al.,¹ the first sentence of the second paragraph under Study Selection, Inclusion/Exclusion Criteria, and Participants should read, “Exclusion criteria were (1) composite scores (comprised the results from multiple tests) only, (2) cognitive screening measures only, and (3) total sample size <5 patients (though specific neural-IgG AE cohorts could have had fewer than 5 patients).” The publisher regrets the error.
