Straub J J, Paul K K, Bothwell L G, et al. (June 11, 2024) Correction: Risk of Suicide and Self-Harm Following Gender-Affirmation Surgery. *Cureus* 16(6): c182. doi:10.7759/cureus.c182

Correction Notice

This article has been corrected by the Editors-in-Chief to clarify the conclusions of the study. Two sentences have been revised as detailed below. The authors agree with these corrections.

- Original abstract conclusions: "Gender-affirming surgery is significantly associated with elevated suicide attempt risks, underlining the necessity for comprehensive post-procedure psychiatric support."

Corrected to: "Patients who have undergone gender-affirming surgery are associated with a significantly elevated risk of suicide, highlighting the necessity for comprehensive post-procedure psychiatric support."

- Original first sentence of the Conclusions section: "The results of this study show that gender-affirmation surgery is associated with a significantly higher risk of suicide, death, suicide/self-harm, and PTSD compared to control groups in this real-world database."

Corrected to: "The results of this study indicate that patients who have undergone gender affirmation surgery are associated with significantly higher risks of suicide, self-harm, and PTSD compared to general population control groups in this real-world database."
