

## CLINICAL @LERT

# To perform or not to perform liver biopsy—that is the question

R W Chapman

Should liver biopsy be performed to determine the cause of abnormal liver biochemical tests in the absence of diagnostic serology?

### COMMENT

One of the most difficult management decisions in clinical hepatology, especially for the general gastroenterologist, is whether to perform a liver biopsy in a patient with abnormal liver function tests, particularly in the absence of diagnostic serology, or a history of drug or alcohol use. At first sight the benefits of performing an invasive procedure in such asymptomatic patients are not obvious when balanced against the potential hazards of bile leak or haemorrhage.<sup>1</sup>

Histological causes of abnormal liver biochemistry have been studied previously in patients with excess alcohol ingestion or advanced liver disease.<sup>2,3</sup> However, to date, there have been few published histological data on asymptomatic patients with persistently abnormal liver enzyme abnormalities on which to base management decisions such as liver biopsy. In a recent Scandinavian study, 150 asymptomatic patients with elevated serum transaminases underwent liver biopsy.<sup>4</sup> While fibrosis was observed in half of the biopsies, only 2% were cirrhotic, and in the majority a mild pericellular fibrosis was seen, the clinical significance of which was unclear. Despite the lack of evidence, a recent review concluded that liver histology should be obtained in such asymptomatic patients.<sup>5</sup> Is this conclusion correct? The study from Skelly and colleagues<sup>6</sup> would suggest that it is. In this important prospective study, 354 patients with persistently abnormal liver enzymes (more than twice the upper limit of normal for greater than six months) underwent liver biopsy. Although not definitely stated, it is implied that patients were asymptomatic. Perhaps not surprisingly, in view of similar results obtained by Daniel and colleagues,<sup>7</sup> by far the most prevalent histological findings in the study were non-alcoholic steatohepatitis (NASH) and the associated lesion non-alcoholic fatty liver disease (NAFLD),

**Skelly MM, James PD, Ryder SD. Findings on liver biopsy to investigate abnormal liver function tests in the absence of diagnostic serology. *J Hepatol* 2001;**35**:195–9.**

**Background:** The use of liver biopsy to determine the cause of abnormal liver biochemical tests in the absence of diagnostic serology is unclear.

**Objective:** To describe histological findings on liver biopsy of a large number of patients with abnormal liver biochemical tests in whom the aetiology was unclear from serological tests.

**Design:** A prospective case series.

**Patients:** Consecutive patients at the University Hospital, Queen's Medical Centre, Nottingham, UK, who underwent liver biopsy for investigation of unexplained abnormal liver function tests (n=354). Patients were excluded if they had positive serological testing for autoantibodies, viral markers, copper and iron storage,  $\alpha_1$  antitrypsin deficiency, or a known diagnosis of liver disease or a history of alcohol intake above the recommended limits.

**Results:** There were 21 normal liver biopsies (6%). Final diagnoses included non-alcoholic steatohepatitis in 120 (34%) cases and fatty liver in 115 (32%). Cryptogenic hepatitis was described in 32 (9%) patients and drug related damage in 27 (7.6%). Other diagnoses included alcohol related disease in 10 (2.8%) patients, autoimmune hepatitis in seven (1.9%), and a variety of other autoimmune and storage diseases in small numbers. Some degree of fibrosis was found on biopsy in 93 patients (26%), including cirrhosis in 21 cases (6%), but biochemical abnormality did not predict liver biopsy findings.

**Conclusions:** Liver biopsy was helpful in the diagnosis and management in patients with abnormal liver biochemistry with negative serological markers. The most common abnormalities were non-alcoholic steatohepatitis and fatty liver. Biochemical abnormality was a poor predictor of stage of liver disease.

which was found in two thirds of the patients studied. Does this matter? Recent evidence would suggest that approximately one third of NAFLD patients will progress to fibrosis and 20% will develop cirrhosis.<sup>8,9</sup> Accurate diagnosis of fibrotic liver disease, found in 20% of the patients in this study, may expedite earlier therapeutic intervention which may prevent progression to end stage liver disease.

The most important finding of the study was that in 18% of patients their management was directly altered by the histological findings. Six per cent were found to have cirrhosis, and a wide variety of chronic liver diseases (some familial) were diagnosed. Previously unsuspected alcohol was discovered in 10 patients, as Kingham has pointed out, "I suspect one man's NASH is another man's ASH".<sup>10</sup> Interestingly, very similar results were obtained in a smaller

prospective study from the Mayo Clinic<sup>11</sup> but the authors reached an exactly opposite conclusion viz that "routine biopsies with chronically abnormal liver tests are of limited clinical value". They reached this conclusion on the grounds that little specific therapy is available for NAFLD. I believe however that the study by Skelly *et al* has made a strong case for liver biopsy in the majority of asymptomatic patients with persistently abnormal liver tests.

The unresolved question from this study is whether a liver biopsy is indicated in patients with an isolated rise in serum gamma-glutamyl transpeptidase. In the present study, 11% of such patients had fibrosis although the degree is not described. However, in a report from our unit, none of our patients, all of whom were alcoholic, had any fibrosis or signs of progressive liver

disease.<sup>12</sup> Further larger studies are required to answer this important issue.

#### New GUT online submission and review system

The Editors of *GUT* are pleased to inform authors and reviewers of its new online submission and review system. *Bench>Press* is a fully integrated electronic system which uses the internet to allow rapid and efficient submission of manuscripts, plus the entire peer review process to be conducted online.

Authors can submit their manuscript in any standard word processing software. Graphic formats acceptable are: .jpg, .tiff, .gif, and eps. Text and graphic files are automatically converted to PDF for ease of distribution and reviewing purposes. Authors are asked to approve their submission before it formally enters the reviewing process.

To access the system click on "SUBMIT YOUR MANUSCRIPT HERE" on the *GUT* homepage: <http://www.gutjnl.com/>, or you can access *Bench>Press* directly at <http://submit-gut.bmjournals.com/>.

We are very excited with this new development and we would encourage authors and reviewers to use the on-line system where possible. It really is simple to use and should be a big improvement on the current peer review process. Full instructions can be found on *Bench>Press* <http://submit-gut.bmjournals.com/>, and *GUT online* at <http://www.gutjnl.com/>. Please contact Natalie Davies, Project Manager, [ndavies@bmjgroup.com](mailto:ndavies@bmjgroup.com) for further information.

#### PRE-REGISTER WITH THE SYSTEM

We would be grateful if all *GUT* authors and reviewers pre-registered with the system. This will give you the opportunity to update your contact and expertise data, allowing us to provide you with a more efficient service.

##### Instructions for registering

1. Enter <http://submit-gut.bmjournals.com>
2. Click on "Create a New Account" in the upper left hand side of the *Bench>Press* homepage
3. Enter your email address in the space provided.
4. Please be sure to enter the email address that you received this email message at. You will be given the opportunity to change this once you have created an account.
5. Choose a password for yourself and enter it in the spaces provided.
6. Complete the question of your choice to be used in the event you cannot remember your password at a later time.
7. Click on the "Save" button at the bottom of the screen.
8. Check the e-mail account you registered under. An email will be sent to you with a verification number and URL.
9. Once you receive this verification number, click on the URL hyperlink and enter the verification number in the relevant field. This is for security reasons and to check that your account is not being used fraudulently.
10. Enter/amend your contact information, and update your expertise data.
