

THE INCIDENCE OF MALIGNANT NEOPLASMS IN JAMAICA

G. BRAS, D. C. WATLER AND A. ASHMEADE-DYER

From the Jamaica Cancer Registry, Department of Pathology, University of the West Indies, Jamaica

Received for publication June 24, 1965

To determine cancer incidences accurately it is necessary to have adequate diagnostic facilities available to the population at risk, as well as demographic data on that population. The Jamaica Cancer Registry therefore restricts its activity to that region of Jamaica where these desiderata are fulfilled. Figures accumulated over a six-year period—1958–1963 inclusive—are now presented.

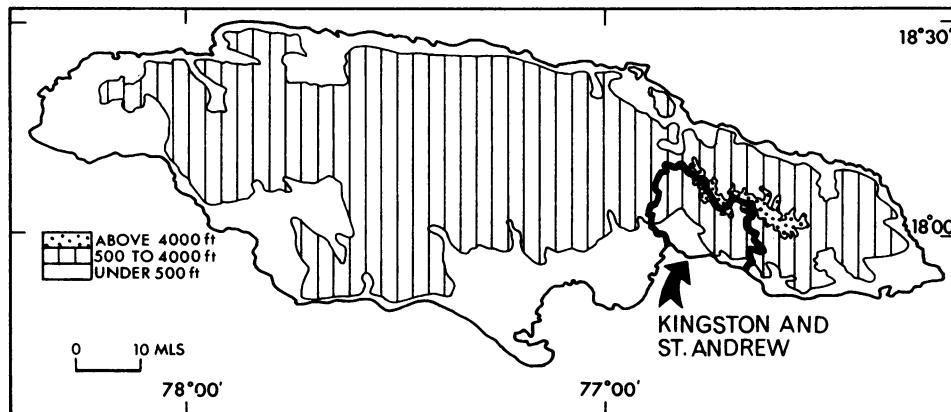

FIG. 1.—The island of Jamaica ; elevations above sea level are shown.

Geographical data.—Fig. 1 shows an outline of Jamaica giving elevations above sea level, Fig. 2 gives details on the parishes served by the Cancer Registry ; these data include rock types, rainfall, background gamma radiation in micro roentgen per hour. Some climatological data are grouped in Table I.

Kingston is in the rain shadow of the Blue Mountains (peak 7430 ft high), where moist North East trade winds lose most of their water. Consequently

TABLE I.—*Climatological Data for Kingston**

| Temperature in degrees F. | | | Humidity | | | Sunshine | | |
|-----------------------------------|----|-----------------------------------|----------|--------------|---------------|----------|--|--|
| Mean | 79 | . Mean | 80% | . Jan.–March | 70–72% (Max.) | | | |
| Hottest monthly average | 81 | . Highest month (Oct.) | 84% | . Sept.–Nov. | 50–57% (Min.) | | | |
| Coolest | 76 | . Lowest (July) | 78% | | | | | |
| Annual range | 5 | | | | | | | |
| Highest ever | 97 | | | | | | | |
| Coolest ever | 50 | | | | | | | |

* Average of readings over 33 years, 4 times daily, at elevation of 100 ft.

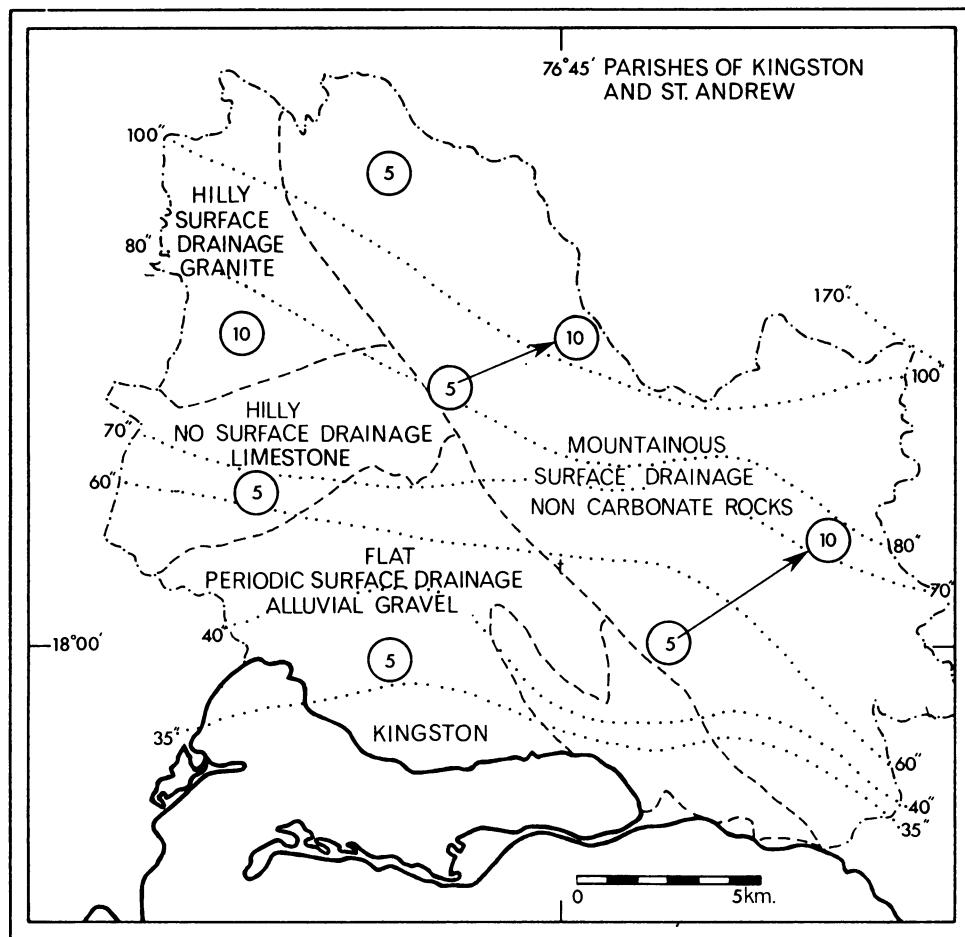

FIG. 2. -Some data on the parishes of Kingston and St. Andrew including rock types, rainfall in inches per annum, and (circled) background gamma radiation in micro roentgen per hour.

whereas the rainfall in the Blue Mountains is 200 in. per annum it is less than 40 in. per annum in the city of Kingston.

Two rainy periods occur respectively in May and October and most rain falls in torrential downpours. Droughts causing serious water shortages occurred frequently before modern hydrological methods came into use approximately 30 years ago.

Demographical data.—Data provided by Roberts (1957) show that the population of Jamaica has since 1844 retained a greater degree of homogeneity than most of the other populations of the West Indies; there was only a small amount of migration after cessation of the slave trade. Ever since 1881, when full racial breakdowns first became available, 96% in the population returns were made up by those groups designated as black (Negroes) and as coloured (mainly the product of Negro and European inter mixture); these groups have consistently made up

respectively 78% and 18% of the total population, which between 1844 and 1960 rose from 377,433 to 1·6 million.

TABLE II.—*Population of Kingston and St. Andrew Census, 1960*

| Age group | Male | Female |
|-----------|--------|--------|
| 0-4 | 32,373 | 32,078 |
| 5-9 | 23,197 | 23,933 |
| 10-14 | 17,032 | 19,012 |
| 15-19 | 17,108 | 22,816 |
| 20-24 | 17,865 | 23,712 |
| 25-29 | 16,151 | 21,654 |
| 30-34 | 13,145 | 17,155 |
| 35-39 | 11,805 | 15,743 |
| 40-44 | 10,343 | 12,222 |
| 45-49 | 9,342 | 11,085 |
| 50-54 | 7,387 | 9,084 |
| 55-59 | 5,091 | 6,565 |
| 60-64 | 3,686 | 5,012 |
| 65-69 | 2,051 | 3,277 |
| 70-74 | 1,451 | 2,538 |
| 75-79 | 904 | 1,775 |
| 80+ | 837 | 1,987 |

Total = 189,768 Total = 229,648

Of special interest for our Cancer Registry is an analysis of racial elements in the Kingston and St. Andrew area. Roberts' figures show that Whites are the most urban with 60% of their numbers in Kingston and St. Andrew, followed by Chinese (50%), Coloured (30%), East Indian (20%), Negroes (16%). This means that in the Kingston and St. Andrew population—having approximately $\frac{1}{5}$ of the total island's population—Negroes make up 65% and Coloured 30% of the

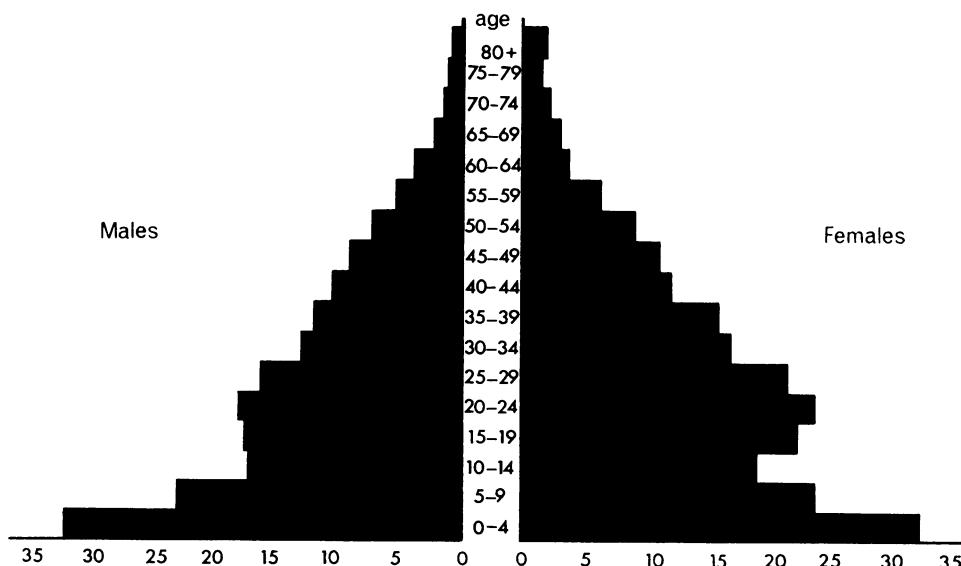

FIG. 3.—The Jamaican population (in thousands) during the 1960 census.

population in this area. The remaining 5% is made up approximately as follows : Chinese 1·2%, East Indians 0·4%, Europeans 0·3%, others 3·1%.

Occupational data.—"Unfortunately, in analysing occupational data, we enter a domain in which census material proves often treacherous and unrewarding" (Roberts, 1957, p. 85). Figures available show the following sub-division of the working force : professional 5%, domestic (personal) 14%, commercial 11%, agricultural 44%, industrial 26%. Industrialization, however, is progressing rapidly and the agricultural labour force decreasing concurrently.

Literacy proportions (percentage of population over 5 able to read and write) is above 90% of the Kingston and St. Andrew area, but even in the most backward parishes the figure is not below 60%.

Organization of the Registry and Results

The Registry is centred at the University—just outside Kingston. It records all cases diagnosed in the Kingston and St. Andrew hospitals. This area is served by several well equipped hospitals and the Registry staff collects data on cancer from all hospitals, nursing homes and medical practitioners (Table III).

Returns from the Registrar General are compared with and provide a cross-check with the figures so obtained.

Histological confirmation for the cancer diagnosis was obtained in 79% of the male cases and 85% of the female cases (Table IV). Where no histology was available the diagnosis was only accepted on combined clinical and radiological evidence.

The patient's permanent address was carefully checked and, for purposes of the incidence study reported here, only residents of Kingston and St. Andrew were included.

During 1958–1963 a total of 2898 malignant neoplasms were registered (Table V); Table VI gives data for each year of operation.

Comparison with other countries

Tables VII and VIII compare some of our findings with data from Denmark (Clemmesen and Nielsen, 1952) and from African Bantus (Higginson and Oettlé, 1960).

The following seem worthy of further comment : *Oesophageal carcinoma* has a high incidence, as in the Bantu. Primary *carcinoma of the liver* is much rarer than in the Bantu, but more common than in Denmark. *Carcinoma of stomach* is the single most frequent tumour in the Jamaican male ; gastro-intestinal cancers are more frequent than in the Bantu but below the Danish figures. *Cancer of the skin* is remarkably common in Jamaica when compared with the Bantus. *Reproductive organs.* Penis carcinoma is common in Jamaica as it is in the Bantu and so is carcinoma of the cervix uteri ; (circumcision is not common in Jamaican males). Testis cancers are rare in Jamaicans and Bantus. Breast cancer is common in Jamaica and Denmark, rarer in the Bantu.

SUMMARY

The Cancer Registry in Jamaica has accumulated complete data on a population of 420,000 in whom, during 1958–1963 inclusive, a total of 2898 malignant neoplasms were observed. Table V shows the distribution of these tumours by

TABLE VII.—*Comparison of Cancer Incidence in All Sites by Age Groups*

| Age groups | Males | | | Females | | |
|--------------|----------------------------|------------------------|---------------------------|----------------------------|------------------------|---------------------------|
| | K. & St. A. (1958-1963) | Denmark (1943-1947) | S.A. Bantu (1953-1955) | K. & St. A. (1958-1963) | Denmark (1943-1947) | S.A. Bantu (1953-1955) |
| No. observed | No. expected | No. expected | No. observed | No. expected | No. expected | |
| 0-14 | 44 | 103.6 | 44.0 | 31 | 95 | 31.8 |
| 15-24 | 30 | | 35.6 | 40 | | 44.3 |
| 25-34 | 50 | 65.4 | 59.9 | 138 | 137.3 | 106.6 |
| 35-44 | 90 | 104.3 | 93.2 | 279 | 302.1 | 224.7 |
| 45-54 | 238 | 217.7 | 181.5 | 480 | 433.5 | 296.3 |
| 55-64 | 299 | 283.8 | 172.8 | 364 | 427.7 | 393.3 |
| 65-74 | 230 | 233.9 | 122.4 | 270 | 360.5 | 225.6 |
| 75+ | 104 | 188.7 | 63.8 | 165 | 367.7 | 112.1 |
| Unknown | 15 | — | — | 31 | — | — |
| Total | 1100 | 1197.4 | 773.2 | 1798 | 2123.8 | 1434.7 |

TABLE VIII.—*Comparison of Cancer Incidence in Kingston and St. Andrew (1958-1963) with Denmark (1943-1947)*

| Site | Males | | Females | |
|----------------------------|-----------------------------|-----------------------------------|-----------------------------|-----------------------------------|
| | No. of cases K. & St. A. | Cases expected at Danish rates | No. of cases K. & St. A. | Cases expected at Danish rates |
| Buccal cavity & pharynx | 66 | 21.2 | 49 | 21.8 |
| Oesophagus | 87 | 29.9 | 39 | 24.2 |
| Stomach | 160 | 236 | 91 | 268.7 |
| Large intestine and rectum | 76 | 200 | 131 | 246.9 |
| Liver (1°) | 26 | 3.6 | 11 | 3.3 |
| Lung | 83 | 80.3 | 24 | 24.3 |
| Breast | 5 | — | 315 | 419.0 |
| Cervix | — | — | 522 | 297.2 |
| Body of uterus | — | — | 40 | 78.3 |
| Testes | 5 | 32.9 | — | — |
| Penis | 62 | 7.1 | — | — |
| Skin | 103 | 93.5 | 109 | 96.9 |
| Leukaemias | 38 | 56.4 | 34 | 53.4 |
| Other sites | 389 | 436.8 | 433 | 589.8 |
| Total | 1100 | 1197.7 | 1798 | 2123.8 |

primary site and by sex. Table VII compares the total cancer incidence with those in Denmark and in the South African Bantu ; Table VIII compares Jamaica and Denmark regarding certain cancer types.

This Registry is supported by the British Empire Cancer Campaign for Research.
