## Paired Receptor Systems of the Innate Immune System

Eriko Yamada and Daniel W. McVicar

Cancer and Inflammation Program, Laboratory of Experimental Immunology, Center for Cancer Research, National Cancer Institute-Frederick, Frederick, MD 21702, USA

### Introduction

Upon infection, the host immune system must integrate a constellation of extracellular signals to orchestrate the migration and activation of the multiple cell types required for the development an appropriate response. The host's response must be strong enough to eliminate the pathogen, but at the same time regulated so as not to inflict unwarranted damage to bystander tissues. Cells of the innate immune system are the first to be activated following infection, and therefore, typically play both a vital early effector role and a key regulatory role in both the development and attenuation of the inflammatory response. In addition, innate immune cells are critical in shaping the subsequent adaptive immune response.

As an adaptation to this critical role, innate immune cells express many regulatory receptors. Unlike T cells and B cells, the response of innate immune cells is not generally regulated through antigen specific receptors. Instead, they detect infection through more generalized methods such as the recognition of pathogen-associated molecular patterns or screening for indicators of stress such as modification or absence of MHC class I molecules. Since innate immune responses are not antigen specific, the system requires tight regulatory controls that interpret signals from several receptor-ligand interactions. One mechanism for this regulation is the expression of Paired Receptor Systems.

Paired receptors tune the inflammatory response. Many of the inhibitory receptors within paired systems participate in self tolerance by recognizing ubiquitously expressed endogenous molecules such as MHC class I molecules, cell surface sialic acid modified proteins, or CD200. During infection these markers of self are either downregulated or modified. At the same time, stress related molecules are expressed. The activating siblings of Paired Receptor Systems may recognize these "alert" molecules up-regulated as a consequence of infection or may bind constitutively expressed ligands that gain advantage as inhibitory ligands are downregulated. Alternatively, activating siblings may directly recognize pathogen associated or encoded ligands. Perhaps resolution of this issue will follow the positive identification of more activating ligands. Regardless, it is clear that these paired systems play critical roles in overall regulation of innate immunity.

In this table we review paired receptors involved in the innate immune system. For purposes of this review we define "Paired Receptors" as families of related membrane proteins that show the following characteristics: 1) encoded by different genes, but located as a gene cluster on a given chromosomes, 2) have significant homology within their extracellular domains, 3) expressed on overlapping immune populations and, 4) confirmed to have both activating and inhibitory members. For simplicity in nomenclature, whenever possible we have used the official gene nomenclature provided by NCBI and listed all other names in the alias field. In addition, we have provided a listing of both mouse and human paired systems as some families exist in both species whereas others are important in the study of either human or murine models of disease.

Table 1

Mouse	Family	Receptor	Cellular Expression	Chromosome location	Other names	Receptor characteristics	Cytoplasmic tyrosine motifs	Ligand(s)	Action	References
CD200r	Cd200r1		Granulocytes, Monocytes, DCs, Macrophages, Mst cells, T cells, NKT cells, B cells	16	CD200R, Mox2r, OXR	Type I transmembrane protein, 2 Ig-like domains	None	CD200	Inhibition	Wright GJ, et al. 2000. <i>Immunity</i> . 13: 233 Wright GJ, et al. 2003. <i>J Immunol.</i> 171:3034 Vieites JM, et al. 2003. <i>Gene</i> . 311: 99 Hatherley D, et al. 2005. <i>J Immunol.</i> 175: 2469 Voehring D, et al. 2004. <i>J Biol Chem.</i> 279: 54117 Wright GJ, et al. 2003. <i>J Immunol.</i> 171: 3034 Hatherley D, et al. 2005. <i>J Immunol.</i> 175: 2469 Wright GJ, et al. 2003. <i>J Immunol.</i> 171: 3034 Hatherley D, et al. 2005. <i>J Immunol.</i> 175: 2469 Izawa K, et al. 2007. <i>J Biol Chem.</i> Apr 16; 282(17): 10822 Munitz A, et al. 2006. <i>J Allergy Clin Immunol.</i> 118: 10822 Kumagai H, et al. 2003. <i>Biochem Biophys Commun.</i> 307: 719 Yotsuji K, et al. 2003. <i>J Exp Med.</i> 198: 223 Bachelet I, et al. 2005. <i>J Immunol.</i> 175: 7989 Martinez-Barrio A, and Sayos J. 2006. <i>J Immunol.</i> 177: 2819
