Abstract In the literature, 630 species of Digenea (Trematoda) have been reported from Chinese marine fishes. These belong to 209 genera and 35 families. The names of these species, along with their hosts, geographical distribution and records, are listed in this paper.

Introduction

China is a country with more than 4 million km² of marine waters, including the Bohai Sea, Yellow Sea, East China Sea and South China Sea. These cover a diverse variety of climatic environments, ranging from temperate, through subtropical to equatorial tropical. This ecological environment is complex and diverse, and seasonal climatic variations can be quite dramatic. The large coastal regions provide rich

fishery resources for China, with more 3,000 species of marine fishes reported (Zhu, 1998). Due to the variety of ecological environments and fish stocks, these waters harbour large numbers of parasitic worms.

Our knowledge of the trematode parasites of Chinese marine fishes and their distribution is still limited. Tseng (1933) was the first investigator; he described eight species of digeneans of marine fishes from off Tsingtao, Shandong Province, China. Subsequently, no further investigations were made on the digenean fauna of marine fishes of China until the work of Ku & Shen (1964a). Since 1964, Gu & Shen (1976–1985), Liu (1993–2003b), Shen (1982–1995), Shen & Qiu (1995); Tang (1981), Wang (1980–1991), among others, published many studies of the digeneans of Chinese marine fishes, such that 630 species of have now been reported.

The purpose of this paper is to list the known digeneans from off the coasts of China and summarise data on their hosts, distribution in Chinese waters and records.

Methods

Table 1 was compiled from original papers. The parasite species are presented in alphabetical order under family, subfamily (where appropriate) and genus. Their hosts, geographical location of the records and references to the records and (where

Sheng-fa Liu, Wen-feng Peng, Peng Gao and Ming-jun Fu have contributed equally to the work.

YBS Yellow Sea and Bo-hai Sea, ECS East China Sea, SCS South China Sea, TWS Taiwan Strait

^a *Tormopsolus echenei* Parukhin, 1966 is probably a synonym of *Echeneidoceolium indicum* Simha & Pershad, 1964 (see Bray & Cribb, 1998)

^b The validity of this taxon was doubted by Cribb & Bray (1999), because they draw attention to the superficial resemblance between this species and certain species of the opecoelid genus *Pseudopecoeloides* Yamaguti, 1940

^c Gibson (2002) considered that *Proterometra brachyura* Wu, Lü & Zhu, 1997, *P. lamellorchis* Wu, Lü & Zhu, 1997 and *P. sillagae* Wu, Lü & Zhu, 1997 are clearly not azygiids and are likely to be lepocreadiids

^d Miller & Cribb (2008) considered “*Pseudosiphoderoides xishaensis* Gu & Shen, 1983 a species *incertae sedis* until its relationship with species in the *MetaderalSiphodera* group can be critically assessed”

^e Choudhury & Dick (1998) considered that *Skrjabinopsolus sanyaensis* Shen, 1990 does not belong to the Deropristidae

^f *Pseudocoeliodidymocystis* Shen, 1990 was considered a genus *inquirendum* by Pozdnyakov & Gibson (2008)

^g The full description of this species accompanied by a figure was given by Ku & Shen (1965a), but the species name was given by Shen (1990f)

^h *Pseudofellodistomum* Wang, 1987 was considered a genus *incertae sedis* by Bray (2008)

ⁱ *Elliptobursa* was removed from the Monorchidae and placed in the Haploporidae by Madhavi (2008) based mainly on its possession of “a single testis, a long external seminal vesicle, a well-developed prostatic complex, and a long hermaphroditic duct wrongly interpreted as a cirrus”

^j Bray (1990) considered that *Ectenurus carangis* Gu & Shen, 1978 and *E. megalaspis* Gu & Shen, 1978 may be synonymous

^k This synonymy follows Gibson & Bray (1986)

^l Bray (1991) considered that *Lecithochirium miichthydis* Wang, 1982, *L. muraenesocis* Wang, 1982 and *L. scomberomori* Wang, 1982 are probably members of other genera

^m Léon-Régagnon et al. (1996) and Bray & Cribb (2002) considered that *Opisthadena fujianensis* Tang, Shi & Guan, 1983 and *O. marina* Tang, Shi & Cao, 1983 are *species inquirendae*

ⁿ Bartoli & Gibson (2006) considered that “the description of this species is not detailed enough to confirm its genetic allocation”

^o This synonymy follows Manter & Pritchard (1960) and Bray et al. (1993)

^p This synonymy follows Gibson (2002)

^q This synonymy follows Bray & Cribb (1997)

^r Bray & Gibson (1995) treated *Lepidapedon sphyraenae* Shen, 1990 as *incertae sedis*

^s Bray & Nahhas (1998) considered that *Bianium lianyungangense* Shen, 1990 may be close to *Lepocreadioides* Yamaguti, 1936 based on the position of the genital pore, the lobation of the ovary and the host

^t Bray et al. (1997) considered that *Intusatrium crassum* Wang, 1987 is a *species inquirenda*

^u Bray & Cribb (1998) considered that “*L. pagrosomi* Wang, 1982 probably does not belong in *Lepocreadioides*, as it has an entire ovary and the genital pore, although marginal, is more posterior than is usual for the genus. The figure gives no evidence of tegumental spines or an external seminal vesicle, indicating that the species may not belong in the Lepocreadiidae”

^v Bray & Cribb (1998) considered that this species may belong in *Prodistomum* Linton, 1910, because it has blind caeca

^w Bray et al. (1993) considered that this species is possibly a synonym of *Lepocreadium clavatum* (Ozaki, 1932) Yamaguti, 1938, because it does not have the characters of *Preptetos*

Table 1 continued

^x *Allomonorchis* Lü, Wu & Chen, 1999, erected by Lü et al. (1999) for *A. huangfuensis* Lü, Wu & Chen, 1999, was originally assigned to the Monorchidae, but Madhavi (2008) considered that it is “undoubtedly a haploporid, as evidenced by the presence of a single testis, a long external seminal vesicle, a well-developed prostatic complex and a long hermaphroditic duct wrongly interpreted as a cirrus”

^y Madhavi (2008) considered *Lenolopa* Lü & Wu, 1996 as *incertae sedis*

^z *Polylecithus* Wang & Wang, 1993 was treated as *genus inquirendum* by Madhavi (2008)

^{aa} Bray & Campbell (1996) considered that this species probably belongs to *Hamacreadium* Linton, 1910

^{ab} Cribb (2005) considered that “*H. spari* Shen, 1995 is unlikely to be a genuine opistholebetid. Its reported host is a sparid and, although it is figured as possessing a well-developed postoral ring, the ovary is anomalously well posterior to the testes and the ventral sucker is unusually large”

^{ac} Cribb (2005) suggested that this species belongs in the Opecoelidae, and perhaps to *Macvicaria* Gibson & Bray, 1982, because it was recovered from a lutjanid fish and has the genital pore located sinistrally at the level of the prepharynx

^{ad} Sey et al. (2003) suggested that *Prosogonotrema caesionis* Gu & Shen, 1979 and *P. plataxum* Gu & Shen, 1979 may be synonyms of *P. bilabiatum* Pérez Vigueras, 1940

appropriate) original descriptions of the species are also listed. The classification of parasites and all of the valid scientific names of the fish hosts have been updated according to the three volumes of the ‘CABI Keys to the Trematoda’ (Gibson et al., 2002; Jones et al., 2005; Bray et al., 2008) and ‘FishBase’ (Froese & Pauly, 2009), respectively.

Mention of a digenean and its host species in this paper does not necessarily imply that we agree with its validity or identification.

Comments

From this list, it is clear that digenean parasites in Chinese marine waters have a variety of different levels of host-specificity. The majority have a single fish host, with some having two or three final hosts, but there are 13 known definitive hosts for *Erilepturus hamati* (Yamaguti, 1934).

As mentioned above, there are various ecological environments and fish hosts off the coast of China. The species of parasite listed above likely represent only a proportion of the marine digenean fauna of China. Much more effort will be required in order to describe and record the entire trematode fauna of marine fishes in this region.

Acknowledgements We would like to thank Dr Su Xinzhan of Laboratory of Malaria and Vector Research, National Institute of Allergy and Infectious Diseases, National Institutes of Health, Bethesda, Maryland, USA and Dr D.I. Gibson of the Natural History Museum, London, for their kind help with the writing and the two anonymous reviewers for their very useful comments.
