In Figs. 2(e) and 2(f) on p. 1691, the frequencies and growth rates were inadvertently plotted as a function of the flow velocity at the minimum glottal constriction ($z=1.0$), rather than the jet velocity at the flow separation point ($z=1.2$). The two velocities in this case were related by a constant factor $g/(D+g)$. The correct version of Fig. 2, with the frequencies and growth rates plotted as a function of the jet velocity in Figs. 2(e) and 2(f), is printed below.
