Received 26 February 2009; accepted 27 February 2009

Key indicators: single-crystal X-ray study;  $T = 208\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.041;  $wR$  factor = 0.115; data-to-parameter ratio = 17.4.

The title compound,  $C_{12}H_{15}N_5OS$ , was obtained by reaction of 2-(2-(methylthio)pyrimidin-4-yl)-3-oxopropanenitrile with (tetrahydrofuran-3-yl)hydrazine dihydrochloride, and the racemic product was subsequently separated by chiral chromatography (first peak;  $[\alpha]_D^{20} = +51.3^\circ$ ). The chiral center at the substituted atom of the tetrahydrofuranyl group has an *R*-configuration. The pyrimidine and pyrazolyl rings are almost coplanar, their mean planes forming a dihedral angle of  $6.4(1)^\circ$ . One of the H atoms of the amino group participates in an intramolecular hydrogen bond with the pyrimidine N atom in position 3. The second H atom is involved in an intermolecular hydrogen bond, which links the molecules into an infinite chain.

## Related literature

For the structure of a related compound with a methyl-substituted amino group, see: Liu *et al.* (2009).

**Comment**

The title compound was obtained by reaction of 2-(2-(methylthio)pyrimidin-4-yl)-3-oxopropanenitrile with (tetrahydrofuran-3-yl)hydrazine dihydrochloride. The racemic product was then separated with the help of chiral chromatography; the title compound, (I), was collected as the earlier fraction, when eluted with methanol using the Chiraldak column (99% ee;  $[\alpha]_D^{20} = +51.3^\circ$ ).

The present X-ray study unambiguously established the *R* configuration of the chiral center at the C3 atom (Fig. 1).

The pyrimidine and pyrazolyl rings lie approximately in one plane; the dihedral angle formed by their mean planes is equal to  $6.4(1)^\circ$ . The orientation of the tetrahydrofuran ring can be characterized by the dihedral angle  $99.6(1)^\circ$  formed by the pyrazolyl plane with the C2—C3—C4 plane.

The molecular geometry of (I) is similar to that of related compound with a methyl substituent at the amino group (Liu *et al.*, 2009). However, the crystal packing is substantially different as (I) has one additional H atom capable of H-bond formation. Indeed, while the H3A atom forms an intramolecular H-bond with the N5 atom of the pyrimidine ring similar to that observed in methyl-substituted structure, the H3B atom is involved in intermolecular H-bonding, which links molecules into infinite chains running along the  $\alpha$  axis (Fig. 2; Table 2).

**Experimental**

To a suspension of 2-(2-(methylthio)pyrimidin-4-yl)-3-oxopropanenitrile (13.5 g, 70.0 mmol) in AcOH (100 ml) was added (tetrahydrofuran-3-yl)hydrazine dihydrochloride (12.3 g, 70.0 mmol), and the resulting orange mixture was heated at  $80^\circ\text{C}$  under nitrogen for 3 h. Acetic acid was removed and the orange solid residue was partitioned between aqueous  $\text{Na}_2\text{CO}_3$  (200 ml) and EtOAc (400 ml). The mixture was refluxed for 30 min. The separated organic layer was washed with brine, dried over sodium sulfate and concentrated to give the crude product as a brown gum (16.82 g, 87%). The brown gum (8.32 g) was purified by flash chromatography using 30–70% EtOAc in hexane to afford a yellow solid (5.96 g).

The part of the product thus obtained (4.85 g) was subjected to chiral chromatography on Chiraldak AS—H 21.2 x 250 mm column with 35% MeOH in  $\text{CO}_2$  at 140 bar as eluent (flow = 55 ml/min; UV detection at 260 nm). Two fractions corresponding to each of the enantiomers (Peak1 and Peak2) were collected and evaporated to dryness; the specific rotation  $[\alpha]_D^{20}$  was measured in  $\text{CH}_2\text{Cl}_2$  solution and yielded the values of  $+51.3^\circ$  and  $-52.1^\circ$ , respectively. The enantiomer collected as Peak 1 was recrystallized from EtOAc/hexane to yield colorless single crystals.

## Refinement

All H atoms were placed in geometrically calculated positions (C—H 0.94 Å, 0.97 Å, 0.98 Å, and 0.99 Å for aromatic-, methyl-, methylene- and methine-H atoms, respectively; N—H 0.87 Å) and included in the refinement in the riding model approximation. The  $U_{\text{iso}}(\text{H})$  values were set to  $1.2U_{\text{eq}}$  of the carrying atom except for  $1.5U_{\text{eq}}$  for methyl-H atoms.

## Figures

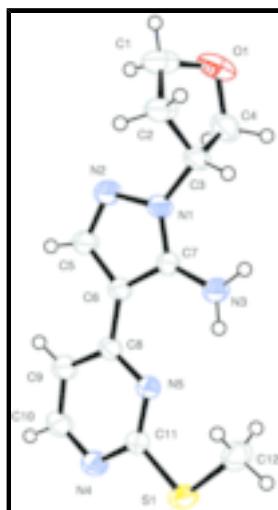

Fig. 1. Molecular structure of (I), showing 50% probability displacement ellipsoids and atom numbering scheme. H atoms are drawn as circles with arbitrary small radius.

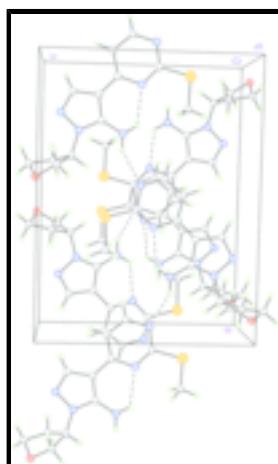

Fig. 2. Crystal packing for (I) viewed down the *b* axis; H-bonds are shown as dashed lines.

Hydrogen site location: inferred from neighbouring sites	

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

### Hydrogen-bond geometry ( $\text{\AA}$ , $^\circ$ )

$D\text{—H}\cdots A$	$D\text{—H}$	$H\cdots A$	$D\cdots A$	$D\text{—H}\cdots A$
N3—H3A…N4 <sup>i</sup>	0.87	2.19	2.9731 (19)	150
N3—H3B…N5	0.87	2.28	2.8616 (19)	124

Symmetry codes: (i)  $x-1/2, -y+1/2, -z+1$ .
