

Clarification. In the article "Sequence, tissue distribution, and differential expression of mRNA for a putative insulin-responsive glucose transporter in mouse 3T3-L1 adipocytes" by Klaus H. Kaestner, Robert J. Christy, John C. McLenithan, Lelita T. Braiterman, Peter Cornelius, Phillip H. Pekala, and M. Daniel Lane, which appeared in number 9, May 1989, of *Proc. Natl. Acad. Sci. USA* (86, 3150–3154), the authors request that the following clarification be noted. In several additional GT2 cDNA clones isolated from the same library, the underlined ambiguous sequence in Fig. 1 on p. 3151 differs and instead reads as follows, beginning with nucleotide 181:

TCT GAC GAT GGG
Ser Asp Asp Gly

The translated amino acid sequence of each of these additional cDNAs includes 508 amino acids.
