Received 23 September 2011; accepted 14 October 2011

Key indicators: single-crystal X-ray study; $T = 198$ K; mean $\sigma(C-C) = 0.005$ Å;
 R factor = 0.031; wR factor = 0.078; data-to-parameter ratio = 21.2.

The title compound, $[In_2(C_9H_{11})_4(C_4H_{10}P)_2]$, contains a centrosymmetric In_2P_2 core with short intermolecular $In-P$ bonds. This core has acute $P-In-P$ and obtuse $In-P-In$ bond angles compared with other $[R_2InPR'_2]_2$ analogues, due to the presence of the bulky aromatic substituents on the In atom and the non-sterically demanding ethyl substituents on the P atom.

Comment

Phosphanylindanes [$R_2\text{InPR}'_2$]_n form dimeric or trimeric structures in the solid state *via* intermolecular In—P coordinate bonding interactions (Beachley *et al.*, 2001; Werner & Neumuller 1996). Dimeric structures feature distorted tetrahedral geometries at indium and phosphorus, and planar four-membered In_2P_2 ring cores. In—P bond distances within the ring are similar and differ by less than 0.05 Å in all reported structures (Wells *et al.*, 1993). The structure of **I** (Fig. 1) shows a dimer in the solid state, with a characteristic In_2P_2 core and distorted tetrahedral geometries at the four coordinate indium and phosphorus centres. The In—P bond distances are similar [In—P = 2.6300 (12) Å, In— P^i = 2.6364 (9) Å] and are in the range for previously reported dimeric phosphanylindanes [2.612 (1)–2.712 (1) Å] (Wells *et al.*, 1993; Beachley *et al.*, 1993). However, the ring P—In— P^i bond angle [81.56 (3)°] is at the lower limit of the range of reported values for [$R_2\text{InPR}'_2$]₂ structures [81.80 (7)–87.53 (3)°] (Beachley *et al.*, 1987; von Hanisch, 2001), and the In—P— In^i bond angle [98.44 (3)°] is at the upper limit of reported values [92.47 (3)–98.20 (7)°] (von Hanisch, 2001; Beachley *et al.*, 1987). The significant distortion of the In_2P_2 ring is likely a result of the bulky mesityl groups on indium, which affect a compression of the P—In— P^i bond angles. Conversely, the non-bulky ethyl groups on phosphorus allows for expansion of the In—P— In^i bond angles.

Experimental

Preparation of [(2,4,6-Me₃C₆H₂)₂InPEt₂]₂ (I**)**. Trimesityl indium (0.520 g, 1.10 mmol) was added to a solution of diethyl phosphine (0.100 g, 1.10 mmol) in toluene (7.5 ml). The reaction mixture was stirred at 45°C for 72 h, after which time a white precipitate had formed. The precipitate was removed by filtration, dried *in vacuo*, and washed with toluene (2 × 5 ml) and hexane (3 ml) (yield 0.110 g, 22%). Mp: 188°C. Crystals of **I** were obtained by dissolving the product in dichloromethane and allowing the solution to sit at 23°C for 12 h.

Refinement

H atoms were included in calculated positions and refined using a riding model.

Figures

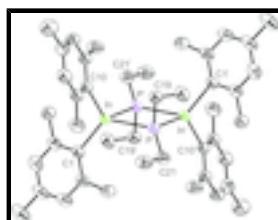

Fig. 1. X-ray crystal structure of (**I**), with displacement ellipsoids drawn at the 50% probability level. H atoms have been omitted for clarity. Symmetry transformations used to generate equivalent atoms: (i) $-x + 1/2, -y + 1/2, -z + 1$. Selected bond distances (Å) and angles (°): In—P 2.6300 (12), In— P^i 2.6364 (9), In—C1 2.190 (3), In—C10 2.215 (3), P—C19 1.866 (3), P—C21 1.856 (3), P—In— P^i 81.56 (3), In—P— In^i 98.44 (3), C1—In—C10 117.6 (1), C19—P—C21 104.4 (2).

0 restraints	$\Delta\rho_{\text{max}} = 0.65 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.34 \text{ e \AA}^{-3}$

Special details

Experimental. Crystal decay was monitored by repeating the initial 50 frames at the end of the data collection and analyzing duplicate reflections

NMR data (p.p.m., CDCl₃): ¹H NMR, 0.88 (m, 6H, PCH₂CH₃), 1.83 (q, ³J(¹H-¹H) = 7 Hz, 4H, PCH₂CH₃), 2.24 (s, 6H, 2,4,6-Me₃C₆H₂), 2.33 (s, 12H, 2,4,6-Me₃C₆H₂), 6.78 (s, 4H, 2,4,6-Me₃C₆H₂); ¹³C{¹H} 11.7 (PCH₂CH₃), 13.8 (PCH₂CH₃), 21.3 (s, 2,4,6-Me₃C₆H₂), 27.7 (s, 2,4,6-Me₃C₆H₂), 126.8 (s, 2,4,6-Me₃C₆H₂), 136.6 (s, 2,4,6-Me₃C₆H₂), 144.1 (s, 2,4,6-Me₃C₆H₂); ³¹P NMR, δ - 44.63 (s). FT—IR: 538m, 607vw, 673w, 708w, 752w, 800w, 845m, 976w, 1030w, 1042w, 1090w, 1149vw, 1244w, 1259w, 1288w, 1402w, 1547w, 1595vw, 1712vw.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.
