Accession no. X13617

Using a cDNA probe corresponding to rabbit liver cytochrome b₅ mRNA (1) we have screened a bovine λgt11 cDNA library (Clontech, Palo Alto, CA) using low stringency conditions (2) and have isolated clones for bovine liver cytochrome b₅ mRNA. The 715 base pair (bp) sequence contains an open reading frame of 402bp giving the complete amino acid sequence of bovine liver cytochrome b₅. This has enabled us to make the following corrections to the published amino acid sequence (3). The NH₂ terminal sequence is met-ala-glu-glu-ser not met-(glx,glx,ala)-ser, amino acids 16,18 and 62 are glu, gln and asn, not gln, glu and asp. The availability of this cDNA will enable studies to begin on determining the molecular relationships between the bovine liver and erythrocyte cytochrome b₅ mRNA's.
