Received 25 February 2013; accepted 5 March 2013

Key indicators: single-crystal X-ray study;  $T = 90$  K; mean  $\sigma(C-C) = 0.004 \text{ \AA}$ ;  $R$  factor = 0.043;  $wR$  factor = 0.118; data-to-parameter ratio = 13.0.

The title compound,  $C_{26}H_{25}N_3$ , crystallizes with four independent molecules, 1–4, in the asymmetric unit of the triclinic unit cell. The allyl substituents on the imidazole rings adopt similar conformations in all four molecules. The imidazole and the 4- and 5-substituted phenyl rings of two pairs of molecules in the asymmetric unit stack parallel to (110). In contrast, the dimethylaniline systems in these pairs of molecules are almost normal to one another, with dihedral angles of 85.84 (10) and 85.65 (10) $^\circ$  between the benzene rings of the two dimethylaniline fragments of molecules 1 and 2, and 3 and 4, respectively. The crystal structure features an extensive series of C—H $\cdots\pi$  interactions that link the molecules into undulating rows along the  $c$  axis. The crystal studied was a pseudo-merohedral twin with twin law [100, 010, 111] and the BASF parameter refined to 0.513 (3).

## 4-(1-Allyl-4,5-diphenyl-1*H*-imidazol-2-yl)-*N,N*-dimethylaniline

**Mehmet Akkurt, Frank R. Fronczek, Shaaban K. Mohamed, Avtandil H. Talybov, Adel A. E. Marzouk and Antar A. Abdelhamid**

### Comment

Further to our studies on the synthesis of bioactive heterocyclic molecules such as pyrimidines and fused imidazole compounds (Soliman *et al.*, 2012), thiadiazoles (Issac *et al.* 2012), acridinones and xanthenones (Mohamed, Abdelhamid *et al.*, 2012), benzoxazinones and quinazolinones (El-Sawy *et al.*, 2012), we report herein the crystal and molecular structure of the title compound.

Figure 1 shows molecule 1 and the numbering scheme, while Figure 2 identifies the four independent molecules in the asymmetric unit. The allyl substituents on the imidazole rings adopt similar conformations in all four molecules. The  $-\text{N}—\text{C}(\text{H}_2)—\text{C}(\text{H}_2)—\text{C}(\text{H}_2)$  torsion angles of the prop-1-ene substituent on the imidazole rings are  $-8.5$  (3),  $0.4$  (4),  $-9.6$  (4) and  $-1.3$  (4) $^\circ$ , respectively, for molecules 1–4. Bond lengths and angles of these four independent molecules are comparable with each other and the bond lengths are similar to values reported in the literature (Allen *et al.*, 1987).

All four of the unique molecules depart significantly from planarity. In molecule 1 (with N1), the central imidazole ring forms dihedral angles of  $26.84$  (12),  $67.62$  (13) and  $27.15$  (13) $^\circ$  with the C4–C9 benzene and C15–C20 and C21–C26 phenyl rings, respectively [the corresponding angles in molecule 2 (with N4) are  $57.03$  (12),  $66.12$  (14) and  $26.74$  (14) $^\circ$ ; molecule 3 (with N7)  $57.70$  (11),  $64.34$  (13) and  $27.27$  (13) $^\circ$ , and molecule 4 (with N10)  $26.85$  (12),  $69.03$  (13) and  $26.83$  (12) $^\circ$ ].

The imidazole and the 4- and 5-substituted phenyl rings of adjacent pairs of molecules stack parallel to (110). In contrast, the dimethylaniline systems in these pairs of molecules are almost normal to one another with dihedral angles of  $85.84$  (10) $^\circ$  between the C5–C9 and C30–C35 benzene rings of molecules 1 and 2 and  $85.65$  (10) $^\circ$  between the C56–C61 and C82–C87 benzene rings of molecules 3 and 4.

The crystal structure is stabilized by an extensive series of C—H $\cdots$  $\pi$  interactions (Table 1), that link the molecules into undulating rows along the *c* axis. Figure 3 shows the crystal packing of the title compound along the *b* axis.

### Experimental

The title compound was prepared among series of imidazole derivatives according to our reported method (Mohamed, Akkurt *et al.*, 2012). Suitable single crystals of (I) were obtained by the slow evaporation method using ethanol as a solvent. *M.p.*  $403$  –  $405$  K.

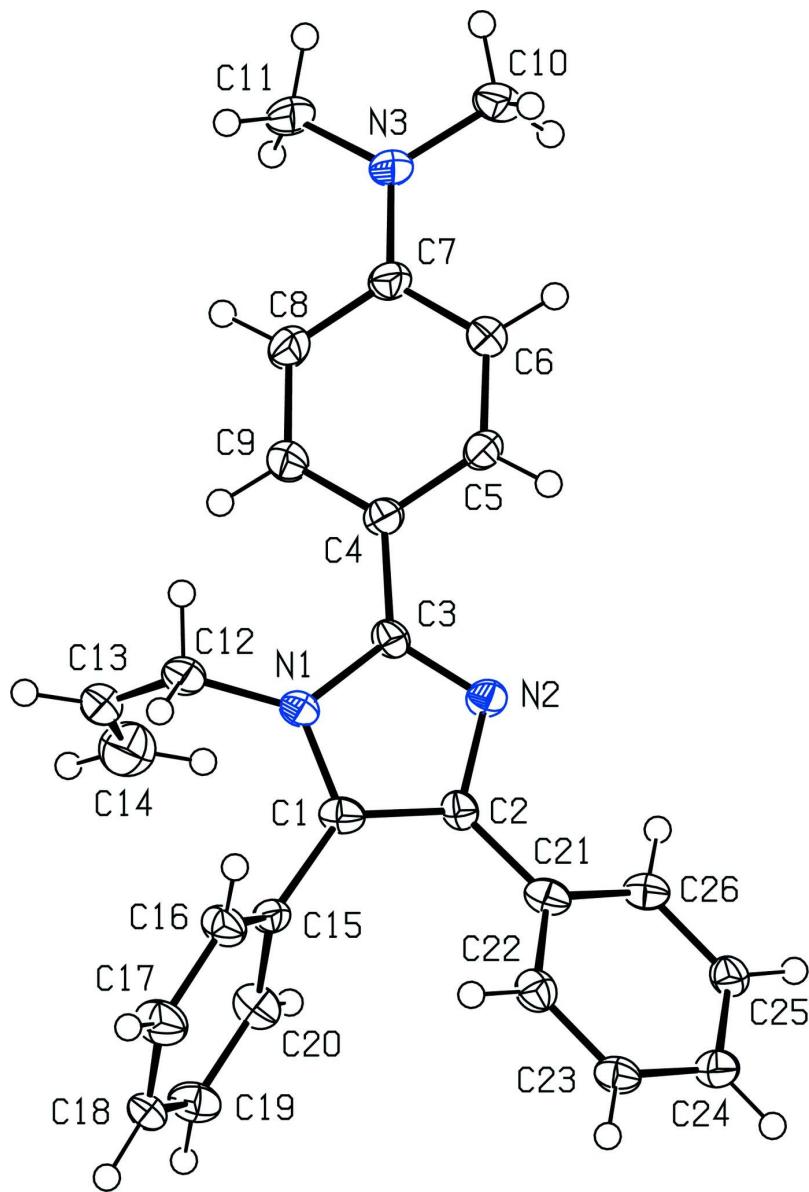

### Refinement

All H atoms were located geometrically and refined using a riding model with  $d(\text{C}—\text{H}) = 0.95$ – $0.99$  Å and,  $U_{\text{iso}}(\text{methyl H}) = 1.5 U_{\text{eq}}(\text{C})$  and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  for other H atoms. The C12, C13, C14, C38, C39, C40, C64, C65, C66, C90, C91 and C92 atoms were refined anisotropically with the  $U^{ij}$  values restrained to behave isotropically, with the ISOR instruction. The (0 - 1 10 and -1 - 1 1) reflections were probably affected by the beamstop and were omitted from the

refinement. The structure was refined as a pseudo-merohedral twin with twin law [-1 0 0, 0 - 1 0, 1 1 1]. The final refined BASF value is 0.513 (3).

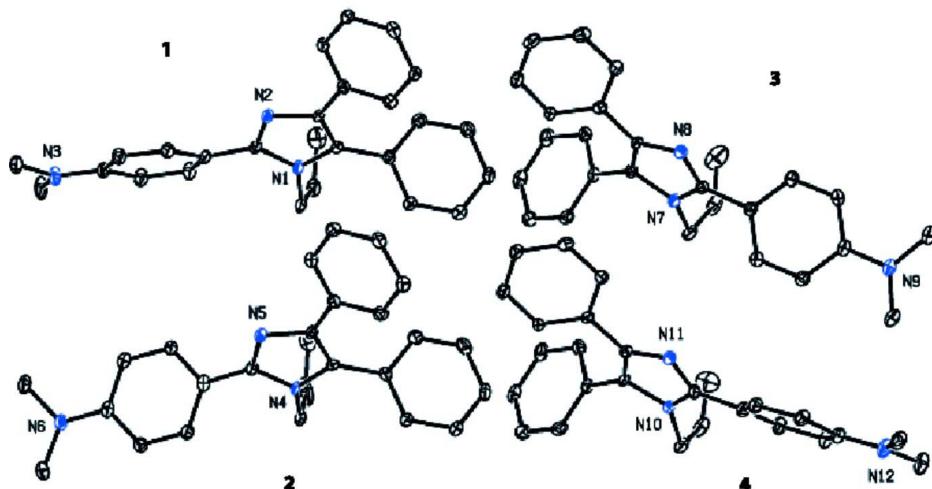

### Computing details

Data collection: *APEX2* (Bruker, 2005); cell refinement: *SAINT* (Bruker, 2005); data reduction: *SAINT* (Bruker, 2005); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *ORTEP-3 for Windows* (Farrugia, 2012); software used to prepare material for publication: *WinGX* (Farrugia, 2012) and *PLATON* (Spek, 2009).

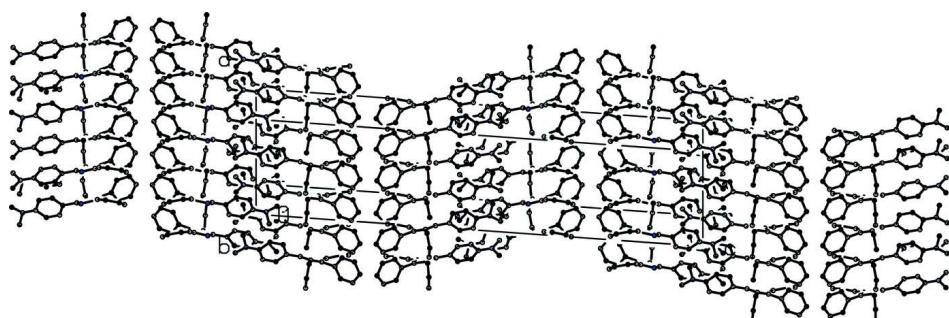

**Figure 1**

An *ORTEP* view of one of the four molecules in the asymmetric unit of the title compound. Displacement ellipsoids for non-H atoms are drawn at the 50% probability level.

**Figure 2**

A view of the four unique molecules, 1–4, in the asymmetric unit of the title compound with the the N atoms numbered for identification purposes. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level. All H atoms have been omitted for clarity.

**Figure 3**

A view of the crystal packing of the title compound along the *b* axis. All H atoms have been omitted for clarity.

 $\Delta\rho_{\max} = 0.29 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.28 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement on  $F^2$  for ALL reflections except those flagged by the user for potential systematic errors. Weighted  $R$ -factors  $wR$  and all goodnesses of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The observed criterion of  $F^2 > \sigma(F^2)$  is used only for calculating  $-R$ -factor-obs etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg2, Cg8, Cg6, Cg4, Cg10, Cg16, Cg14 and Cg12 are the centroids of the C4—C9, C47—C52, C30—C35, C21—C26, C56—C61, C99—C104, C82—C87 and C73—C78 rings, respectively.
