## Dear editor

I thank El-Charabaty et al<sup>1</sup> for their interesting paper which concludes that patients in receipt of proton pump inhibitors (PPIs) need to be followed closely for magnesium deficiency, particularly in the face of acute cardiovascular events, as this may worsen arrhythmias and hence increase the likelihood of complications. I would of course reference Faulhaber et al's recent paper that highlights the fact that hypomagnesemia in PPI use is uncommon<sup>2</sup> – but of course, uncommon does not mean never, and as such the former's conclusion is sound advice to all juniors and seniors alike.

El-Charabaty et al's transparency regarding limitations was exemplary, particularly their acknowledgment of the observational status of the study.<sup>1</sup> It would be interesting to see the results in a study drawn from an outpatient setting, as close monitoring in that domain could significantly add to the workload of primary care physicians. I also feel that diuretic use, which has been associated with PPI hypomagnesemia, could be analyzed in these settings.

To conclude, this is a relevant study, which highlights an important clinical monitoring situation.

## Disclosure

The author reports no conflicts of interest in this work.

Dovepress

## Publish your work in this journal

The International Journal of General Medicine is an international, peer-reviewed open-access journal that focuses on general and internal medicine, pathogenesis, epidemiology, diagnosis, monitoring and treatment protocols. The journal is characterized by the rapid reporting of reviews, original research and clinical studies across all disease areas.

A key focus is the elucidation of disease processes and management protocols resulting in improved outcomes for the patient. The manuscript management system is completely online and includes a very quick and fair peer-review system. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.
