Abstract

Nocardicin NRPS

Synthesized Biochemical Probes

Methods have been developed to synthesize tri- and pentapeptide thioesters containing one or more *p*-(hydroxyphenyl)glycine (pHPG) residues and *L*-serine, some where the latter is *O*-phosphorylated, *O*-acetylated or exists as a β -lactam. Selection of orthogonal protection strategies and development of conditions to achieve seryl *O*-phosphorylation without β -elimination and to maintain stereochemical control, especially simultaneously at exceptionally base-labile pHPG α -carbons, are described. Intramolecular closure of a seryl peptide to a β -lactam-containing peptide and the syntheses of corresponding thioester analogues are also reported. Modification of classical Mitsunobu conditions are described in the synthesis of the β -lactam-containing products and, in a broadly useful observation, it was found that simple exclusion of light from the P(OEt)₃-mediated Mitsunobu ring closure, afforded yields of >95%, presumably owing to reduced photodegradation of the azodicarboxylate used. These sensitive potential substrates and products will be used in

mechanistic studies of the two nonribosomal peptide synthetases NocA and NocB that lie at the heart of nocardicin biosynthesis, a family of monocyclic β -lactam antibiotics.

Introduction

Four classes of naturally-occurring β -lactam antibiotics are currently known: penicillins, for example, the naturally-occurring penicillin N (**1**) and the oxidatively related cephalosporins and cephamycins, clavulanic acid (**2**) and the antipodal clavams, carbapenem-3-carboxylic acid (**3**) and more highly elaborated carbapenems, *e.g.* thienamycin, and the monocyclic β -lactams exemplified by nocardicin A (**4**).¹ Ironically the last of these families, despite comparative structural simplicity, stubbornly remains the least understood biosynthetically. In only the last year the first experimental advances in a decade have been reported such that now central questions about how the peptide core of the nocardicins is constructed can be clearly defined. To rigorously address these questions we have developed and report here methods to prepare a series of sensitive peptide thioesters and their phosphorylated and β -lactam-containing derivatives in stereochemically controlled manner with the aim to serve as discriminating mechanistic probes of these early biochemical events.

In 2004 the gene cluster responsible for the biosynthesis of the nocardicins was isolated and characterized from *Nocardia uniformis* *ssp.* *tsuyamanensis*.² Prominent among the encoded proteins was a pair of nonribosomal peptide synthetases (NRPSs), NocA and NocB, that together house five complete modules predicted to synthesize an L,L,D,L,L-pentapeptide and whose demonstrated amino acid substrates would be expected to form **5** (Figure 2).³ It is with this discovery, however, that the key unresolved questions can be posed. First, nocardicin G (**6**), the earliest β -lactam-containing precursor of nocardicin A (**4**) contains a _{D,L,D}-tripeptide, not a pentapeptide, core, and is stereochemically inconsistent with derivation from **5**.^{4,5} With the troublesome identification of L-arginine as the amino acid specifically activated by module 2 of NocA, it would seem the initial two *N*-terminal amino acid residues of **5** are cleaved away during the biosynthesis of the antibiotic, and the *C*-terminal tripeptide arising from modules 3-5 is utilized by way of β -lactam formation and epimerization at the carboxy terminus to form nocardicin G (**6**). The timing and mechanism of precursor peptide truncation, β -lactam formation and epimerization are not known, but can be addressed experimentally by the synthesis of now definable potential substrates for the biosynthetic system as set out in the following sections.

To achieve these goals several synthetic challenges intrinsic to peptide substrates rich in pHPG residues and serine had to be addressed. The first was establishing suitable chemical conditions that prevented racemization/epimerization of the unusually base-sensitive benzylic α -center of pHPG during peptide elongation. A second and related challenge entailed the selection of suitable orthogonal protecting groups that conformed with limitations that both excluded alkaline deblocking protocols and resulted in penultimate *N*-terminally protected peptides labile to acid deprotection after final thiol coupling. Third, the seryl hydroxymethylene was to be both activated to behave as a potential electrophile and incorporated into a β -lactam ring without trivial elimination to dehydroalanine. The fourth hurdle was separation and purification of diastereomers that were unavoidably generated during thioester formation.

Results/Discussion

Synthesis of Potential Tri- and Pentapeptides in Nocardicin Biosynthesis

Nonribosomal peptide synthetases are giant modular enzymes that catalyze the assembly of a large number of bioactive peptides and peptide-derived natural products using the multiple

carrier thio-template mechanism.⁶ In the NRPS paradigm each canonical module contains at least a basis set of three domains: an adenylation (A) domain, peptidyl-carrier protein (PCP) and condensation (C) domain. The A-domain selectively recognizes and activates, with few exceptions, an L- α -amino acid in an ATP-dependent reaction (acyl-adenylation). This mixed anhydride reacts with the S-terminus of a phosphopantetheine arm, appended by post-translational modification of the PCP domain, to give rise to the amino acid-S-PCP thioesters shown in Figure 2.^{7,8} For artificial substrate mimics, the S-PCP moiety has been successfully replaced either simply by *N*-acetylcysteamine (SNAC) or more accurately by pantetheine to which the terminal synthetic peptide is attached as its thioester.^{9,10} Chain elongation is carried out by condensation (C)-domains, which catalyze peptide bond synthesis between the upstream PCP-bound thioester and the downstream PCP-bound amino acid α -amine (Figure 2). Additionally, other editing domains may be present in NRPSs including epimerization (E) domains and *N*-methylation (M) domains.¹¹ The final module found in these megasynthetases most often contains a C-terminal thioesterase (TE)-domain as seen in NocB, which catalyzes the disconnection of the full-length peptidyl chain from the adjacent PCP domain.

The modular organization of NocA/B and hypothetical stepwise assembly of the predicted L,L,D,L,L-pentapeptide **5** is illustrated in Figure 2. The stereochemistry is predicted based on the known amino acids activated in each domain¹² and the presence or absence of epimerization domains. In particular, module 3 contains an epimerase domain (E₃), presumably accounting for the *N*-terminal D-configuration of nocardicin G, while module 5 does not.

Of the three chemical events that must occur between the assembly of pentapeptide **5** and the synthesis of nocardicin G (**6**), β -lactam formation and C-terminal epimerization can only take place after the final pHPG addition in module 5. Truncation of the pentapeptide to the tripeptide core present in nocardicin G (D-pHPG-L-Ser-L-pHPG ultimately arising from modules 3-5) can logically occur before or after either or both of the other two reactions. The first synthetic task, therefore, was the preparation of two sets of peptide scaffolds varying in C-terminal stereochemistry: protected tripeptides **10a** and **10b** (D-pHPG-L-Ser-L/D-pHPG) and protected pentapeptides **16a** and **16b** (L-pHPG-L-Arg-D-pHPG-L-Ser-L/D-pHPG), each of which could then be converted to the corresponding pantetheinyl thioester, appropriately primed for future enzymatic analysis.

At the outset it was anticipated that stereochemical control of the benzylic α -positions of pHPG units would be problematic based on earlier experience with partial and total syntheses of the nocardicins and vancomycin.^{4,13,14} The pKa of the α -hydrogen of a pHPG oxyester is estimated to be ~23 compared to 26–28 for alanine or serine.¹⁵ Thioesters, however, are of particular interest in the present study and substantial depression of the pKa of the α -hydrogen of a pHPG occurs and is calculated to be ~20 for pHPG and 25–26 for alanine or serine. By extension, reductions in pKa can also be anticipated in active esters generated transiently during peptide coupling and thioester synthesis. As a consequence, orthogonal amino acid protections relied on blocking groups that could be removed by exposure to acid or by hydrogenolysis. Survey of available peptide coupling reagents demonstrated that benzotriazol-1-yl-oxytripyrrolidinophosphonium hexafluorophosphate (PyBOP) with the hindered base *N,N*-diisopropylethylamine (DIEA) was a suitable reagent combination in even the most polar of solvents including DMF, acetonitrile (ACN), and DCM, and took place without detectible epimerization in good yields. For the envisioned tri- and pentapeptides, the α -hydrogen of the pHPG units, whether L- or D- configured, were always adjacent to either, or both, L-serine and L-arginine and appeared as a simple doublet in δ_6 -DMSO owing to vicinal coupling to the adjacent amide N-H. The chemical shift of this

hydrogen in the *D*-configuration was reliably diagnostic appearing upfield compared to the *L*-diastereomer.

The synthesis of the protected tripeptides **10a** and **10b** proceeded from the *C*- to *N*-terminus in conventional fashion using *N*-Boc and benzyl protecting groups as illustrated in Scheme 1. The *p*-toluene sulfonate salt of the bis-benzyl *L*- or *D*-pHPG, **7a** and **7b** respectively, was coupled with Boc-*L*-serine, *N*-deprotected by brief TFA treatment and coupled again to Boc-*D*-(*p*-benzyloxyphenyl)glycine **9** to give the diastereomeric protected tripeptides **10a** or **10b**.

The protected pentapeptides **16a** and **16b** were synthesized in a convergent approach by combining *L,L*-dipeptide **15** with the diastereomeric tripeptides **10a** and **10b** after selective removal of blocking groups (Scheme 2). To use the commercially available *N*- α -Fmoc- N^G -(2,2,4,6,7-pentamethyldihydrobenzofuran-5-sulfonyl)-*L*-arginine (Fmoc-*L*-Arg(Pbf)-OH), it would be necessary to avoid the alkaline Fmoc deprotection in the presence of any pHPG groups or thioesters. Accordingly, Fmoc-*L*-Arg(Pbf)-OH was benzylated to **13**, converted to its corresponding free base by treatment with 20% piperidine in THF and coupled to Boc-*L*-pHPG to afford the differentially protected *L,L*-dipeptide **15**. Compound **10a** or **10b** was *N*-deblocked with TFA and joined with **15**, after hydrogenolysis, to give the protected *L,L,D,L,L/D*-pentapeptides **16a** or **16b**, respectively, with complete retention of all five stereocenters.

The benzyl protecting groups were removed from **16a** and **16b** by catalytic hydrogenation and the resulting *N*-Boc/Arg-Pbf pentapeptides were coupled to pantetheine dimethyl ketal **11**¹⁶ to give the corresponding protected thioesters. A mild aqueous workup was employed to wash away by-products and the desired Boc/Pbf-protected peptide thioester was extracted into organic solvent, concentrated *in vacuo* and re-dissolved in TFA. The final products **17a** and **17b** were purified by HPLC and lyophilized to dryness as their corresponding TFA salts. The pantetheine thioesters **12a** and **12b** (Scheme 1) were prepared analogously. While these tripeptide thioesters could be separated by HPLC, the pentapeptides **17a** and **17b** co-elute.

The generation of a mixture of diastereomers at the relatively acidic *C*-terminal pHPG α -center proved unavoidable in the syntheses of pantetheinyl and *N*-acetylcysteamyl (not shown) peptide thioesters. The peptide thioesters **12a** and **12b** could be individually purified by HPLC as noted above. When placed in 50 mM phosphate buffer, pH 7.5, the half-life of spontaneous epimerization at this α -center was estimated by HPLC analysis to be ~3 h.

Synthesis of Potential *O*-Phosphoryl and *O*-Acetyl Substrates

The β -lactam ring of nocardicin A is derived from *L*-serine in a process where no change in oxidation state occurs at the seryl β -carbon and clean stereochemical inversion is observed at this center.¹⁷⁻¹⁹ The simplest interpretation of these experimental observations, presuming the intermediacy of a peptide precursor, is intramolecular nucleophilic substitution (S_Ni) of an activated seryl-hydroxyl in an amide-containing precursor, possibly through *O*-phosphorylation or activation by some other means. Chemical support for this hypothesis came when phosphorylation of serine was mimicked *in vitro* by reaction of a protected serine-containing dipeptide under Mitsunobu conditions, generating the β -lactam rapidly at room temperature.^{4,20} *O*-Phosphorylation is a particularly attractive route of seryl activation owing to the ubiquitous utilization of ATP in NRPS systems and the metabolic intermediacy of *O*-phosphoserine.

In considering the construction of *O*-phosphoryl tripeptides **18a** and **18b** (Scheme 3), one immediate concern was ready elimination under even weakly alkaline conditions to form an undesired dehydroalanine residue. To avoid this outcome, installation of a protected *O*-phosphoryl group was achieved through the use of phosphoramidite chemistry using

tetrazole, a weak acid, in an approach analogous to oligonucleotide chemical synthesis.^{21,22} This transformation was then followed in the same pot by oxidation of the phosphite to the corresponding phosphate with a hindered hydroperoxide at low temperature to suppress potential nucleophilic displacement of the freshly generated protected *O*-phosphate and reforming the free seryl starting material.

In practice the *O*-phosphoryl functionality was installed in the protected tripeptide **10a** or **10b** by treatment with dibenzyl-*N,N*-diisopropylphosphoramidite (dibenzyl-DIPA) and 4,5-dicyanoimidazole (DCI), which was then oxidized with *tert*-butyl hydroperoxide to generate the benzyl protected *O*-phosphate analog of **18a** or **18b**. Although this reaction sequence met with great success, the final peptide coupling reaction to produce the desired products **19a** and **19b** failed under several conditions due to the presence of the seryl free phosphate and interference with coupling reagents. This failure was easily overcome by keeping the phosphate protected as an acid-labile di-*tert*-butyl-phosphate, which could be subsequently de-blocked after thiol condensation.

To this end, dibenzyl-DIPA was replaced with di-*tert*-butyl *N,N*-diisopropylphosphoramidite (di-*tert*-butyl-DIPA). Although reactions conducted with di-*tert*-butyl-DIPA and 4,5-dicyanoimidazole repeatedly failed, presumably due to a suboptimal pKa differential, substitution with tetrazole proved to be successful. However, compared to dibenzyl-phosphoramidite, reactions with di-*tert*-butyl-phosphoramidite suffered from a longer reaction time, 6 hours vs. 15 minutes, and lower yields, 64% vs. 78%. This difference most likely owes to the relatively greater steric bulk of the *tert*-butyl analog, its greater sensitivity to moisture and the lower purity of the commercial reagent.

Of practical note, purification of protected phosphoryl peptides **18a** and **18b** was conducted in two stages. First, initial purification was conducted by silica gel chromatography in which the silica was pre-treated overnight with 5% triethylamine. Chromatographic isolation of di-*tert*-butyl-phosphoryl tripeptides **18a** and **18b** without prior silica gel deactivation resulted in partial deprotection of the di-*tert*-butyl-*O*-phosphoryl blocking groups. This decomposition was evident from both the low integration of the diastereomeric *O*-*tert*-butyl groups appearing as singlets at ca. 1.3 ppm and 1.2 ppm in ¹H-NMR spectra and a downfield chemical shift of the proton- and carbon-decoupled phosphorous singlet from ca. -10 to -6 ppm in ³¹P-NMR spectra acquired in d₆-DMSO. Silica gel purification after triethylamine treatment provided the desired compounds in ~65% purity according to ¹H-NMR spectroscopy. In a second step, crystallization of either diastereomer of the partially purified product from ether-hexanes provided the desired fully protected *O*-phosphorylated compounds **18a** or **18b** as colorless fine needles in >99% purity. Each was devoid of both the diastereomeric impurity and the β-phosphate elimination product as established by ¹H-NMR spectroscopic analysis. Compounds **18a** and **18b** were then subjected to hydrogenolysis, coupled to pantetheine dimethyl ketal **11** with PyBOP and K₂CO₃ in the usual manner, and the desired thioesters **19a** and **19b** were obtained after TFA deprotection and HPLC purification as an inseparable mixture of *C*-terminal diastereomers.

In addition to *O*-phosphorylation, *O*-acetylation was also envisioned as a possible means of seryl activation *in vivo*. Tripeptides **20a** and **20b** were generated simply by reacting one equivalent of acetic anhydride in pyridine with protected tripeptide **10a** or **10b**. The protected *O*-acetyl tripeptides **20a** and **20b** were isolated in quantitative yield with no formation of diastereomers. The desired thioester substrates **21a** and **21b** were obtained by hydrogenolysis of **20a** and **20b**, respectively, followed by PyBOP coupling to pantetheine dimethyl ketal **11**, TFA deprotection and HPLC purification of the separable diastereomers.

Synthesis of Potential β -lactam Containing Thioester Substrates

The nocardicins share with penicillin N (**1**) central NRPSs that synthesize their fundamental peptide precursors. The tripeptide core of the latter, δ -(L- α -amino adipoyl)-L-cysteinyl-D-valine (ACV), is produced by and released from ACV synthetase. This L,L,D-tripeptide is doubly cyclized by isopenicillin N synthase to **1**.^{23,24} Hydrolysis of a three- or five-amino acid peptide is similarly expected from NocA/B. As noted at the outset, however, the timing of pentapeptide truncation, C-terminal epimerization and β -lactam formation is not known. As a final set of reference standards and potential substrates to examine these questions, the last synthetic goal was the preparation of two sets of pantetheinyl and β -lactam containing peptides varying in C-terminal stereochemistry: *epi*-nocardicin G- and nocardicin G-pantetheine **29a** and **29b** in addition to L-PHPG-L-Arg-*epi*-nocardicin G- and L-PHPG-L-Arg-nocardicin G-SNAC **31a** and **31b**.

The desired β -lactam peptidyl thioesters *epi*-nocardicin G-pantetheine **29a** and nocardicin G-pantetheine **29b** were first constructed as a peptide scaffold in a C- to N-terminal fashion through the central intermediacy of *tert*-butyl 3-aminocardinate (*epi*-3-ANA **25a** or 3-ANA **25b**) in a manner analogous to published nocardicin syntheses⁴ (Scheme 4). To this end, Sheehan's 4,5-diphenyl-4-oxazolin-2-one (Ox) N-protecting group was used as a means of bi-dentate ligation of the serine nitrogen, preventing competing aziridine formation in the downstream Mitsunobu cyclodehydration reaction.^{25,26} Moreover, dipeptides Ox-L-Ser-L-PHPG and Ox-L-Ser-D-PHPG, **23a** and **23b** respectively, were prepared from one unit of either L or D-*tert*-butyl-benzyloxy-PHPG (**22a** or **22b**) and Ox-L-Ser in a PyBOP mediated reaction, which provided the products in high yield with no PHPG epimerization detectable by ¹H-NMR spectroscopy. Protected β -lactam intermediates **24a** and **24b** were successfully generated from seryl-dipeptides **23a** and **23b** with retention of stereochemistry at the PHPG α -center through a modification of the classical Mitsunobu reaction procedure in which PPh₃ was replaced with P(OEt)₃; a reaction explored more fully elsewhere.^{20,27} Hydrogenolysis of **24a** or **24b** followed by aqueous acidic extraction and lyophilization afforded the desired central intermediates *epi*-3-ANA·HCl **25a** and 3-ANA·HCl **25b** respectively as white salts.

Of particular note, it was discovered here that excluding light from the modified Mitsunobu conditions allowed for reaction yields as high as 96%, an improvement from the previously reported 84% yield and a cleaner workup. It is suggested that the omission of light reduces or eliminates DEAD degradation. In a mechanistic study of the Mitsunobu esterification reaction, Hughes *et al.* discovered that in all solvents examined, formation of the DEAD and PPh₃ adduct occurs more rapidly than either the subsequent alcohol activation to form the oxyphosphonium intermediate or the ensuing S_N2 displacement.²⁸ In the present case where P(OEt)₃ is substituted for PPh₃, the formation of the adduct between DEAD and P(OEt)₃ may progress at a comparatively slower rate leaving the DEAD free to photodecompose before it is fully consumed. This factor could account for lower overall yields and product purity. In view of these observations, both reaction yields and ease of product purification for all Mitsunobu-type transformations may greatly benefit from the exclusion of light.

With the key dipeptide β -lactam-containing intermediates in hand, syntheses of the protected *epi*-nocardicin G **28a** and nocardicin G **28b** were achieved through the condensation of Boc-D-PHPG **26** and *epi*-3-ANA **25a** or 3-ANA **25b**, respectively, by way of modified Vaughan conditions for the generation of mixed anhydrides from isobutylchloroformate.²⁹ Although the reactions to form **28a** or **28b** involved amide bond formation of an unhindered carboxylic acid **26** and primary amines **25a** or **25b**, modern coupling reagents that proceed through the generation of an active ester, such as PyBOP,³⁰ COMU,³¹ EDC and DCC,³² all afforded poor (<10%) to no observable yields of product under standard conditions. To

overcome this unexpected setback, the desired protected β -lactam products **28a** and **28b** were prepared through *in situ* generation of a mixed anhydride followed by the addition of **25a** or **25b**.³³ It was found that reactions to produce protected *epi*-nocardicin G **28a** and protected nocardicin G **28b** from the condensation of **26** and either **25a** or **25b** required the addition of *N*-methylmorpholine. Production of the mixed anhydride was monitored by the reliably diagnostic precipitation of protonated 2,6-lutidine. Conversely, when *N*-methylmorpholine is omitted from the reaction, a salt does not form and amide bond formation is not observed. By supplementation with *N*-methylmorpholine according to the original Vaughan method, the desired products **28a** and **28b** were obtained in good yields.

With improved syntheses of protected nocardicin G and *epi*-nocardicin G established, the desired thioesters *epi*-nocardicin G-pantetheine **29a** and nocardicin G-pantetheine **29b** were synthesized from either diastereomer of the Boc protected nocardicin G (**28a** or **28b**) by PyBOP coupling followed by pantetheine attachment. Acidic deprotection (TFA) produced the final thioesters as a mixture of *C*-terminal diastereomers in an equilibrium ratio of 1:1.1 **29a**: **29b**. The diastereomers were separable by HPLC purification under acidic conditions. Substrates **30a** and **30b** were obtained similarly by substitution of SNAC for the pantetheine dimethyl ketal **11**.

Bearing the planned biochemical experiments in mind, the intrinsic rate of epimerization at the thioester α -center was determined by HPLC time-course analysis of purified nocardicin G-SNAC **30b** in 50 mM phosphate buffer at pH 7.5 (Figure 3). The rate of spontaneous epimerization of nocardicin G-SNAC **30b** to *epi*-nocardicin G-SNAC **30a** was measured to be $5.5 \pm 0.2 \times 10^{-4} \text{ sec}^{-1}(k_1 + k_2)$ corresponding to a half life of ~21 min. Dynamic equilibrium of the two diastereomers is achieved in less than 3 hours, resulting in a 1.1: 1 nocardicin G-SNAC: *epi*-nocardicin G-SNAC ratio. The slightly thermodynamically preferred thioester **30b** contains a *C*-terminal *D*-pHPG, identical to the biologically observed nocardicin stereoisomer. By comparison to the pantetheinyl-tripeptides **12a** and **12b**, the rate of chemical epimerization of the β -lactam containing compounds is *ca.* 10x faster.

The β -lactam-containing pentapeptides *L*-pHPG-*L*-Arg-*epi*-nocardicin G-SNAC **31a** and *L*-pHPG-*L*-Arg-nocardicin G-SNAC **31b** were synthesized in a convergent approach utilized similarly above for pentapeptides **16a** and **16b** by combining the free acid of dipeptide **15** and the free base of either *epi*-nocardicin G-SNAC **30a** or nocardicin G-SNAC **30** (Scheme 5). Unlike the previous syntheses reported here in which an *N*-Boc protected peptide intermediates were coupled to the desired thiol as the penultimate step prior to final deprotection, the synthesis of compounds **31a** and **31b** required the formation of the thioester before final amide bond condensation due to both the absence of a *C*-terminally protected carboxylic acid in compounds **28a** and **28b** and the restrictions of protecting group orthogonality resulting in an *N*-Boc protected compound. Pentapeptide β -lactams **31a** and **31b** could be obtained as a mixture of *C*-terminal diastereomers by condensation of dipeptide **15** and pre-installed SNAC thioesters **30a** or **30b**. TFA deprotection produced the desired products as a separable mixture of diastereomers, which were HPLC purified under acidic conditions.

Conclusion

Syntheses of tri- and pentapeptides incorporating seryl, *O*-phosphoseryl and β -lactam moieties have been developed to study monocyclic β -lactam antibiotic biosynthesis. The *O*-phosphoryl modification was achieved without competing formation of dehydroalanyl β -elimination products, and 4-membered ring closures of seryl residues to the β -lactam could be carried out without accompanying epimerization in a modified Mitsunobu reaction where P(OEt)₃ replaced conventionally used PPh₃.

During this phase of the work, it was observed that protection of the reaction from ambient light by wrapping the reaction flask in aluminum foil raised the yield of the Mitsunobu ring formation to >95% and simplified product isolation. We attribute the increased efficiency of this reaction to reduced photodecomposition of the DEAD reagent. Unexpected difficulty in peptide bond formation to the β -lactam β -amine could be overcome by resorting to classical mixed anhydride-mediated coupling, but only in the presence of catalytic *N*-methylmorpholine.

Through careful choice of appropriately orthogonal protecting groups, the absolute configuration of all α -centers was preserved, notably the especially acidic pHPG units, to assemble the tri- and pentapeptides **10a**, **10b** and **16a**, **16b**, respectively, with complete stereochemical control. Conversion of the *C*-terminal pHPG residue, however, to SNAC and pantetheine thioesters gave epimerization at the α -carbon that proved unavoidable, but for several of the final products, separation by HPLC was possible. Still, in aqueous buffer at room temperature, spontaneous epimerization occurred slowly in the peptide products, but ca. 10-fold more rapidly in the β -lactam thioesters with a half-life of ca. 20 minutes.

The non-proteinogenic amino acid pHPG appears often in NRPS-derived natural products apart from the nocardicins—notably the glycopeptides vancomycin, A47934, chloroeremomycin, complestatin, as well as other antimicrobial compounds such as ramoplanin and *Streptomyces* calcium-dependent antibiotics. The tactics and reaction conditions developed here will be of broader use in biosynthetic investigations of not only these pHPG-containing natural products but also those containing phenylglycine and 3,5-dihydroxyphenylglycine residues. Biochemical experiments to address the central questions of pentapeptide truncation, *C*-terminal epimerization and β -lactam formation in the biosynthesis of the nocardicins will be addressed in due course.

Experimental Section:

General Experimental Details

¹H-NMR spectra were recorded on a 400 or 600 MHz spectrometer. Proton chemical shifts are reported in ppm (δ) relative to internal tetramethylsilane (TMS, δ 0.0 ppm) or with the solvent reference relative to TMS (D₂O, δ 4.79 ppm, CDCl₃, δ 7.26 ppm, DMSO-d₆, 2.50 ppm). Data are reported as follows: chemical shift (multiplicity [singlet (s), doublet (d), triplet (t), quartet (q), and multiplet (m)], coupling constants [Hz], integration). ¹³C-NMR spectra were recorded on a 400 (101 MHz) spectrometer with complete proton decoupling. Carbon chemical shifts are reported in ppm (δ) relative to TMS with the (CD₃)₂SO (δ 39.52 ppm) or CDCl₃ (δ 77.16 ppm) as the internal standard. ³¹P-NMR spectra were recorded on a 400 (162 MHz) spectrometer with complete proton and carbon decoupling with no internal standard. High-resolution mass spectrometry was performed by either fast atom bombardment (FAB/magnetic sector) or electrospray ionization (ESI/IT-TOF). All specific rotations were acquired at 589 nm. All melting points were uncorrected. All purchased chemical were used as received.

Preparative and analytical HPLC purifications were analyzed via a multi-wavelength UV-Vis detector in conjunction with a reverse-phase C18(2) preparatory column (250 × 21.20 mm ID). Mobile phase conditions included one of the following: **Prep Method A** (water + acetonitrile (ACN) + 0.1% TFA): 0–5 min isocratic 13% water 87% ACN + 0.1% TFA, 5–25 min gradient 13% to 50% ACN + 0.1% TFA, 25–30 min 50% ACN to 13% ACN, 30–35 min isocratic 13% water 87% ACN + 0.1% TFA. Flow rate = 6.5 mL/min. **Prep Method B** (water + ACN + 0.1% TFA): 0–25 min gradient 15–80% ACN + 0.1% TFA, 25–30 min 80% to 15% ACN + 0.1% TFA, 30–35 min 15% ACN + 85% water + 0.1% TFA. Flow rate = 6.5 mL/min.

Analytical HPLC purifications were analyzed with a multi-wavelength UV-Vis detector in conjunction with a reverse phase phenyl hexyl analytical column (250 × 4.60 mm ID).

Analytical Method A (water + ACN + 0.1% TFA): 0-5 min isocratic 93% water + 7% ACN + 0.1% TFA, 5-22 min gradient 7% to 50% ACN + 0.1% TFA, 22-25 min gradient 50% to 7% ACN + 0.1% TFA, 25-35 min isocratic 93% water + 7% ACN + 0.1% TFA. Flow rate = 1.0 mL/min. **Analytical Method B** (water + ACN + 0.1% TFA): 0-20 gradient 7% to 50% ACN + 0.1% TFA, 20-25 min gradient 50% to 7% ACN + 0.1% TFA, 25-35 min isocratic 93% water + 7% ACN + 0.1% TFA. Flow rate = 1.0 mL/min.

Benzyl-L-[p-(benzyloxy)phenyl]glycine Toluenesulfonate (7a)

To a 500 mL round-bottomed flask, equipped with a magnetic stir bar, L-[p-(benzyloxy)phenyl]glycine¹⁴ (10.0 g, 38.9 mmol) was suspended in reagent grade benzyl alcohol (100 mL) and benzene (140 mL) p-toluene sulfonic acid monohydrate (8.87 g, 46.7 mmol) warmed to reflux under Dean-Stark conditions for 12 h. The solution was cooled to room temperature and added directly to 500 mL of Et₂O. The precipitate was filtered and re-suspended in 1 L of Et₂O and vigorously stirred for 1 h to remove residual benzyl alcohol. The precipitate was filtered to afford the product as a white salt (19.46 g, 96%). $[\alpha]_D^{26} = 26.3$ (c = 1.0, MeOH); **¹H-NMR** (400 MHz; DMSO-d₆): δ 8.88 (s, 3H), 7.54 (d, J = 8.1 Hz, 2H), 7.47-7.23 (m, 12H), 7.14 (d, J = 7.9 Hz, 2H), 7.08 (d, J = 8.8 Hz, 2H), 5.31 (s, 1H), 5.24, 5.19 (ABq, J_{AB} = 12.4 Hz, 2H), 5.15 (s, 2H), 2.29 (s, 3H). **¹³C-NMR** (101 MHz, DMSO-d₆): δ 168.5, 159.2, 145.3, 138.0, 136.8, 135.1, 129.8, 128.5, 128.3, 128.2, 128.1, 128.0, 127.9, 127.7, 126.6, 125.6, 124.5, 115.3, 69.3, 67.2, 63.0, 55.0, 20.9. **HRMS** (FAB) calculated for C₂₂H₂₂NO₃ 348.15997; Found 348.15966 [M+H]⁺.

Benzyl-D-[p-(benzyloxy)phenyl]glycine Toluenesulfonate (7b)

The title compound was prepared and purified analogously to compound **7a** by replacing L-[p-(benzyloxy)phenyl]glycine with D-[p-(benzyloxy)phenyl]glycine (10.0 g, 38.9 mmol). The product was obtained as a white salt (19.46 g, 96%). $[\alpha]_D^{23} = -116.3$ (c = 1.0, EtOAc). $[\alpha]_D^{26} = -21.3$ (c = 1.0, MeOH); **¹H-NMR** (400 MHz; DMSO-d₆): δ 8.88 (br s, 3H), 7.54 (d, J = 8.1 Hz, 2H), 7.47-7.23 (m, 12H), 7.14 (d, J = 7.9 Hz, 2H), 7.08 (d, J = 8.8 Hz, 2H), 5.31 (s, 1H), 5.24, 5.19 (ABq, J_{AB} = 12.4 Hz, 2H), 5.15 (s, 2H), 2.29 (s, 3H). **¹³C-NMR** (101 MHz, DMSO-d₆): δ 169.0, 159.6, 145.9, 138.3, 137.2, 135.6, 130.2, 129.0, 128.9, 128.8, 128.6, 128.5, 128.4, 128.3, 128.2, 126.9, 126.0, 125.0, 116.0, 69.7, 67.7, 63.4, 55.4, 21.3. **HRMS** (FAB) calculated for C₂₂H₂₂NO₃ 348.15997; Found 348.15923 [M+H]⁺.

N-tert-Butyloxycarbonyl-L-serine-L-[p-(benzyloxy)phenyl]glycine benzyl ester (8a)

To a 250 mL round-bottomed flask equipped with a magnetic stir bar, Boc-L-serine (4.0 g, 19.49 mmol) and DIEA (2.52 mL, 19.49 mmol) was dissolved in 30 mL of freshly distilled DCM and 10 mL of reagent grade DMF and cooled to 0 °C in an ice-bath. In a separate flask **7a** (10.12 g, 19.49 mmol) was dissolved in 30 mL of reagent grade DMF and to this suspension was added DIEA (5.03 mL, 38.98 mmol) and cooled to 0 °C with an ice-bath. When both solutions had come to temperature, PyBOP (11.16 g, 21.49 mmol) was added to the flask containing Boc-L-Ser. After 1 min, the amine solution containing **7a** was added drop-wise over 2 min to the activated carboxylic acid and the reaction mixture was allowed to stir at 0 °C to room temperature for 3 h. The solution was diluted with 200 mL of EtOAc and washed with sat. aq. NH₄Cl (2 × 75 mL), sat. aq. NaHCO₃ (2 × 75 mL) and brine (1 × 75 mL). The organic layer was concentrated *in vacuo* and purified by silica gel chromatography with a gradient of 40: 60 EtOAc: Hex to 50: 50 EtOAc: Hex over 3 L to obtain the product as a white foam (7.87g, 76%). $[\alpha]_D^{22} = 42.8$ (c = 1.0, EtOAc); **¹H-NMR** (400 MHz; DMSO-d₆): δ 8.55 (d, J = 6.8 Hz, 1H), 7.46-7.21 (m, 12H), 7.00 (d, J = 8.8 Hz, 2H), 6.75 (d, J = 8.4 Hz, 1H), 5.41(d, J = 6.8 Hz, 1H), 5.13, 5.10 (ABq, J_{AB} = 12.8 Hz, 2H),

5.12 (s, 2H), 4.80 (t, $J = 5.8$ Hz, 1H), 4.11 (q, $J = 6.2$ Hz, 1H), 3.61–3.56 (m, 1H), 3.53–3.47 (m, 1H), 1.37 (s, 9H). **$^{13}\text{C-NMR}$** (101 MHz, DMSO- d_6): δ 170.4, 170.3, 158.3, 155.2, 137.0, 136.7, 129.0, 128.4, 128.3, 128.2, 128.0, 127.8, 127.6, 127.5, 114.9, 78.2, 69.2, 66.2, 61.9, 56.6, 55.7, 28.2. **HRMS** (FAB) calculated for $\text{C}_{30}\text{H}_{34}\text{N}_2\text{O}_7$ 535.2443; Found 535.24361 $[\text{M}+\text{H}]^+$.

***N-tert*-Butyloxycarbonyl- l -serine- d -[*p*-(benzyloxy)phenyl]glycine benzyl ester (8b)**

The title compound was prepared and purified analogously to compound **8a** by replacing **7a** with **7b** (10.0 g, 49.4 mmol). The product was obtained as a white foam (7.87g, 76%). $[\alpha]_D^{22} = -43.2$ ($c = 1.0$, EtOAc); **$^1\text{H-NMR}$** (400 MHz; DMSO- d_6): δ 8.57 (d, $J = 7.2$ Hz, 1H), 7.47–7.23 (m, 12H), 7.01 (d, $J = 8.8$ Hz, 2H), 6.68 (d, $J = 8.4$ Hz, 1H), 5.44 (d, $J = 7.2$ Hz, 1H), 5.14, 5.12 (ABq, $J_{AB} = 12.7$ Hz, 2H), 5.12 (s, 2H), 4.87 (br t, $J = 5.8$ Hz, 1H), 4.18 (br q, $J = 6.9$ Hz, 1H), 3.56 (t, $J = 5.6$ Hz, 2H), 1.40 (s, 9H). **$^{13}\text{C-NMR}$** (101 MHz, DMSO- d_6): δ 170.9, 170.8, 158.7, 155.6, 137.5, 136.2, 129.3, 128.9, 128.8, 128.7, 128.4, 128.3, 128.1, 128.0, 115.4, 78.7, 69.7, 66.7, 62.5, 56.9, 56.2, 28.6. **HRMS** (FAB) calculated for $\text{C}_{30}\text{H}_{34}\text{N}_2\text{O}_7$ 535.2443; Found 535.24288 $[\text{M}+\text{H}]^+$.

***N-tert*-Butyloxycarbonyl- d -*p*-(benzyloxy)phenyl]glycine (9)**

To a 500 mL Erlenmeyer flask equipped with a magnetic stir bar, d -[*p*-(benzyloxy)phenyl]glycine (10.00 g, 38.87 mmol) was dissolved in 250 mL of 0.5 M NaOH (aq.) and to this solution was added di-*tert*-butyl dicarbonate (9.33 g, 42.75 mmol) in 300 mL of reagent grade THF. The reaction was stirred at room temperature for 12 h. The mixture was transferred to a 1-L separatory flask and the THF was partitioned from the aqueous fraction with 200 mL of Et₂O and removed. The aqueous layer was transferred to a 1-L Erlenmeyer flask, cooled to 0 °C in an ice-bath and acidified to pH 2.0 with conc. HCl. The acidified aqueous mixture was extracted with EtOAc (3 × 100 mL), the organic extractions were pooled and washed with brine (1 × 75 mL) and concentrated *in vacuo* to afford the product as a white foam (10.28 g, 74%). $[\alpha]_D^{25} = -93.3$ ($c = 1.0$, MeOH). **$^1\text{H-NMR}$** (400 MHz; DMSO- d_6): δ 7.44–7.30 (m, 8H), 6.96 (d, $J = 8.8$ Hz, 2H), 5.08 (s, 2H), 5.02 (d, $J = 8.0$ Hz, 1H), 1.38 (s, 9H). **$^{13}\text{C-NMR}$** (101 MHz, DMSO- d_6): δ 172.6, 157.9, 155.1, 137.1, 130.3, 128.9, 128.5, 127.8, 127.6, 114.5, 78.2, 69.2, 57.3, 28.2. **HRMS** (FAB) calculated for $\text{C}_{20}\text{H}_{23}\text{NO}_5$ 358.16545; Found 358.16500 $[\text{M}+\text{H}]^+$.

***N-tert*-Butyloxycarbonyl- d -[*p*-(benzyloxy)phenyl]glycine- l -serine- l -[*p*-(benzyloxy)phenyl]glycine benzyl ester (10a)**

To a 250 mL round-bottomed flask equipped with a magnetic stir bar, **8a** (7.87 g, 14.72 mmol) was dissolved in 100 mL of a 1:3 DCM: TFA solution and stirred at room temperature for 30 min. The solution was concentrated *in vacuo* and residual TFA was removed by azeotropic distillation with toluene (2 × 75 mL) and placed under high vacuum for 20 min.

In a separate 250 mL round-bottomed flask equipped with a magnetic stir bar, **9** (5.26 g, 14.72 mmol) and DIEA (2.56 mL, 14.72 mmol) were dissolved in 30 mL of reagent grade DMF and cooled to 0 °C in an ice-bath. The freshly deprotected **8a** was separately dissolved in 30 mL of reagent grade DMF, DIEA (5.12 mL, 29.44 mmol) was added and the solution was cooled to 0 °C in an ice-bath. When both solutions were sufficiently cooled, PyBOP (11.16 g, 21.49 mmol) was added to the flask containing **9**. After 1 min the solution containing **8a** was added drop-wise over 2 min to the activated carboxylic acid and the reaction was allowed to stir 0 °C to room temperature for 3 h. The reaction was diluted with 200 mL of EtOAc and washed with sat. aq. NH₄Cl (2 × 75 mL), sat. aq. NaHCO₃ (2 × 75 mL) and brine (1 × 75 mL). The organic layer was concentrated *in vacuo* and the product

was purified by silica gel chromatography with a gradient of 60: 40 EtOAc: Hex to 70: 30 EtOAc: Hex over 3 L to afford the product as a white foam (8.00g, 70%). $[\alpha]_D^{25} = 0.2$ ($c = 1.0$, EtOAc); **¹H-NMR** (400 MHz; DMSO- d_6): δ 8.64 (d, $J = 6.4$ Hz, 1H), 8.24 (d, $J = 7.6$ Hz, 1H), 7.44-7.23 (m, 20H), 7.01 (d, $J = 8.8$ Hz, 2H), 6.94 (d, $J = 8.8$ Hz, 2H), 5.42 (d, $J = 6.8$ Hz, 1H), 5.22 (d, $J = 8.4$ Hz, 1H), 5.11 (s, 4H), 5.07 (s, 2H), 4.87 (t, $J = 5.3$ Hz, 1H), 4.41 (br q, $J = 6.6$ Hz, 1H), 3.55 (br t, $J = 5.3$ Hz, 2H), 1.36 (s, 9H). **¹³C-NMR** (101 MHz, DMSO- d_6): δ 170.4, 170.3, 169.9, 158.3, 157.7, 154.8, 154.8, 137.1, 137.0, 135.8, 131.2, 129.1, 128.5, 128.5, 128.4, 128.3, 128.0, 128.0, 127.9, 127.8, 127.6, 127.6, 127.5, 114.9, 114.4, 78.4, 69.2, 69.2, 66.1, 61.6, 57.1, 55.9, 54.8, 28.2. **HRMS** (FAB) calculated for $C_{45}H_{45}N_3O_9$ 774.33906; Found 774.33708 $[M+H]^+$.

***N*-tert-Butyloxycarbonyl-*D*-[*p*-(benzyloxy)phenyl]glycine-*L*-serine-*D*-[*p*-(benzyloxy)phenyl]glycine benzyl ester (10b)**

The title compound was prepared and purified analogously to compound **10a** by replacing **8a** with **8b** (7.87 g, 14.72 mmol). The product was obtained as a white foam (8.23 g, 72%). $[\alpha]_D^{25} = -62.0$ ($c = 1.0$, EtOAc); **¹H-NMR** (400 MHz; DMSO- d_6): δ 8.66 (d, $J = 6.9$ Hz, 1H), 8.23 (d, $J = 7.8$ Hz, 1H), 7.46 7.23 (m, 20H), 7.01 (d, $J = 8.8$ Hz, 2H), 6.93 (d, $J = 8.8$ Hz, 2H), 5.45 (d, $J = 7.1$ Hz, 1H), 5.24 (d, $J = 8.1$ Hz, 1H), 5.16, 5.13 (ABq, $J_{AB} = 12.5$ Hz, 2H), 5.12 (s, 2H), 5.08 (s, 2H), 4.90 (t, $J = 5.2$ Hz, 1H), 4.44 (br q, $J = 6.1$ Hz, 1H), 3.56-3.44 (m, $J = 5.2$ Hz, 2H), 1.36 (s, 9H). **¹³C-NMR** (101 MHz, DMSO- d_6): δ 170.8, 170.4, 158.7, 158.2, 137.55, 137.5, 136.2, 131.5, 129.4, 129.0, 128.92, 128.89, 128.83, 128.79, 128.6, 128.4, 128.32, 128.28, 128.1, 128.0, 115.3, 114.9, 78.9, 69.69, 69.65, 66.6, 62.2, 56.3, 55.2, 28.6. **HRMS** (FAB) calculated for $C_{45}H_{47}N_3O_9$ 774.33906; Found 774.33786 $[M+H]^+$.

Pantetheine dimethyl ketal (11)

To a 500 mL round-bottomed flask, equipped with a magnetic stir bar, *D*-pantothenic acid hemicalcium salt (5.00 g, 10.49 mmol), *p*-toluenesulfonic acid monohydrate (4.79 g, 25.18 mmol) and 5.00 g of 3 Å Å molecular sieves were suspended in 250 mL of reagent grade acetone. The flask was capped and the suspension was stirred at room temperature for 12 h. The thick slurry was filtered through Celite and washed with 3 × 100 mL of acetone and the filtrate was concentrated to a viscous oil. The oil was dissolved in 200 mL of EtOAc, washed with brine (2 × 100 mL) and further dried with Na_2SO_4 . The EtOAc was removed *in vacuo* and just before the EtOAc was fully removed, hexane was added slowly to precipitate a solid that was dried under high vacuum and used in the next step without further purification.

To a 250 mL round-bottomed flask equipped with a magnetic stir bar, freshly prepared *D*-pantothenic dimethyl ketal (3.69 g, 14.23 mmol) was dissolved in 90 mL of freshly distilled THF, and treated with 1',1'-carbonyldiimidazole (3.46 g, 21.34 mmol) and stirred for 1 h at room temperature. To this solution was added cysteamine hydrochloride (2.42 g, 21.34 mmol) and stirred at room temperature for 12 h. The THF was concentrated *in vacuo* and 100 mL of DCM was added. The organic solution was washed sat. aq. NH_4Cl (1 × 50 mL) and brine (1 × 50 mL), dried with Na_2SO_4 filtered and concentrated to an oil. The oil was purified by silica gel flash chromatography with a mobile phase of 70:30 EtOAc: Hex to 100% EtOAc to produce the desired product as a white solid (2.71 g, 81%). $[\alpha]_D^{23} = 33.4$ ($c = 1.0$, MeOH). **¹H-NMR** (400 MHz; $CDCl_3$): δ 7.1 (t, $J = 5.8$ Hz, 1H), 6.62 (t, $J = 5.1$ Hz, 1H), 4.03 (s, 1H), 3.64 (d, $J = 11.6$ Hz, 1H), 3.51 (qd, $J = 12.3, 6.4$ Hz, 2H), 3.38 (qd, $J = 13.5, 6.4$ Hz, 2H), 3.23 (d, $J = 11.7$ Hz, 1H), 2.61 (dtd, $J = 8.4, 6.6, 1.8$ Hz, 2H), 2.43 (t, $J = 6.2$ Hz, 2H), 1.41 (s, 3H), 1.38 (s, 3H), 1.36 (t, $J = 8.5$ Hz, 1H), 0.98 (s, 3H), 0.92 (s, 3H). **¹³C-NMR** (101 MHz, $CDCl_3$): δ 171.2, 170.30, 99.1, 77.2, 71.4, 42.5, 36.1, 35.0, 33.0,

29.5, 24.5, 22.2, 18.9, 18.6. **HRMS** (FAB) calculated for C₁₄H₂₆N₂O₄S 319.1692; Found 319.16924 [M+H]⁺.

D-[p-(Hydroxy)phenyl]glycine-L-serine-L-[p-(hydroxy)phenyl]glycyl-pantetheine (12a)

To a 250 mL pressure flask, protected tripeptide **10a** (580 mg, 0.75 mmol) was dissolved in 20 mL of reagent grade THF and to it this solution was added a catalytic amount of Pd-OH/C. The mixture was vigorously shaken under 50 psi of H₂ overnight on a Parr hydrogenator apparatus. The mixture was filtered through Celite, which was washed with 200 mL of THF and concentrated *in vacuo* to a white foam and used in the next step without further purification.

To a 25 mL round-bottomed flask equipped with a magnetic stir bar, the freshly deprotected tripeptide (380 mg, 0.75 mmol) was dissolved in 5 mL of reagent grade DMF. To this solution was added K₂CO₃ (291 mg, 2.27 mmol) and PyBOP (471 mg, 0.91 mmol) followed by **11**, and the reaction mixture was stirred at room temperature for 1 h. The solution was diluted with 35 mL of EtOAc and washed with sat. aq. NH₄Cl (2 × 15 mL), sat. aq. NaHCO₃ (1 × 15 mL) and concentrated *in vacuo*. The residue was re-dissolved in 2.0 mL of 1:1 ACN: H₂O and purified according to Prep Method B as a mixture of diastereomers. The product was collected, frozen on dry ice and lyophilized to dryness. The lyophilized powder was dissolved in TFA for 10 min, concentrated *in vacuo*, re-dissolved in 2 mL of 80: 20 H₂O: ACN with 0.1% TFA and purified with Prep Method B. The product was collected, frozen on dry ice and lyophilized to dryness to afford the product as the white TFA salt (205 mg, 35%). Isolation of 2 mg of diastereomerically pure material was achieved using Analytical Method A. **¹H-NMR** (400 MHz; D₂O): δ 7.24 (d, *J* = 8.8 Hz, 2H), 7.23 (d, *J* = 8.8 Hz, 2H), 6.86 (d, *J* = 8.8 Hz, 2H), 6.84 (d, *J* = 8.8 Hz, 2H), 6.46 (s, 1H), 5.04 (s, 1H), 4.42 (X of ABX, *J* = 6.4, 4.8 Hz, 1H), 3.86 (s, 1H), 3.74 (AB of ABX, *J* = 11.6, 6.4, 4.8 Hz, 2H), 3.39 (d, *J* = 11.2 Hz, 1H), 3.27 (d, *J* = 11.2 Hz, 1H), 3.29-3.24 (m, 4H), 2.99 (app t, *J* = 5.9 Hz, 2H), 2.17 (app td, *J* = 6.6, 1.8 Hz, 2H), 0.80 (s, 3H), 0.76 (s, 3H). **¹³C-NMR** (101 MHz, D₂O): δ 201.1, 175.0, 173.9, 171.2, 169.0, 163.2, 162.8, 157.2, 156.4, 129.8, 129.7, 126.3, 123.5, 116.3, 116.0, 75.7, 68.4, 63.5, 60.8, 56.0, 55.5, 38.6, 38.3, 35.3, 35.1, 28.1, 20.5, 19.1. **HRMS** (FAB) calculated for C₃₀H₄₁N₅O₁₀S 664.26524; Found 664.26512 [M+H]⁺.

D-[p-(Hydroxy)phenyl]glycine-L-serine-D-[p-(hydroxy)phenyl]glycyl-pantetheine (12b)

The title compound was prepared and purified analogously to compound **12a** by replacing **10a** with **10b** (580 mg, 0.75 mmol). The product was obtained as the TFA salt (229 mg, 39%). Isolation of 2 mg of diastereomerically pure material was achieved using Analytical Method A. **¹H-NMR** (400 MHz; D₂O): δ 7.29 (d, *J* = 8.7 Hz, 2H), 7.23 (d, *J* = 8.7 Hz, 2H), 6.89 (d, *J* = 8.7 Hz, 2H), 6.84 (d, *J* = 8.7 Hz, 2H), 5.46 (s, 1H), 5.07 (s, 1H), 4.48 (t, *J* = 5.6 Hz, 1H), 3.87 (s, 1H), 3.63 (d, *J* = 5.6 Hz, 2H), 3.40 (d, *J* = 11.2 Hz, 1H), 3.30-3.26 (m, 5H), 3.04-2.97 (m, 2H), 2.19 (app td, *J* = 6.5, 2.1 Hz, 2H), 0.81 (s, 3H), 0.77 (s, 3H). **¹³C-NMR** (101 MHz, D₂O): δ 201.0, 175.0, 173.9, 171.2, 169.0, 157.2, 156.4, 129.8, 129.7, 126.3, 123.5, 123.5, 116.3, 116.0, 75.7, 68.4, 63.6, 60.8, 56.1, 55.4, 38.6, 38.3, 35.1, 28.1, 20.5, 19.1. **HRMS** (FAB) calculated for C₃₀H₄₁N₅O₁₀S 664.26524; Found 664.26484 [M+H]⁺.

N-α-Fmoc-N^ε-(2,2,4,6,7-pentamethylidihydrobenzofuran-5-sulfonyl)-L-arginine benzyl ester (13)

To a 500 mL round-bottomed flask equipped with a magnetic stir bar, Fmoc-L-Arg(Pbf)-OH (20.0 g, 30.83 mmol) was dissolved in 100 mL of freshly distilled DCM. To this solution was added DIEA (6.44 mL, 37.00 mmol), benzyl bromide (4.39 mL, 36.99 mmol) and a

catalytic amount of DMAP (376 mg, 3.08 mmol). The reaction mixture was stirred at room temperature for 12 h. The solution was concentrated *in vacuo* and the crude product was directly purified by silica gel chromatography with 80: 20 DCM: acetone to afford the product as a white foam (4.47 g, 20%). $[\alpha]_D^{25} = -0.68$ ($c = 1.0$, EtOAc); $^1\text{H-NMR}$ (400 MHz; DMSO- d_6): δ 7.89 (d, $J = 7.5$ Hz, 2H), 7.85-7.83 (m, 1H), 7.71 (d, $J = 7.5$ Hz, 2H), 7.43-7.40 (m, 2H), 7.35-7.30 (m, 6H), 6.69 (br s, 1H), 6.45 (br s, 1H), 5.10 (s, 2H), 4.34-4.27 (m, 2H), 4.22 (t, $J = 7.0$ Hz, 1H), 4.08-4.04 (m, 1H), 3.36 (s, 1H), 3.06-3.02 (m, 2H), 2.91 (s, 2H), 2.50 (s, 3H), 2.44 (s, 3H), 1.99 (s, 3H), 1.73 (br s, 1H), 1.63 (br s, 1H), 1.45 (br s, 2H), 1.38 (s, 3H), 1.38 (s, 3H). $^{13}\text{C-NMR}$ (101 MHz, DMSO- d_6): δ 172.1, 157.4, 156.1, 143.8, 143.7, 140.7, 137.3, 135.9, 131.4, 128.9, 128.4, 128.0, 127.7, 127.3, 127.1, 125.2, 125.2, 124.3, 121.4, 120.1, 120.0, 116.3, 109.7, 86.3, 65.9, 65.7, 53.8, 46.6, 42.5, 28.3, 19.0, 17.6, 12.3. **HRMS** (FAB) calculated for $\text{C}_{41}\text{H}_{46}\text{N}_4\text{O}_7\text{S}$ 739.31655; Found 739.31607 $[\text{M}+\text{H}]^+$.

***tert*-Butyl-L-[*p*-(hydroxy)phenyl]glycine (14)**

To a 1 L Erlenmeyer flask equipped with a magnetic stir bar, L-[*p*-(hydroxy)phenyl]glycine (20.00 g, 119.57 mmol) was dissolved in 300 mL of 1.0 M NaOH and to this solution was added di-*tert*-butyl dicarbonate (31.31 g, 143.48 mmol) in 500 mL of reagent grade THF. Reaction was stirred at room temperature for 12 h. The mixture was transferred to a 1 L separatory funnel and the THF was partitioned with 200 mL Et₂O and removed. The aqueous layer was transferred to a 1 L Erlenmeyer flask, cooled to 0 °C with an ice-bath and acidified to pH 2.0 with conc. HCl. The acidified aqueous mixture was extracted with EtOAc (3 × 100 mL), the organic extractions were pooled, washed with brine (1 × 75 mL) and concentrated *in vacuo* to a viscous oil. The product was crystallized as a white solid from EtOAc/Hex (24.92 g, 78%). mp 203 °C; $[\alpha]_D^{24} = 131.87$ ($c = 1.0$, MeOH). $^1\text{H-NMR}$ (400 MHz; DMSO- d_6): δ 9.46 (br s, 1H), 7.37 (d, $J = 8.1$ Hz, 1H), 7.19 (d, $J = 8.6$ Hz, 2H), 6.73 (d, $J = 8.6$ Hz, 2H), 4.98 (d, $J = 8.1$ Hz, 1H), 1.39 (s, 9H). $^{13}\text{C-NMR}$ (101 MHz, DMSO- d_6): δ 172.9, 157.1, 155.3, 129.1, 127.6, 115.2, 78.4, 57.2, 28.3. **HRMS** (FAB) calculated for $\text{C}_{13}\text{H}_{17}\text{NO}_5$ 268.11850; Found 268.11832 $[\text{M}+\text{H}]^+$.

***N-tert*-Butyloxycarbonyl-L-[*p*-(hydroxy)phenyl]glycine-L-arginine(Pbf) benzyl ester (15)**

To a 250 mL round-bottomed flask equipped with a magnetic stir bar, compound **13** was dissolved in 60 mL of freshly distilled THF. Reagent grade piperidine (6 mL) was added and the solution was stirred at room temperature for 30 min. The contents of the flask were concentrated *in vacuo* and excess piperidine was removed by azeotropic distillation with toluene (2 × 100 mL) and further dried under high vacuum to afford a white solid. After 30 min, the solid was dissolved in 15 mL of freshly distilled DCM and cooled to 0 °C with an ice-bath.

In a separate flask 250 mL round-bottomed flask, **14** (1.94 g, 7.26 mmol) was dissolved in 15 mL of freshly distilled DCM and cooled to 0 °C in an ice-bath and DIEA (3.16 mL, 18.15 mmol) was added. When the solution was sufficiently cooled, PyBOP (3.78 g, 7.26 mmol) was added and the solution containing the free-amine corresponding to compound **13** was transferred dropwise over 3 min. The reaction was stirred at 0 °C to room temperature over 3 h. The solution was concentrated *in vacuo* and re-dissolved in 200 mL of EtOAc, washed with sat. aq. NH₄Cl (2 × 30 mL), sat. aq. NaHCO₃ (2 × 30 mL) and 1 × 30 mL brine. The organic solution was concentrated *in vacuo* and the product was purified by silica gel chromatography using a gradient 70: 30 EtOAc: Hex to 80: 20 EtOAc: Hex over 2 L. The desired product was isolated as a white foam (1.99 g, 43%). $[\alpha]_D^{25} = 31.8$ ($c = 1.0$, EtOAc); $^1\text{H-NMR}$ (400 MHz; DMSO- d_6): δ 9.38 (s, 1H), 8.48 (d, $J = 7.4$ Hz, 1H), 7.37-7.23 (m, 5H), 7.19 (d, $J = 8.6$ Hz, 2H), 7.09 (d, $J = 8.8$ Hz, 1H), 6.69 (d, $J = 8.6$ Hz, 2H), 6.45 (br s, 1H), 5.14 (d, $J = 8.8$ Hz, 1H), 5.03-5.01 (m, 2H), 4.31 (br q, $J = 6.7$ Hz, 1 H),

3.05 (q, $J = 6.5$ Hz, 2H), 2.50 (s, 3H), 2.45 (s, 3H), 2.01 (s, 3H), 1.78-1.66 (m, 1 H), 1.65-1.55 (m, 1 H), 1.43 (s, 3H), 1.40 (s, 3H), 1.38 (s, 9H). $^{13}\text{C-NMR}$ (101 MHz, DMSO- d_6): δ 171.88, 171.1, 157.9, 157.3, 156.5, 155.3, 137.7, 136.2, 131.9, 129.2, 128.9, 128.9, 128.5, 128.4, 128.2, 124.8, 116.8, 115.4, 86.7, 78.8, 66.4, 57.4, 52.3, 43.0, 31.1, 28.8, 28.6, 19.5, 18.1, 12.8. **HRMS** (FAB) calculated for $\text{C}_{39}\text{H}_{51}\text{N}_5\text{O}_9\text{S}$ 766.34858; Found 766.34757 $[\text{M}+\text{H}]^+$.

***N*-tert-Butyloxycarbonyl-L-[*p*-(hydroxy)phenyl]glycine-L-arginine(Pbf)-D-[*p*-(benzyloxy)phenyl]glycine-L-serine-L-[*p*-(benzyloxy)phenyl]glycine benzyl ester (16a)**

To a 250 mL round-bottomed flask equipped with a magnetic stir bar, compound **15** (1.15 g, 1.31 mmol) was dissolved in 30 mL of reagent grade THF. To this solution was added a catalytic amount of Pd-OH/C and the dipeptide was hydrogenated under 1 atm. of H_2 for 12 h. The mixture was filtered through Celite, washed with THF (3×50 mL) and the organic filtrate was concentrated *in vacuo* and used in the next reaction without further purification. In a separate 250 mL round-bottomed flask equipped with a magnetic stir bar, tripeptide **10a** (1.11 g, 1.43 mmol) was dissolved in 60 mL of TFA and stirred at room temperature for 30 min. The solution was concentrated *in vacuo* and the solvents were removed by azeotropic distillation with toluene (3×50 mL).

To a third 250 mL round-bottomed flask equipped with a magnetic stir bar, the freshly deprotected compound **15** was added in 30 mL of reagent grade DMF. To this was added DIEA (228 μL , 1.31 mmol) and the solution was cooled to 0 $^\circ\text{C}$ in an ice-bath. The freshly deprotected peptide corresponding to compound **10a** was dissolved in 20 mL of reagent grade DMF, DIEA (456 μL , 2.62 mmol) was added and the solution was cooled to 0 $^\circ\text{C}$ in an ice-bath. After both solutions were sufficiently cooled, PyBOP (747 mg, 1.43 mmol) was added to the flask containing freshly deprotected dipeptide **15** and after 1 min, freshly deblocked **10a** was added dropwise over 2 min. The reaction mixture was stirred from 0 $^\circ\text{C}$ to room temperature over 3 h. The reaction mixture was diluted with 150 mL of EtOAc and washed with sat. aq. NH_4Cl (2×75 mL), sat. aq. NaHCO_3 (2×75 mL) and brine (1×75 mL). The organic solution was concentrated *in vacuo* and the product was purified by silica gel chromatography with 98: 2 EtOAc: MeOH to afford the product as a white foam (733 mg, 42%). $[\alpha]_D^{25} = -20.7$ ($c = 1.0$, MeOH). $^1\text{H-NMR}$ (400 MHz; DMSO- d_6): δ 9.40 (s, 1H), 8.77 (d, $J = 7.2$ Hz, 1H), 8.45 (d, $J = 8.0$ Hz, 1H), 8.42 (d, $J = 7.6$ Hz, 1H), 8.16 (d, $J = 8.0$ Hz, 1H), 7.46-7.22 (m, 20H), 7.18 (d, $J = 8.8$ Hz, 2H), 7.01 (d, $J = 8.8$ Hz, 2H), 6.91 (d, $J = 8.8$ Hz, 2H), 6.69 (d, $J = 8.4$ Hz, 2H), 6.49-6.36 (br s, 2H), 5.51 (d, $J = 8.0$ Hz, 1H), 5.43 (d, $J = 6.8$ Hz, 1H), 5.13, 5.10 (ABq, $J_{AB} \sim 12.1$ Hz, 2H), 5.12 (s, 2H), 5.11-5.09 (m, 1H), 5.05 (s, 2H), 4.82 (t, $J = 5.3$ Hz, 1H), 4.43-4.37 (m, 2H), 3.54-3.47 (m, 2H), 3.03-3.00 (m, 2H), 2.94 (s, 2H), 2.47 (s, 3H), 2.42 (s, 3H), 2.00 (s, 3H), 1.63-1.57 (m, 1H), 1.51-1.39 (m, 3H), 1.39 (s, 6H), 1.36 (s, 9H). $^{13}\text{C-NMR}$ (101 MHz, DMSO- d_6): δ 170.6, 170.4, 170.4, 169.9, 169.7, 158.3, 157.7, 157.4, 156.8, 156.0, 137.3, 137.1, 137.0, 135.8, 131.4, 131.1, 129.2, 129.0, 128.4, 128.42, 128.37, 128.3, 128.1, 128.0, 128.0, 127.84, 127.81, 127.7, 127.6, 127.5, 124.3, 114.99, 114.88, 114.4, 86.3, 78.4, 69.2, 66.1, 61.69, 61.65, 55.8, 54.9, 45.89, 45.85, 42.5, 28.3, 28.2, 26.0, 25.9, 19.0, 17.6, 12.3. **HRMS** (FAB) calculated for $\text{C}_{72}\text{H}_{82}\text{N}_8\text{O}_{15}\text{S}$ 1331.56986; Found 1331.57123 $[\text{M}+\text{H}]$.

***N*-tert-Butyloxycarbonyl-L-[*p*-(hydroxy)phenyl]glycine-L-arginine(Pbf)-D-[*p*-(benzyloxy)phenyl]glycine-L-serine-D-[*p*-(benzyloxy)phenyl]glycine benzyl ester (16b)**

The title compound was prepared and purified analogously to compound **16a** by replacing **10a** with **10b** (1.17 g, 1.51 mmol). The product was obtained as a white foam (722 mg, 36%). $[\alpha]_D^{23} = 7.3$ ($c = 1.0$, MeOH). $^1\text{H-NMR}$ (400 MHz; DMSO- d_6): δ 9.39 (s, 1H), 8.79 (d, $J = 7.4$ Hz, 1H), 8.45 (d, $J = 7.6$ Hz, 1H), 8.39 (d, $J = 7.7$ Hz, 1H), 8.18 (d, $J = 7.8$ Hz, 1H), 7.45-7.18 (m, 20 H), 7.19 (d, $J = 8.7$ Hz, 2H), 7.00 (d, $J = 8.8$ Hz, 2H), 6.92 (d, $J = 8.8$

Hz, 2H), 6.70 (d, $J = 8.6$ Hz, 2H), 6.40 (br s, 2H), 5.54 (d, $J = 7.7$ Hz, 1H), 5.46 (d, $J = 7.2$ Hz, 1H), 5.17-5.06 (m, 7H), 4.85 (t, $J = 6.6$ Hz, 1H), 4.52-4.02 (m, 2H), 3.46-3.38 (m, 2H), 3.04-2.99 (m, 2H), 2.94 (s, 2H), 2.49 (s, 3H), 2.43 (s, 3H), 2.00 (s, 3H), 1.62-1.60 (m, 1H), 1.50-1.41 (m, 3H), 1.40 (s, 6H), 1.37 (s, 9H). $^{13}\text{C-NMR}$ (101 MHz, DMSO- d_6): δ 170.62, 170.55, 170.5, 170.4, 169.8, 169.7, 158.2, 157.8, 157.7, 157.4, 156.8, 156.0, 137.3, 137.1, 137.0, 135.7, 131.4, 128.94, 128.91, 128.5, 128.43, 128.36, 128.2, 127.99, 127.98, 127.9, 127.8, 127.68, 127.65, 127.6, 127.5, 124.3, 116.3, 115.0, 114.9, 114.9, 114.8, 114.5, 114.4, 86.3, 69.21, 69.19, 66.2, 61.8, 42.5, 30.7, 28.3, 28.2, 19.0, 17.6, 12.3. **HRMS** (FAB) calculated for $\text{C}_{72}\text{H}_{82}\text{N}_8\text{O}_{15}\text{S}$ 1353.55181; Found 1353.5527 $[\text{M}+\text{Na}]^+$.

L-[*p*-(hydroxy)phenyl]glycine-L-arginine-D-[*p*-(hydroxy)phenyl]glycine-L-serine-L-[*p*-(hydroxy)phenyl]glycyl-pantetheine (17a/17b)

To a 250 mL pressure flask, protected peptide **16a** or **16b** (213 mg, 0.16 mmol) was dissolved in 10 mL of reagent grade THF and to the solution was added a catalytic amount of Pd-OH/C and the flask was vigorously shaken under 50 psi of H_2 for 12 h. The contents of the flask were filtered through Celite, washed with 100 mL of THF and concentrated *in vacuo* to a white foam, which was used without further purification.

To a 25 mL round-bottomed flask, equipped with a magnetic stir bar, the freshly deprotected pentapeptide was dissolved in 5 mL of reagent grade DMF. To this solution was added DIEA (84 μL , 0.48 mmol) and PyBOP (100 mg, 0.19 mmol) followed by **11** (61 mg, 0.19 mmol). The reaction was stirred at room temperature for 1 h. The solution was diluted with 50 mL of EtOAc, washed with sat. aq. NH_4Cl (2×15 mL), sat. aq. NaHCO_3 (1×15 mL) and concentrated *in vacuo*. The residue was re-dissolved in 2.0 mL of 1:1 ACN: H_2O solution and purified according to Prep Method B as a mixture of diastereomers. The product was collected, frozen on dry ice and lyophilized to dryness. The lyophilized powder was dissolved in TFA for 10 min, concentrated *in vacuo*, redissolved in 2 mL of 80:20 H_2O : ACN supplemented with 0.1% TFA and purified using Prep Method B. Product **17a/17b** product was collected, frozen on dry ice, lyophilized to dryness and obtained as the white TFA salt (60.8 mg, 35%). The product was further purified using Analytical Method A and verified to be an inseparable mixture of diastereomers. $^1\text{H-NMR}$ (**17a**) (400 MHz; D_2O): δ 7.24 (d, $J = 8.8$ Hz, 2H), 7.21 (d, $J = 8.6$ Hz, 2H), 7.11 (d, $J = 8.8$ Hz, 2H), 6.85 (d, $J = 8.4$ Hz, 2H), 6.81 (d, $J = 8.8$ Hz, 2H), 6.76 (d, $J = 8.4$ Hz, 2H), 5.50 (s, 1H), 5.29 (s, 1H), 5.05 (s, 1H), 4.44 (t, $J = 5.5$ Hz, 1H), 4.32-4.29 (m, 1H), 3.91 (s, 1H), 3.82-3.80 (m, 2H), 3.44 (d, $J = 11.2$ Hz, 1H), 3.34-3.27 (m, 4H), 3.33 (d, $J = 11.2$ Hz), 3.06-2.99 (m, 4H), 2.26-2.22 (m, 2H), 1.70-1.64 (m, 2H), 1.49-1.40 (m, 2H), 0.85 (s, 3H), 0.81 (s, 3H). $^1\text{H-NMR}$ (**17b**) (400 MHz; D_2O): δ 7.30 (d, $J = 8.4$ Hz, 2H), 7.26 (d, $J = 8.8$ Hz, 2H), 7.16 (d, $J = 8.7$ Hz, 2H), 6.90 (d, $J = 8.6$ Hz, 2H), 6.81 (d, $J = 8.7$ Hz, 2H), 6.76 (d, $J = 8.6$ Hz, 2H), 5.45 (s, 1H), 5.28 (s, 1H), 5.03 (s, 1H), 4.44 (t, $J = 5.5$ Hz, 1H), 4.32-4.29 (m, 1H), 3.91 (s, 1H), 3.79-3.78 (m, 2H), 3.44 (d, $J = 11.2$ Hz, 1H), 3.34-3.27 (m, 4H), 3.33 (d, $J = 11.2$ Hz), 3.06-2.99 (m, 4H), 2.24 ($J = 6.0$, 2H), 1.70-1.64 (m, 2H), 1.49-1.40 (m, 2H), 0.85 (s, 3H), 0.81 (s, 3H). $^{13}\text{C-NMR}$ (**17a/17b**) (101 MHz, D_2O): δ 201.0, 175.0, 173.9, 172.6, 172.1, 171.4, 168.9, 168.8, 163.5, 163.1, 162.8, 162.4, 157.3, 156.6, 156.4, 156.3, 156.1, 129.7, 129.7, 129.6, 129.6, 129.3, 129.2, 129.2, 127.1, 126.4, 123.2, 123.2, 117.8, 116.3, 115.98, 115.95, 114.9, 75.8, 68.4, 63.6, 63.5, 63.4, 60.8, 57.5, 57.2, 55.9, 55.6, 54.0, 40.5, 40.4, 38.6, 38.4, 35.3, 35.2, 28.1, 27.7, 24.3, 20.5, 19.1. **HRMS** (FAB) calculated for $\text{C}_{44}\text{H}_{60}\text{N}_{10}\text{O}_{13}\text{S}$ 969.41403; Found 969.41241 $[\text{M}+\text{H}]^+$.

***N*-tert-Butyloxycarbonyl-D-[*p*-(benzyloxy)phenyl]glycine-L-tert-butylphosphoserine-L-benzyl-[*p*-(benzyloxy)phenyl]glycine benzyl ester (18a)**

To a 100 mL flame-dried round-bottomed flask, equipped with a magnetic stir bar and an argon inlet, protected tripeptide **10a** (2.10 g, 2.71 mmol) was dissolved in 15 mL of freshly

distilled THF. To this solution was added tetrazole (7.22 mL, 0.45 M in ACN, 3.25 mmol) followed by di-*tert*-butyl *N,N*-diisopropylphosphoramidite (1.03 mL, 3.25 mmol). The reaction mixture was allowed to stir at room temperature for 12 h. The solution was cooled to 0 °C in an ice-bath, *tert*-butyl hydroperoxide (590 μ L, 5.5 M in decane, 3.25 mmol) was added and the reaction was stirred at 0 °C for 3 h. The solution was diluted with 150 mL of EtOAc and washed with 1: 1 sat. aq. NaHCO₃: Na₂S₂O₃ (2 \times 50 mL). The EtOAc was concentrated *in vacuo* to a viscous yellow oil, which was purified by flash chromatography on silica gel that was pre-treated for 12 h with 1:1 solution of EtOAc: Hex containing 5% triethylamine. The product was eluted with a step gradient mobile phase of 70: 30 Hex: EtOAc to 50: 50 Hex: EtOAc to elute the partially purified product as a colorless oil containing phosphoramidite impurities. Crystallization of the oil in Et₂O and Hex provided the desired product as a white granular solid (1.67 g, 64%). mp 84 °C; $[\alpha]_D^{24} = -3.2$ (c = 1.0, EtOAc). **¹H-NMR** (400 MHz; CDCl₃): δ 7.76 (br s, 1H), 7.68 (br s, 1H), 7.43-7.21 (m, 20H), 6.94 (d, *J* = 8.8, 2H), 6.93 (d, *J* = 8.8, 2H), 5.63 (d, *J* = 6.0 Hz, 1H), 5.57 (d, *J* = 6.8 Hz, 1H), 5.16 (s, 1H), 5.15 (s, 1H), 5.06 (s, 2H), 5.5 (s, 2H), 4.69-4.66 (m, 1H), 4.42 (br t, *J* = 8.8 Hz, 1H), 3.96 (td, *J* = 10.1, 3.7 Hz, 1H), 1.41 (s, 9H), 1.40 (s, 9H), 1.37 (s, 9H). **¹³C-NMR** (101 MHz, CDCl₃): δ 171.3, 171.3, 170.2, 168.3, 159.0, 136.9, 135.5, 129.0, 128.7, 128.60, 128.56, 128.3, 128.2, 128.0, 128.0, 127.6, 127.6, 115.4, 115.2, 100.1, 83.8, 83.7, 83.5, 83.4, 70.1, 67.3, 65.8, 56.4, 53.7, 53.6. **³¹P-NMR** (162 MHz, CDCl₃): δ -8.92. **HRMS** (FAB) calculated for C₅₃H₆₄N₃O₁₂P 966.43059; Found 966.42975 [M+H]⁺.

***N-tert*-Butyloxycarbonyl-*D*-[*p*-(benzyloxy)phenyl]glycine-*L*-*tert*-butylphosphoserine-*D*-[*p*-(benzyloxy)phenyl]glycine benzyl ester (18b)**

The title compound was prepared and purified analogously to compound **18a** by replacing **10a** with **10b** (1.41 g, 1.82 mmol). The product was obtained as a white foam (1.09 g, 62%). mp 83 °C; $[\alpha]_D^{24} = -49.7$ (c = 1.0, EtOAc). **¹H-NMR** (400 MHz; CDCl₃): δ 7.81 (br s, 2H), 7.44-7.22 (m, 20H), 6.94 (d, *J* = 8.4 Hz, 2H), 6.92 (d, *J* = 8.4 Hz, 2H), 5.55 (d, *J* = 7.1 Hz, 1H), 5.53 (br s, 1H), 5.19, 5.14 (ABq, *J*_{AB} = 12.4 Hz, 2H) 5.05 (2 \times s, 4H), 4.70-4.66 (m, 1H), 4.43 (br t, *J* = 10.2 Hz, 1H), 3.92 (br dt, *J* = 9.2, 4.5 Hz, 1H), 1.44 (s, 9H), 1.37 (s, 18H). **¹³C-NMR** (101 MHz, CDCl₃): δ 171.32, 171.31, 170.26, 168.3, 159.02, 158.96, 137.0, 136.9, 135.5, 128.8, 128.7, 128.6, 128.4, 128.2, 128.14, 128.12, 128.07, 127.6, 115.4, 115.2, 83.9, 83.8, 83.5, 70.13, 70.11, 67.3, 65.8, 56.5, 53.6, 53.6, 29.9, 29.8, 29.8, 28.4. **³¹P-NMR** (162 MHz, CDCl₃): δ -8.85. **HRMS** (FAB) calculated for C₅₃H₆₄N₃O₁₂P 966.43059; Found 966.43025 [M+H]⁺.

***D*-[*p*-(hydroxy)phenyl]glycine-*L*-phosphoserine-*L*-[*p*-(hydroxy)phenyl] glycy-pantetheine (19a/19b)**

To a 250 mL pressure flask, protected peptide **18a** or **18b** (77 mg, 0.10 mmol) was dissolved in 10 mL of reagent grade THF and to it was added a catalytic amount of Pd-OH/C and the flask was vigorously shaken under 50 psi of H₂ for 12 h on a Parr hydrogenation apparatus. The mixture was filtered through Celite, washed with 100 mL of THF, concentrated *in vacuo* to a white foam and used without further purification.

To a 10 mL round-bottomed flask equipped with a magnetic stir bar, freshly hydrogenolyzed tripeptide corresponding to compounds **18a** or **18b** (50.35 mg, 0.10 mmol) was dissolved in 2 mL of reagent grade DMF and to this solution was added K₂CO₃ (42 mg, 0.30 mmol) and cooled to 0 °C with an ice-bath. To this cooled solution was added PyBOP (63 mg, 0.12 mmol) and **11** (39 mg, 0.12 mmol) and the reaction mixture was stirred for 30 min at room temperature. The solution was diluted with 50 mL of EtOAc and washed with sat. aq. NH₄Cl (2 \times 20 mL), sat. aq. NaHCO₃ (1 \times 20 mL) and brine (1 \times 20 mL). The EtOAc extract was concentrated *in vacuo* to a viscous oil, which was re-dissolved in 2 mL 70: 30 ACN: H₂O. The product was purified by Prep Method B, collected on dry ice and

lyophilized to dryness. The freshly lyophilized product was dissolved in 5 mL of reagent grade TFA and stirred at room temperature for 15 min. The TFA was removed *in vacuo* and the residue was re-suspended in 2 mL of 70:30 H₂O: ACN supplemented with 0.1% TFA. The reaction mixture was purified by Prep Method A, collected, frozen on dry ice and lyophilized to dryness as a white TFA salt (23.0 mg, 25%). The product was further purified using Analytical Method A and verified to be an inseparable mixture of diastereomers. **¹H-NMR (19a)** (400 MHz; D₂O): δ 7.31 (d, *J* = 8.7 Hz, 2H), 7.23 (d, *J* = 8.6 Hz, 2H), 6.89 (d, *J* = 8.8 Hz, 2H), 6.84 (d, *J* = 8.7 Hz, 2H), 5.45 (s, 1H), 5.08 (s, 1H), 4.57 (t, *J* = 5.4 Hz, 1H), 3.97-3.89 (m, 2H), 3.41 (d, *J* = 11.3 Hz, 1H), 3.30-3.25 (m, 5H), 3.05-2.98 (m, 2H), 2.18 (app td, *J* = 6.6, 2.6 Hz, 2H), 0.81 (s, 3H), 0.77 (s, 3H). **¹H-NMR (19b)** (400 MHz; D₂O): δ 7.31 (d, *J* = 8.7 Hz, 2H), 7.25 (d, *J* = 8.5 Hz, 2H), 6.86 (d, *J* = 8.7 Hz, 2H), 6.82 (d, *J* = 8.9 Hz, 2H), 5.46 (s, 1H), 5.06 (s, 1H), 4.51 (t, *J* = 5.2 Hz, 1H), 4.05 (t, *J* = 6.1 Hz, 1H), 3.97-3.89 (m, 1H), 3.40 (d, *J* = 11.3 Hz, 1H), 3.30-3.25 (m, 5H), 3.05-2.98 (m, 2H), 2.18 (app td, *J* = 6.6, 2.6 Hz, 2H), 0.81 (s, 3H), 0.77 (s, 3H). **¹³C-NMR (19a/19b)** (101 MHz, D₂O): δ 201.4, 200.9, 175.0, 173.9, 170.6, 168.9, 163.1, 162.8, 157.2, 156.4, 130.0, 129.8, 129.7, 126.23, 126.18, 123.4, 123.3, 116.4, 116.0, 75.7, 68.4, 63.9, 63.7, 56.1, 56.0, 54.2, 38.6, 38.4, 35.3, 35.1, 28.1, 20.5, 19.1. **³¹P-NMR (19a)** (162 MHz; D₂O): δ -0.04. **³¹P-NMR (19b)** (162 MHz; D₂O): δ -0.074. **HRMS (FAB)** calculated for C₃₀H₄₂N₅O₁₃ PS 744.23157 Found 744.23037 [M+H]⁺.

***N*-tert-Butyloxycarbonyl-L-acetylserine-L-[*p*-(benzyloxy)phenyl]glycine benzyl ester (20a)**

To a flame dried 250 mL round-bottomed flask equipped with a magnetic stir bar and an argon inlet, protected tripeptide **10a** (4.00 g, 5.17 mmol) was dissolved in 40 mL of reagent grade pyridine and to this was added acetic anhydride (537 μL, 5.69 mmol) and the reaction was stirred at room temperature for 12 h. The reaction mixture was concentrated *in vacuo* to a yellow solid, which was purified by silica gel flash chromatography utilizing an isocratic mobile phase 70: 30 Hex: EtOAc to afford the product as a white solid (4.18 g, 99%). [α]_D²³ = -4.4 (c = 1.0, EtOAc). **¹H-NMR** (400 MHz; DMSO-*d*₆): δ 8.88 (d, *J* = 6.3 Hz, 1 H), 8.48 (d, *J* = 8.0 Hz, 1 H), 7.45-7.21 (m, 20H), 7.02 (d, *J* = 8.6 Hz, 2H), 6.94 (d, *J* = 8.6 Hz, 2H), 5.41 (d, *J* = 6.4 Hz, 1 H), 5.21 (d, *J* = 7.7 Hz, 1 H), 5.16-5.08 (2 × s + ABq, 6H), 4.70 (br q, *J* = 7.0 Hz, 1 H), 4.09-4.04 (m, 2H), 1.78 (s, 3H), 1.36 (s, 9H). **¹³C-NMR** (101 MHz, DMSO-*d*₆): δ 170.6, 170.2, 169.9, 168.5, 158.4, 157.7, 154.8, 137.1, 137.0, 135.7, 130.9, 129.2, 128.5, 128.4, 128.4, 128.4, 128.0, 127.9, 127.8, 127.62, 127.59, 127.5, 114.9, 114.4, 78.4, 69.2, 69.1, 66.2, 63.2, 56.9, 56.0, 51.1, 28.2, 20.3. **HRMS (FAB)** calculated for C₄₇H₄₉N₃O₁₀ 816.34620; Found 816.34819 [M+H]⁺.

***N*-tert-Butyloxycarbonyl-L-acetylserine-D-benzyl-[*p*-(benzyloxy)phenyl]glycine (20b)**

The title compound was prepared and purified analogously to compound **20a** by replacing **10a** with **10b** (4.00 g, 5.17 mmol). The product was obtained as a white solid (4.18 g, 99%). [α]_D²³ = -51.3 (c = 1.0, EtOAc). **¹H-NMR** (400 MHz; DMSO-*d*₆): δ 8.93 (d, *J* = 6.6 Hz, 1 H), 8.47 (d, *J* = 8.3 Hz, 1 H), 7.46-7.23 (m, 20H), 7.01 (d, *J* = 8.8 Hz, 2H), 6.93 (d, *J* = 8.8 Hz, 2H), 5.44 (d, *J* = 7.1 Hz, 1 H), 5.24 (d, *J* = 7.9 Hz, 1 H), 5.16, 5.13 (ABq, *J*_{AB} = 12.7 Hz, 2H), 5.11 (s, 2H), 5.08 (s, 2H), 4.72 (br q, *J* = 6.3 Hz, 1 H), 4.073.96 (sym m, 2H), 1.73 (s, 3H), 1.36 (s, 9H). **¹³C-NMR** (101 MHz, DMSO-*d*₆): δ 171.1, 170.7, 170.3, 168.9, 158.8, 158.2, 137.6, 137.4, 136.2, 131.3, 129.4, 128.91, 128.89, 128.8, 128.5, 128.3, 128.3, 128.1, 128.1, 128.0, 115.4, 114.9, 69.7, 69.6, 66.7, 56.3, 51.7, 28.6, 20.7. **HRMS (FAB)** calculated for C₄₇H₄₉N₃O₁₀ 816.34620; Found 816.34773 [M+H]⁺.

D-[*p*-(hydroxy)phenyl]glycine-L-acetylserine-L-[*p*-(hydroxy)phenyl]glycylpantetheine (21a)

To a 250 mL pressure flask, protected peptide **20a** (147 mg, 0.18 mmol) was dissolved in 10 mL of reagent grade THF and to it was added a catalytic amount of Pd-OH/C and the

mixture was vigorously shaken under 50 psi of H₂ for 12 h on a Parr hydrogenator. The contents of the flask were filtered through Celite, washed with 100 mL of THF and concentrated *in vacuo* to a white foam and used without further purification.

To a 10 mL round-bottomed equipped with a magnetic stir bar, **20a** (100 mg, 0.18 mmol) was dissolved in 2 mL of reagent grade DMF and to this solution was added K₂CO₃ (76 mg, 0.55 mmol) and cooled to 0 °C in an ice-bath. To this cooled solution was added PyBOP (114 mg, 0.20 mmol) followed by **11** (70 mg, 0.20 mmol) and the reaction was then stirred for 30 min at room temperature. The solution was diluted with 50 mL of EtOAc and washed with sat. aq. NH₄Cl (2 × 20 mL), sat. aq. NaHCO₃ (1 × 20 mL) and brine (1 × 20 mL). The EtOAc was concentrated *in vacuo* to a viscous oil, which was re-dissolved in 2 mL 70: 30 ACN: H₂O. The reaction was purified by Prep Method A, collected, and frozen on dry ice and lyophilized to dryness. The product was dissolved in 5 mL of reagent grade TFA and stirred at room temperature for 15 min. The TFA was removed *in vacuo* and the residue was re-suspended in 2 mL of 70: 30 H₂O: ACN supplemented with 0.1% TFA. The freshly deprotected product purified by Prep Method A, collected, frozen on dry ice and lyophilized to dryness to afford the product as a white TFA salt (63.0 mg, 38%). Isolation of 2 mg of diastereomerically pure material was achieved using Analytical Method A. **¹H-NMR** (400 MHz; D₂O): δ 7.25 (2 × d, *J* = 8.2 Hz, 4H), 6.86 (2 × d, *J* = 8.2 Hz, 4H), 5.47 (s, 1H), 5.04 (s, 1H), 4.26 (d, *J* = 5.1 Hz, 2H), 3.87 (s, 1H), 3.40 (d, *J* = 11.3 Hz, 1H), 3.29-3.24 (m, 5H), 3.00 (br t, *J* ~ 6.1 Hz, 2H), 2.19 (br t, *J* ~ 6.4 Hz, 2H), 1.82 (s, 3H), 0.80 (s, 3H), 0.77 (s, 3H). **¹³C-NMR** (101 MHz, D₂O): δ 200.9, 188.6, 175.0, 173.8, 173.3, 169.9, 168.9, 166.9, 157.2, 156.4, 155.4, 129.7, 126.1, 123.5, 117.8, 116.3, 116.0, 83.9, 75.7, 68.4, 63.6, 63.0, 55.9, 52.4, 38.6, 38.3, 35.3, 35.1, 28.1, 20.5, 19.9, 19.1. **HRMS** (FAB) calculated for C₃₂H₄₃N₅O₁₁S 706.27580; Found 706.27413 [M+H]⁺.

***D*-[*p*-(hydroxy)phenyl]glycine-*L*-acetylserine-*D*-[*p*-(hydroxy)phenyl]glycyl- pantetheine (**21b**)**

The title compound was prepared and purified analogously to compound **21a** by replacing **20a** with **20b** (146.9 mg, 0.18 mmol). The product was obtained as a white TFA salt (64.7 mg, 39%). Isolation of 2 mg of diastereomerically pure material was achieved using Analytical Method A. **¹H-NMR** (400 MHz; D₂O): δ 7.28 (d, *J* = 8.7 Hz, 2H), 7.22 (d, *J* = 8.7 Hz, 2H), 6.89 (d, *J* = 8.8 Hz, 2H), 6.84 (d, *J* = 8.8 Hz, 2H), 5.47 (s, 1H), 5.06 (s, 1H), 4.75 (X of ABX, *J* = 6.4, 4.8 Hz, 1H), 4.14 (AB of ABX, *J* = 11.6, 6.4, 4.8 Hz, 2H), 3.87 (s, 1H), 3.40 (d, *J* = 11.3 Hz, 1H), 3.31-3.26 (m, 4H), 3.29 (d, *J* = 11.3 Hz, 1H), 3.08-2.97 (m, 2H), 2.20 (td, *J* = 6.6, 2.1 Hz, 2H), 1.69 (s, 3H), 0.81 (s, 3H), 0.77 (s, 3H). **¹³C-NMR** (101 MHz, D₂O): δ 201.0, 175.0, 173.9, 173.2, 169.9, 169.0, 157.3, 156.4, 129.8, 129.7, 126.5, 123.5, 116.3, 116.0, 75.7, 68.4, 63.6, 62.9, 56.0, 52.3, 38.6, 38.3, 35.3, 35.1, 20.4, 19.7, 19.1. **HRMS** (FAB) calculated for C₃₂H₄₃N₅O₁₁S 706.27580; Found 706.27532 [M+H]⁺.

***L*-[*p*-(Benzyloxy)phenyl]glycine *tert*-butyl ester Toluenesulfonate (**22a**)**

To a 500 mL pressure bottle equipped with a magnetic stir bar, *L*-[*p*-(benzyloxy)phenyl]glycine¹⁴ (10.00 g, 49.4 mmol) was suspended in 100 mL of reagent-grade dioxane containing 10 mL of concentrated sulfuric acid and cooled to 0 °C in an ice-bath. In a separate 125 mL Erlenmeyer flask, isobutylene (100 mL of liquid) was condensed from gas at -78 °C, and the liquid was quickly added to the pressure bottle and sealed. The contents of the pressure bottle were stirred at room temperature for 12 h. The solution was cooled to 0 °C with an ice-bath and the solution was quickly poured into an ice-cold mixture of 400 mL of 1.0 M NaOH and 500 mL Et₂O. The mixture was transferred to a 1 L separatory flask, the organics were partitioned and set aside and the aqueous layer was washed with Et₂O (2 × 100 mL). The organic fractions were combined, dried with brine (2 × 100 mL) and concentrated *in vacuo* to approximately 150 mL. This ethereal solution was added to a separate flask containing *p*-toluene sulfonic acid monohydrate (9.40 g, 49.4

mmol) in 200 mL Et₂O, which precipitated the product. The precipitate was filtered and dried under high vacuum to afford the product as a white salt (15.35 g, 64%). $[\alpha]_D^{25} = 44.4$ (c = 1.0, MeOH); **¹H-NMR** (400 MHz; DMSO-d₆) δ 8.68 (br s, 3H), 7.50 (d, *J* = 8.0 Hz, 2H), 7.45-7.34 (m, 7H), 7.13 (d, *J* = 7.0 Hz, 2H), 7.11 (d, *J* = 8.7 Hz, 2H), 5.15 (s, 2H), 5.07 (br q., *J* = 5.4 Hz, 1H), 2.30 (s, 3H), 1.38 (s, 9H). **¹³C-NMR** (101 MHz, DMSO-d₆): δ 168.2, 159.5, 146.0, 138.2, 137.2, 130.0, 128.9, 128.6, 128.4, 128.2, 128.1, 126.0, 125.5, 115.7, 100.0, 83.6, 69.7, 55.8, 27.9, 21.3. **HRMS** (FAB) calculated for C₁₉H₂₄NO₃ 314.17562; Found 314.17537 [M+H]⁺.

***D*-[*p*-(Benzyloxy)phenyl]glycine *tert*-butyl ester Toluenesulfonate (22b)**

The title compound was prepared and purified analogously to compound **22a** by replacing *L*-[*p*-(benzyloxy)phenyl]glycine with *D*-[*p*-(benzyloxy)phenyl]glycine¹⁴ (10.0 g, 49.4 mmol). The product was obtained as a white salt (15.59 g, 65%). $[\alpha]_D^{25} = -45.7$ (c = 1.0, MeOH); **¹H-NMR** (400 MHz; DMSO-d₆): δ 8.68 (br s, 3H), 7.50 (d, *J* = 8.0 Hz, 2H), 7.45-7.34 (m, 7H), 7.13 (d, *J* = 7.0 Hz, 2H), 7.11 (d, *J* = 8.7 Hz, 2H), 5.15 (s, 2H), 5.07 (br q., *J* = 5.4 Hz, 1H), 2.30 (s, 3H), 1.38 (s, 9H). **¹³C-NMR** (101 MHz, DMSO-d₆): δ 168.2, 159.5, 146.0, 138.2, 137.2, 130.0, 128.9, 128.6, 128.4, 128.2, 128.1, 126.0, 125.5, 115.7, 100.0, 83.6, 69.7, 55.8, 27.9, 21.3. **HRMS** (FAB) calculated for C₁₉H₂₄NO₃ 314.17562; Found 314.17550 [M+H]⁺.

***N*-(4,6-Diphenyl-4-oxazolin-2-onyl)-*L*-seryl-*L*-[*p*-(benzyloxy)phenyl]glycine *tert*-butyl ester (23a)**

To a flame dried 250 mL round-bottomed flask equipped with a magnetic stir bar, *L*-Ox-serine dicyclohexylammonium salt²⁶ (7.50 g, 14.80 mmol) and DIEA (2.57 mL, 14.80 mmol) were dissolved in 25 mL of reagent grade DMF and cooled to 0 °C in an ice bath. In a separate round-bottomed flask, **22a** (8.62 g, 17.76 mmol) was dissolved in 10 mL of reagent grade DMF and to it was added DIEA (2.57 mL, 14.80 mmol) and cooled to 0 °C. Once both solutions were sufficiently cooled, PyBOP (9.24 g, 17.76 mmol) was added to the flask containing *L*-Ox-serine and after 1 min the flask containing **22a** was transferred drop wise over 2 min to the activated acid. The reaction was stirred for 3 h from 0 °C to room temperature. The solution was diluted with 200 mL of EtOAc and washed with sat. aq. NH₄Cl (2 × 75 mL), sat. aq. NaHCO₃ (2 × 75 mL) and brine (1 × 75 mL). The EtOAc was concentrated *in vacuo* to a viscous yellow oil and the product was purified as a white foam by silica gel chromatography with 60: 40 Hex: EtOAc to afford the product as a white solid (6.52 g, 71%). $[\alpha]_D^{25} = 39.8$ (c = 1.0, EtOAc); **¹H-NMR** (400 MHz; DMSO-d₆): δ 8.73 (d, *J* = 6.8 Hz, 1H), 7.57-7.22 (m, 16H), 7.12 (d, *J* = 7.0 Hz, 2H), 7.03 (d, *J* = 8.8 Hz, 2H), 5.28 (br s, 1H), 5.20 (d, *J* = 6.8 Hz, 1H), 5.12 (s, 2H), 4.21 (dd, *J* = 9.0, 5.8 Hz, 1H), 4.06-3.99 (m, 1H), 3.91 (dt, *J* = 11.2, 5.7 Hz, 1H), 1.35 (s, 9H). **¹³C-NMR** (101 MHz, DMSO-d₆): δ 169.7, 166.7, 158.6, 153.8, 137.5, 133.5, 131.3, 130.8, 129.9, 129.4, 129.2, 128.9, 128.9, 128.3, 128.14, 128.08, 127.1, 125.2, 124.1, 115.3, 81.7, 69.7, 59.4, 58.5, 57.1, 28.0. **HRMS** (FAB) calculated for C₃₇H₃₆N₂O₇ 620.25225; Found 620.25150 [M+H]⁺.

***N*-(4,6-Diphenyl-4-oxazolin-2-onyl)-*L*-seryl-*D*-[*p*-(benzyloxy)phenyl]glycine *tert*-butyl ester (23b)**

The title compound was prepared and purified analogously to compound **23a** by replacing **22a** with **22b** (8.62 g, 17.76 mmol). The product was obtained as a white foam (6.34 g, 69%). $[\alpha]_D^{23} = -50.5$ (c = 1.0, EtOAc). **¹H-NMR** (400 MHz; DMSO-d₆): δ 8.68 (d, *J* = 7.2 Hz, 1H), 7.59-7.23 (m, 15H), 7.15 (d, *J* = 7.0 Hz, 2H), 7.03 (d, *J* = 8.8 Hz, 2H), 5.43 (t, *J* = 5.6 Hz, 1H), 5.22 (d, *J* = 7.2 Hz, 1H), 5.12 (s, 2H), 4.23 (dd, *J* = 8.3, 6.3 Hz, 1H), 4.05-3.99 (m, 1H), 3.86 (dt, *J* = 11.3, 5.8 Hz, 1H), 1.34 (s, 9H). **¹³C-NMR** (101 MHz, DMSO-d₆): δ 169.8, 167.1, 158.6, 153.8, 137.5, 133.5, 131.3, 130.8, 130.0, 129.2, 129.2, 128.9, 128.9,

128.3, 128.2, 128.1, 128.1, 127.0, 125.2, 124.2, 115.3, 81.7, 69.7, 59.3, 58.6, 57.1, 28.0.
HRMS (FAB) calculated for $C_{37}H_{36}N_2O_7$ 620.25225; Found 620.25214 $[M+H]^+$.

3-*N*-(4,5-Diphenyl-4-oxazolin-2-onyl)*epi*-aminonocardicin *tert*-butyl ester (24a)

To a flame dried 100 mL round-bottomed flask equipped with a magnetic stir bar, **23a** (3.28 g, 5.28 mmol) was dissolved in 30 mL of freshly distilled THF and the flask was wrapped with aluminum foil to exclude light. To this solution was added $P(OEt)_3$ (1.09 mL, 6.34 mmol) and DEAD (994 μ L, 6.34 mmol) and the reaction was stirred at room temperature for 12 h. The THF was removed *in vacuo* and the residue was purified by flash chromatography with an isocratic mobile phase of 60: 40, EtOAc: Hex to afford the product as a white foam (2.99 g, 94%). $[\alpha]_D^{22} = -99.6$ ($c = 1.0$, EtOAc). **1H -NMR** (400 MHz; DMSO- d_6): δ 7.58-7.17 (m, 17H), 7.02 (d, $J = 8.7$ Hz, 2H), 5.27 (s, 1H), 5.09 (s, 2H), 4.82 (dd, $J = 5.5$, 2.7 Hz, 1H), 3.97 (dd, $J = 5.6$, 2.7 Hz, 1H), 3.50 (t, $J = 5.7$ Hz, 1H), 1.45 (s, 9H). **^{13}C -NMR** (101 MHz, DMSO- d_6): δ 167.2, 163.1, 158.3, 152.0, 136.9, 133.6, 130.7, 130.4, 129.6, 128.8, 128.7, 128.4, 128.0, 127.8, 127.7, 127.2, 126.2, 125.5, 124.0, 123.4, 114.9, 82.2, 69.2, 57.7, 56.6, 45.1, 27.5. **HRMS** (FAB) calculated for $C_{37}H_{34}N_2O_6$ 602.24169; Found 602.24039 $[M+H]^+$.

3-*N*-(4,5-Diphenyl-4-oxazolin onyl)aminonocardicin *tert*-butyl ester (24b)

The title compound was prepared and purified analogously to compound **24a** by replacing **23a** with **23b** (3.28 g, 5.28 mmol). The product was obtained as a white solid (3.05 g, 96%). $[\alpha]_D^{23} = -116.3$ ($c = 1.0$, EtOAc). **1H -NMR** (400 MHz; DMSO- d_6): δ 7.59-7.14 (m, 17H), 7.05 (d, $J = 8.8$ Hz, 2H), 5.26 (s, 1H), 5.14 (s, 2H), 4.84 (dd, $J = 5.7$, 2.8 Hz, 1H), 3.69 (t, $J = 5.7$ Hz, 1H), 3.40 (dd, $J = 5.7$, 2.8 Hz, 1H), 1.38 (s, 9H). **^{13}C -NMR** (101 MHz, DMSO- d_6): δ 167.9, 163.3, 158.4, 152.1, 136.9, 133.7, 130.7, 130.6, 129.5, 129.3, 128.7, 128.4, 128.0, 127.9, 127.8, 127.1, 125.4, 125.2, 124.0, 123.2, 115.0, 82.2, 69.3, 57.6, 56.1, 44.8, 27.5. **HRMS** (FAB) calculated for $C_{37}H_{34}N_2O_6$ 602.24169; Found 602.24038 $[M+H]^+$.

epi-3-Aminonocardicin *tert*-butyl ester Hydrochloride (25a)

To a 250 mL pressure bottle, **24a** (3.00 g, 4.98 mmol) was dissolved in 15 mL of reagent grade THF and to this was added a catalytic amount of Pd-OH/C. Hydrogenolysis was carried out over 48 h under 50 psi of H_2 on a Parr apparatus with vigorous shaking. The mixture was filtered through Celite and the Pd-OH/C was washed with THF (3 \times 50 mL). The filtrate was concentrated *in vacuo* to a viscous oil, which was partitioned into 30 mL Et_2O , and 10 mL water containing conc. HCl (457 μ L, 5.48 mmol). The aqueous layer was washed with Et_2O (2 \times 30 mL), flash frozen and lyophilized to dryness to afford the product as the white HCl salt (1.46 g, 89%). $[\alpha]_D^{24} = 101.9$ ($c = 1.0$, MeOH). **1H -NMR** (400 MHz; DMSO- d_6): δ 9.76 (s, 1H), 9.04 (s, 3H), 7.14 (d, $J = 8.6$ Hz, 2H), 6.81 (d, $J = 8.6$ Hz, 2H), 5.30 (s, 1H), 4.48 (dd, $J = 5.4$, 2.4 Hz, 1H), 3.58 (dd, $J = 6.3$, 2.4 Hz, 1H), 3.43 (t, $J = 6.2$ Hz, 1H), 1.42 (s, 9H). **^{13}C -NMR** (101 MHz, DMSO- d_6): δ 167.7, 162.1, 157.8, 129.0, 123.8, 115.7, 82.4, 57.8, 53.3, 44.2, 27.6. **HRMS** (FAB) calculated for $C_{15}H_{21}ClN_2O_4$ 293.15013; Found 293.14937 $[M+H]^+$.

Aminonocardicin *tert*-butyl ester Hydrochloride (25b)

The title compound was prepared and purified analogously to compound **25a** by replacing **24a** with **24b** (3.00 g, 4.98 mmol). The product was obtained as a white HCl salt (1.51 g, 92%). $[\alpha]_D^{25} = -146.2$ ($c = 1.0$, MeOH). **1H -NMR** (400 MHz; DMSO- d_6): δ 9.76 (br s, 1H), 8.93 (br s, 2H), 7.16 (d, $J = 8.6$ Hz, 2H), 6.82 (d, $J = 8.6$ Hz, 2H), 5.33 (s, 1H), 4.56 (d, $J = 3.9$ Hz, 1H), 3.70 (t, $J = 5.8$ Hz, 1H), 3.06 (dd, $J = 6.1$, 2.1 Hz, 1H), 1.40 (s, 9H). **^{13}C -NMR** (101 MHz, DMSO- d_6): δ 168.1, 162.2, 157.9, 129.5, 123.0, 115.7, 82.3, 57.7, 53.0, 43.8, 27.5. **HRMS** (FAB) calculated for $C_{15}H_{21}ClN_2O_4$ 293.15013 Found 293.14955 $[M+H]^+$.

***N*-tert-Butyloxycarbonyl-D-[*p*-(hydroxy)phenyl]glycine (26)**

To a 500 mL Erlenmeyer flask equipped with a magnetic stir bar, D-[*p*-(hydroxy)phenyl]glycine (20.00 g, 119.57 mmol) was dissolved in 300 mL of 1.0 M NaOH and to this was added *di*-tert-butyl dicarbonate (31.31 g, 143.48 mmol) in 500 mL of reagent grade THF. The reaction was stirred at room temperature for 12 h. The THF was partitioned with 200 mL Et₂O and separated. The aqueous layer was cooled to 0 °C in an ice-bath and acidified to pH 2.0 with conc. HCl. The acidified aqueous mixture was extracted with EtOAc (3 × 100 mL) and the organic extractions were pooled, washed with brine (1 × 75 mL) and concentrated *in vacuo* to a viscous oil. The product was crystallized from EtOAc/Hex as a white solid (29.46 g, 97%). mp 198 °C; [α]_D²⁵ = -133.7 (c = 1.0, MeOH). ¹H-NMR (400 MHz; DMSO-d₆): δ 7.37 (d, *J* = 8.1 Hz, 1H), 7.19 (d, *J* = 8.6 Hz, 2H), 6.73 (d, *J* = 8.6 Hz, 2H), 4.98 (d, *J* = 8.1 Hz, 1H), 1.39 (s, 9H). ¹³C-NMR (101 MHz, DMSO-d₆): δ 172.9, 157.2, 155.3, 129.1, 127.7, 115.2, 78.4, 57.2, 28.3. HRMS (FAB) calculated for C₁₃H₁₇NO₅ 268.11850; Found 268.11831 [M+H]⁺.

Protected *epi*-Nocardicin G (27a)

To a flame-dried 100 mL round-bottomed flask equipped with a magnetic stir bar and an argon inlet, compound **26** (963 mg, 3.60 mmol) was dissolved in 10 mL of freshly distilled acetone. To this solution was added 2,6-lutidine (370 μL, 3.26 mmol) and a catalytic amount of *N*-methylmorpholine (79 μL, 0.72 mmol). The solution was cooled to -50 °C with the aid of a dry ice/acetone bath. Once the solution was sufficiently cold, isobutyl chloroformate (427 μL, 3.26 mmol), dissolved in 2 mL of freshly distilled acetone, was added drop wise to the solution containing **26** over 2 min. The solution was stirred at -50 to -30 °C for 30 min during which time a precipitate formed. The dry ice/acetone bath was removed and replaced with an ice-bath and the mixture was stirred at 0 °C for an additional 20 min.

To a separate 50 mL pear-shaped flask, **25a** (789 mg, 2.40 mmol) was dissolved in 5 mL of reagent grade DMF along with 2,6-lutidine (370 μL, 3.26 mmol) and cooled to 0 °C in an ice-bath. The solution was added drop wise over 2 min to the mixture containing the mixed anhydride. The reaction mixture was stirred at 0 °C for 30 minutes, warmed to room temperature by removal of the ice-bath and stirred for an additional 3 h. The solution was diluted with 150 mL of EtOAc and washed with sat. aq. NH₄Cl (2 × 40 mL), sat. aq. NaHCO₃ (1 × 40 mL) and brine (1 × 40 mL). The dried EtOAc extract was concentrated *in vacuo* to a viscous yellow oil, which was purified by silica gel flash chromatography using an isocratic mobile phase 60: 40 EtOAc: Hex to afford the product as a white foam (832 mg, 64%). [α]_D²² = 0.80 (c = 1.0, MeOH). ¹H-NMR (400 MHz; DMSO-d₆): δ 9.60 (s, 1H), 9.39 (s, 1H), 8.87 (d, *J* = 7.9 Hz, 1H), 7.17 (d, *J* = 8.6 Hz, 2H), 7.10 (d, *J* = 8.6 Hz, 2H), 6.76 (d, *J* = 8.6 Hz, 2H), 6.68 (d, *J* = 8.6 Hz, 2H), 5.25 (s, 1H), 5.08 (d, *J* = 8.6 Hz, 1H), 4.81 (ddd, *J* = 7.8, 5.2, 2.7 Hz, 1H), 3.30 (t, *J* = 5.3 Hz, 1H), 3.26 (dd, *J* = 4.1, 2.2), 1.39 (s, 9H), 1.37 (s, 9H). ¹³C-NMR (101 MHz, DMSO-d₆): δ 171.3, 168.6, 166.3, 157.9, 157.3, 155.3, 129.5, 129.1, 128.9, 124.6, 116.1, 115.4, 82.4, 78.8, 57.9, 55.4, 28.7, 28.0. HRMS (FAB) calculated for C₂₈H₃₅N₃O₈ 542.25024; Found 542.2496 [M+H]⁺.

Protected Nocardicin G (27b)

The title compound was prepared and purified analogously to compound **27a** by replacing **25a** with **25b** (789 mg, 2.40 mmol). The product was obtained as a white foam (871 mg, 67%). [α]_D²⁴ = -141.0 (c = 1.0, MeOH). ¹H-NMR (400 MHz; DMSO-d₆): δ 9.63 (s, 1H), 9.39 (s, 1H), 8.77 (d, *J* = 8.1 Hz, 1H), 7.13 (d, *J* = 8.4 Hz, 4H), 6.78 (d, *J* = 8.6 Hz, 3H), 6.67 (d, *J* = 8.6 Hz, 3H), 5.29 (s, 1H), 5.00 (d, *J* = 8.4 Hz, 1H), 4.88-4.85 (m, 1H), 3.67 (t, *J* = 5.3 Hz, 1H), 2.88-2.87 (m, 1H), 1.40 (s, 9H), 1.36 (s, 9H). ¹³C-NMR (101 MHz, DMSO-

d₆): δ 171.2, 168.8, 166.6, 158.0, 157.3, 155.3, 129.8, 129.1, 128.9, 124.3, 116.1, 115.4, 82.4, 78.8, 57.9, 55.1, 28.6, 28.0. **HRMS** (FAB) calculated for C₂₈H₃₅N₃O₈ 542.25024; Found 542.24950 [M+H]⁺.

***N*-tert-Butyloxycarbonyl-*epi*-Nocardicin G (28a)**

To a 100 mL round-bottomed flask, equipped with a magnetic stir bar, **27a** (470 mg, 0.88 mmol) was dissolved in 20 mL of reagent grade TFA and stirred at room temperature for 30 min. The TFA was evaporated under reduced pressure and residual TFA was removed by azeotropic distillation with toluene (2 × 50 mL) to provide an orange oil. To this oil was added 10 mL of reagent grade THF, 2 mL of water and DIEA (459 μ L, 2.63 mmol).

To a separate 50 mL round-bottomed flask, di-*tert*-butyl dicarbonate (227 mg, 1.4 mmol) was dissolved in 5 mL of THF and transferred drop wise over 2 min to the flask containing freshly deprotected **27a**. The reaction was stirred at room temperature for 12 h. The solution was diluted with 50 mL of EtOAc and washed with sat. aq. NH₄Cl (2 × 20 mL). The EtOAc was concentrated *in vacuo* to yield a yellow foam. The yellow foam was purified by flash silica gel chromatography, eluting with an isocratic mobile phase 70: 30 EtOAc: Hex supplemented with 1% acetic acid. The product was obtained as a light yellow solid (421 mg, 73%). $[\alpha]_D^{22} = 17.7$ (c = 1.0, MeOH). **¹H-NMR** (400 MHz; DMSO-d₆): δ 13.15 (br s, 1H), 9.58 (s, 1H), 9.39 (s, 1H), 8.90 (d, *J* = 7.5 Hz, 1H), 7.17 (d, *J* = 8.6 Hz, 2H), 7.13 (d, *J* = 8.6 Hz, 2H), 6.68 (d, *J* = 8.6 Hz, 2H), 5.28 (s, 1H), 5.08 (d, *J* = 8.5 Hz, 1H), 4.85 (ddd, *J* = 8.0, 5.3, 2.6 Hz, 1H), 3.34 (t, *J* = 5.3 Hz, 1H), 3.30 (dd, *J* = 4.8, 2.4 Hz, 1H), 1.37 (s, 9H). **¹³C-NMR** (101 MHz, DMSO-d₆): δ 171.2, 171.0, 166.4, 161.8, 157.9, 157.3, 129.6, 129.2, 128.9, 124.9, 116.0, 115.4, 82.1, 78.8, 57.4, 55.3, 47.3, 28.7. **HRMS** (FAB) calculated for C₂₄H₂₇N₃O₈ 486.18764; Found 486.18742 [M+H]⁺.

***N*-tert-Butyloxycarbonyl-Nocardicin G (28b)**

The title compound was prepared and purified analogously to compound **28a** by replacing **27a** with **27b** (470 mg, 0.88 mmol). The product was obtained as a light yellow solid (415 mg, 72%). $[\alpha]_D^{25} = -166.2$ (c = 1.0, MeOH). **¹H-NMR** (400 MHz; DMSO-d₆): δ 13.15 (br s, 1H), 9.60 (s, 1H), 9.39 (s, 1H), 8.77 (d, *J* = 8.2 Hz, 1H), 7.15 (d, *J* = 8.0 Hz, 2H), 7.14 (d, *J* = 8.2 Hz, 2H), 6.78 (d, *J* = 8.6 Hz, 2H), 6.67 (d, *J* = 8.6 Hz, 2H), 5.32 (s, 1H), 5.00 (d, *J* = 8.6 Hz, 1H), 4.85 (ddd, *J* = 7.7, 5.0, 2.4 Hz, 1H), 3.69 (t, *J* = 5.3 Hz, 1H), 2.89 (t, *J* = 2.2 Hz, 1H), 1.36 (s, 9H). **¹³C-NMR** (101 MHz, DMSO-d₆): δ 170.8, 170.7, 166.1, 157.5, 156.9, 154.8, 129.5, 128.6, 128.4, 124.1, 115.5, 115.0, 78.3, 64.9, 56.9, 54.6, 46.4, 28.2. **HRMS** (FAB) calculated for C₂₄H₂₇N₃O₈ 486.18764; Found 486.18738 [M+H]⁺.

***epi*-Nocardicin G-pantetheine (29a)**

To a 10 mL round-bottomed flask equipped with a magnetic stir bar, **28a** (49 mg, 0.10 mmol) was dissolved in 2 mL of reagent grade DMF and to this solution was added K₂CO₃ (42 mg, 0.30 mmol) and cooled to 0 °C with an ice-bath. To this cooled solution was added PyBOP (63 mg, 0.12 mmol) followed by **11** (39 mg, 0.12 mmol) and the reaction mixture was stirred for 30 min at room temperature. The solution was diluted with 40 mL of EtOAc and washed with sat. aq. NH₄Cl (2 × 20 mL), sat. aq. NaHCO₃ (1 × 20 mL) and brine (1 × 20 mL). The EtOAc was concentrated *in vacuo* to a viscous oil, which was re-dissolved in 2 mL 70: 30 ACN: H₂O. The product was purified by Prep Method B, collected, frozen on dry ice and lyophilized to dryness. The lyophilized powder was dissolved in 5 mL of reagent grade TFA and stirred at room temperature for 15 min. The TFA was removed *in vacuo* and the residue was re-suspended in 2 mL of 70: 30 H₂O: ACN supplemented with 0.1% TFA. The freshly deprotected product was purified by Prep Method A, collected on dry ice and lyophilized to dryness to provide the product as a white TFA salt (32 mg, 41%). Isolation of

2 mg of diastereomerically pure material was achieved using Analytical Method B. ¹H-NMR (400 MHz; D₂O): δ 7.26 (d, *J* = 8.7 Hz, 2H), 7.16 (d, *J* = 8.7 Hz, 2H), 6.88 (d, *J* = 8.6 Hz, 2H), 6.84 (d, *J* = 8.5 Hz, 2H), 5.54 (s, 1H), 5.02 (s, 1H), 4.76 (dd, *J* = 7.6, 2.1 Hz, 1H), 3.86 (s, 1H), 3.43 (t, *J* = 5.4 Hz, 1H), 3.40-3.27 (m, 5H), 3.39 (d, *J* = 11.2 Hz, 1H), 3.28 (d, *J* = 11.2 Hz, 1H), 3.02 (app td, *J* = 6.3, 2.5 Hz, 2H), 2.28-2.24 (m, 2H), 0.78 (s, 3H), 0.74 (s, 3H). ¹³C-NMR (101 MHz, D₂O): δ 199.3, 175.0, 173.9, 168.1, 162.8, 157.3, 156.6, 130.6, 130.6, 130.0, 123.9, 123.3, 116.4, 116.0, 75.7, 68.4, 64.9, 54.8, 47.5, 38.6, 38.3, 38.3, 35.3, 35.2, 28.5, 28.5, 20.5, 19.1. HRMS (FAB) calculated for C₃₀H₃₉N₅O₉S 646.25468 Found 646.25354 [M+H]⁺.

Nocardicin G-pantetheine (29b)

The title compound was prepared and purified analogously to compound **29a** by replacing **28a** with **28b** (49 mg, 0.10 mmol). The product was obtained as a TFA salt (34 mg, 44%). Isolation of 2 mg of diastereomerically pure material was achieved using Analytical Method B. ¹H-NMR (400 MHz; D₂O): δ 7.21 (d, *J* = 8.5 Hz, 2H), 7.17 (d, *J* = 8.5 Hz, 2H), 6.84 (2 × d, *J* = 8.5 Hz, 4H), 5.56 (s, 1H), 4.96 (s, 1H), 4.80 (dd, *J* = 4.4, 1.3 Hz, 1H), 3.84 (s, 1H), 3.71 (t, *J* = 5.6 Hz, 1H), 3.37 (d, *J* = 11.2 Hz, 1H), 3.33-3.24 (m, 4H), 3.27 (d, *J* = 11.2 Hz, 1H), 3.09 (dd, *J* = 5.8, 2.4 Hz, 1H), 3.02 (t, *J* = 6.0 Hz, 3H), 2.26 (td, *J* = 6.4, 2.3 Hz, 2H), 0.78 (s, 3H), 0.73 (s, 3H). ¹³C-NMR (101 MHz, D₂O): δ 199.8, 175.0, 174.0, 169.1, 168.8, 157.3, 156.7, 130.8, 130.0, 123.8, 123.3, 116.4, 116.0, 75.7, 68.4, 65.0, 56.0, 54.6, 47.0, 38.6, 38.3, 35.4, 35.2, 28.5, 20.5, 19.1. HRMS (FAB) calculated for C₃₀H₃₉N₅O₉S 646.25468 Found 646.25398 [M+H]⁺.

epi-Nocardicin G-SNAC (30a)

To a 10 mL round-bottomed flask equipped with a magnetic stir bar, **28a** (276 mg, 0.57 mmol) was dissolved in 2 mL of reagent grade DMF and to this solution was added DIEA (297 μL, 1.71 mmol) and cooled to 0 °C in an ice-bath. To this cooled solution was added PyBOP (325 mg, 0.63 mmol) followed by SNAC (63 μL, 0.63 mmol) and the reaction was stirred for 30 min at room temperature. The reaction mixture was diluted with 40 mL of EtOAc and washed with sat. aq. NH₄Cl (2 × 20 mL), sat. aq. NaHCO₃ (1 × 20 mL) and brine (1 × 20 mL). The EtOAc was concentrated *in vacuo* to a viscous oil, which was re-dissolved in 2 mL 70: 30 ACN: H₂O. The reaction was purified by Prep Method A and the product was collected, frozen on dry ice and lyophilized to dryness. The lyophilized powder was dissolved in 5 mL of reagent grade TFA and stirred at room temperature for 15 min. The TFA was removed *in vacuo* and the residue was re-suspended in 2 mL of 70: 30 H₂O: ACN supplemented with 0.1% TFA. The freshly deprotected product was purified by Prep Method A, collected, frozen on dry ice and lyophilized to dryness to provide the product as a white TFA salt (177 mg, 52%). Isolation of 2 mg of diastereomerically pure material was achieved using Analytical Method B. ¹H-NMR (400 MHz; D₂O): δ 7.27 (d, *J* = 8.7 Hz, 2H), 7.15 (d, *J* = 8.7 Hz, 2H), 6.88 (d, *J* = 8.7 Hz, 2H), 6.84 (d, *J* = 8.6 Hz, 2H), 5.54 (s, 1H), 5.03 (s, 1H), 4.77 (dd, *J* = 5.2, 2.6 Hz, 1H), 3.42 (t, *J* = 5.6 Hz, 1H), 3.36 (dd, *J* = 6.0, 2.4 Hz, 1H), 3.26 (td, *J* = 6.2, 1.7 Hz, 2H), 3.01 (td, *J* = 6.2, 1.8 Hz, 2H), 1.76 (s, 3H). ¹³C-NMR (101 MHz, D₂O): δ 199.4, 174.2, 169.1, 168.1, 157.3, 156.6, 130.5, 130.0, 123.9, 123.4, 116.4, 116.0, 64.9, 56.0, 54.8, 47.5, 38.3, 28.4, 21.8. HRMS (ESI) calculated for C₂₃H₂₆N₄O₆S 487.16458 Found 487.1641 [M+H]⁺.

Nocardicin G-SNAC (30b)

The title compound was prepared and purified analogously to compound **30a** by replacing **28a** with **28b** (276 mg, 0.57 mmol). The product was obtained as a white TFA salt (187 mg, 55%). Isolation of 2 mg of diastereomerically pure material was achieved using Analytical Method B. ¹H-NMR (400 MHz; D₂O): δ 7.21 (d, *J* = 8.7 Hz, 2H), 7.16 (d, *J* = 8.7 Hz, 2H),

6.84 (d, $J = 8.7$ Hz, 2H), 6.84 (d, $J = 8.7$ Hz, 2H), 5.55 (s, 1H), 4.96 (s, 1H), 4.80 (dd, $J = 5.3, 2.6$ Hz, 1H), 3.70 (t, $J = 5.6$ Hz, 1H), 3.27 (td, $J = 6.1, 3.4$ Hz, 2H), 3.08 (dd, $J = 5.9, 2.6$ Hz, 1H), 3.02 (t, $J = 6.0$ Hz, 2H), 1.77 (s, 3H). $^{13}\text{C-NMR}$ (101 MHz, D_2O): δ 199.8, 174.2, 169.1, 168.8, 157.3, 156.6, 130.7, 130.0, 123.8, 123.2, 116.3, 116.0, 64.9, 56.0, 54.5, 47.0, 38.3, 28.4, 21.7. **HRMS** (ESI) calculated for $\text{C}_{23}\text{H}_{26}\text{N}_4\text{O}_6\text{S}$ 487.16458 Found 487.1641 $[\text{M}+\text{H}]^+$.

L-[*p*-(hydroxy)phenyl]glycine-L-arginine-*epi*-nocardicin G-SNAC (31 a)

To a 100 mL round-bottomed flask equipped with a magnetic stir bar, compound **15** (281 mg, 0.37 mmol) was dissolved in 10 mL of reagent grade THF. To this solution was added a catalytic amount of Pd-OH/C and the dipeptide was hydrogenated under 1 atm. of H_2 at room temperature for 12 h. The mixture was filtered through Celite, washed with THF (3 \times 50 mL) and the filtrate was concentrated *in vacuo* and used without further purification.

In a separate 10 mL round-bottomed flask equipped with a magnetic stir bar, a mixture of **30a** and **30b** (200 mg, 0.33 mmol) was dissolved in 5 mL of reagent grade DMF containing K_2CO_3 (92 mg, 0.67 mmol) and cooled to 0 $^\circ\text{C}$ in an ice bath. To a separate 10 mL round-bottomed flask, freshly deprotected **15** was dissolved in 2 mL of reagent grade DMF and to this was added K_2CO_3 (46 mg, 0.33 mmol) and cooled to 0 $^\circ\text{C}$ with an ice bath. Once both solutions were sufficiently cooled, PyBOP (160 mg, 0.37 mmol) was added to the flask containing the carboxylic acid and after 1 min, the solution containing **25a** and **25b** was transferred drop-wise over 2 min to the activated acid. The reaction mixture was stirred at 0 $^\circ\text{C}$ for 30 min then at room temperature for 2 h. The solution was diluted with 40 mL of EtOAc and washed with sat. aq. NH_4Cl (2 \times 20 mL), NaHCO_3 (1 \times 20 mL) and brine (1 \times 20 mL). The EtOAc was concentrated *in vacuo* to a viscous oil which was re-dissolved in 2 mL 70: 30 ACN: H_2O . The reaction mixture was purified by Prep Method B and the product was collected, frozen on dry ice and lyophilized to dryness. The lyophilized product was dissolved in 5 mL of reagent grade TFA and stirred at room temperature for 15 min. The TFA was removed *in vacuo* and the residue was re-suspended in 2 mL of 70: 30 H_2O : ACN supplemented with 0.1% TFA. The freshly deprotected product was purified by Prep Method A to provide the product as a white TFA salt (2 mg, 7%). Isolation of 1 mg of diastereomerically pure material was achieved using Analytical Method A. $^1\text{H-NMR}$ (601 MHz; D_2O): δ 7.19 (d, $J = 8.6$ Hz, 2H), 7.18 (d, $J = 8.6$ Hz, 2H), 7.10 (d, $J = 8.6$ Hz, 2H), 6.86 (d, $J = 8.6$ Hz, 2H), 6.83 (d, $J = 8.6$ Hz, 2H), 6.75 (d, $J = 8.6$ Hz, 2H), 5.55 (s, 1H), 5.23 (s, 1H), 5.00 (s, 1H), 4.28 (t, $J = 7.3$ Hz, 1H), 3.46-3.44 (m, 1H) 3.45, 3.42-3.40 (m, 1H), 3.29-3.26 (m, 2H), 3.05-3.01 (m, 4H), 1.76 (s, 3H), 1.69-1.67 (m, 2H), 1.51-1.42 (m, 1H), 1.41-1.35 (m, 1H). **HRMS** (FAB) calculated for $\text{C}_{37}\text{H}_{45}\text{N}_9\text{O}_9\text{S}$ 792.31392 Found 792.31368 $[\text{M}+\text{H}]^+$.

L-[*p*-(hydroxy)phenyl]glycine-L-arginine-nocardicin G-SNAC (31b)

The title compound was prepared and purified analogously to compound **31a**. The product was obtained as a white TFA salt (3 mg, 10%). Isolation of 1 mg of diastereomerically pure material was achieved using Analytical Method B. $^1\text{H-NMR}$ (601 MHz; D_2O): δ 7.18 (d, $J = 8.3$ Hz, 2H), 7.11 (d, $J = 8.1$ Hz, 2H), 7.05 (d, $J = 8.4$ Hz, 2H), 6.84 (d, $J = 8.6$ Hz, 2H), 6.81 (d, $J = 8.6$ Hz, 2H), 6.67 (d, $J = 8.6$ Hz, 2H), 5.58 (s, 1H), 5.14 (s, 1H), 4.97 (s, 1H), 4.23 (t, $J = 7.4$ Hz, 1H), 3.74 (t, $J = 5.4$ Hz, 1H), 3.33-3.27 (m, 2H), 3.15 (dd, $J = 5.1, 2.0$ Hz, 1H), 3.07-3.02 (m, 2H), 2.99 (app td, $J = 7.0, 3.0$ Hz, 2H), 1.80 (s, 3H), 1.65-1.60 (m, 2H), 1.45-1.39 (m, 1H), 1.36-1.31 (m, 1H). **HRMS** (FAB) calculated for $\text{C}_{37}\text{H}_{45}\text{N}_9\text{O}_9\text{S}$ 792.31392 Found 792.31423 $[\text{M}+\text{H}]^+$.

Chemical Equilibrium Noc G-SNAC to *epi*'-Noc G-SNAC Experiment

To determine the rate of spontaneous chemical racemization of Noc G-SNAC **30b** to *epi*-Noc G-SNAC **30a** at a biologically relevant pH, 500 μ L of 1.0 mM Noc G-SNAC in 50 mM K_2PO_4 , pH 7.5 were prepared. 25 μ L of the reaction solution was aliquoted into 15 μ L of a 0.2 % TFA aqueous solution on ice at $t = 1, 2, 5, 10, 15, 20, 30, 45, 65, 80, 120$ and 180 min. Reactions were repeated in triplicate. Quenched reactions were analyzed via HPLC using analytical method B, monitoring absorption at 272 nm. The rate of chemical equilibrium ($k_1 + k_2$) was calculated by fitting the data to a non-linear one-phase decay curve.

Figure 1.
Representative structures of the four classes of naturally occurring β -lactam antibiotics.

Figure 2. Hypothetical Biosynthesis of Nocardicin A.

NocA and NocB together contain five modules which are predicted to produce the pentapeptide L-pHPG-L-Arg-D-pHPG-L-Ser-L-pHPG (**5**) which then may go on to form the first β -lactam containing intermediate nocardicin G (**6**) and ultimately nocardicin A (**4**).

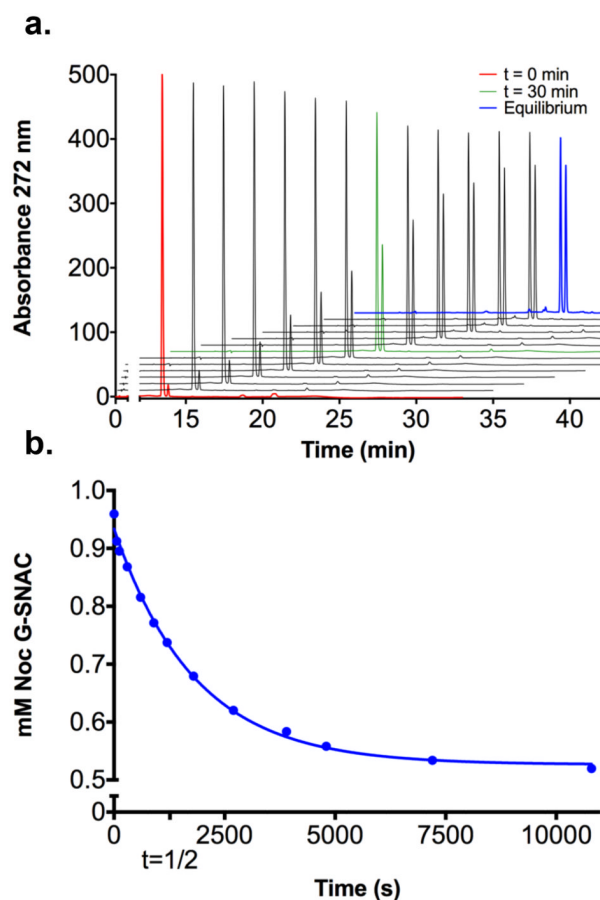

Figure 3. Chemical Equilibrium of Spontaneous Racemization of Nocardicin GSNAC to *epi*-Nocardicin G-SNAC.

a) HPLC analysis of chemical racemization of the α -hydrogen of the *C*-terminal pHPG in nocardicin G-SNAC in 50 mM K_3PO_4 buffer at pH 7.5 as a function of time. **b)** Extent of chemical epimerization was quantified and plotted as a one-phase exponential decay. The rate of chemical epimerization was measured to be $5.5(2) \times 10^{-4} \text{ sec}^{-1} (k_1 + k_2)$.
