### Abstract

**Background**—Although most countries now have at least some restrictions on tobacco marketing, the tobacco industry meet these restrictions by re-allocating expenditure to unregulated channels, such as at point-of-purchase.

---

**Correspondence to** Dr Abraham Brown, Centre for Tobacco Control Research, Institute for Social Marketing, University of Stirling, Stirling FK9 4LA, UK; akb2@stir.ac.uk.

**Competing interests** None.

**Ethics approval** The study was approved by the Institutional Review Board or Research Ethics Board at the University of Stirling (Scotland), the Open University (UK), University of Waterloo (Canada), Roswell Park Cancer Institute (US), University of Illinois, Chicago (US), and The Cancer Council Victoria (Australia).

**Contributors** All authors included on this paper have fulfilled the criteria of authorship, ie, have contributed to the conception and design, acquisition of data analysis or interpretation of data as well as drafting or revising this article. Moreover, there is no one else who fulfils these criteria who has not been included as an author.

**Provenance and peer review** Not commissioned; externally peer reviewed.

**Methods**—Longitudinal data from 10 Canadian provinces in the International Tobacco Control Survey was analysed to examine adult smokers' support for a ban on tobacco advertising and displays in stores and whether this support is associated with noticing either advertising or displays in stores, and quit intentions, over time. In total, there were 4580 respondents in wave 5 (October 2006 to February 2007), wave 6 (September 2007 to February 2008) and wave 7 (October 2008 to June 2009). The surveys were conducted before, during and in some cases after the implementation of display bans in most Canadian provinces and territories.

**Results**—Smokers in all provinces showed strong support for a ban on tobacco displays over the study period. Levels of support for an advertising and display ban were comparable between Canadian provinces over time, irrespective of whether they had been banned or not. Noticing tobacco displays and signs in-store was demonstrably less likely to predict support for displays (OR=0.73, p=0.005) and advertising (OR=0.78, p=0.02) ban, respectively. Smokers intending to quit were more likely to support advertising and display bans over time.

**Conclusion**—This study serves as a timely reminder that the implementation of tobacco control measures, such as the removal of tobacco displays, appear to sustain support among smokers, those most likely to oppose such measures.

## INTRODUCTION

For decades, tobacco marketing has been used to portray tobacco use in a favourable light, normalise smoking, underplay the associated health risks and ultimately undermine tobacco control efforts.<sup>12</sup> The Framework Convention on Tobacco Control,<sup>3</sup> currently with 172 signatories covering almost 90% of the global population, obligates member parties to introduce comprehensive bans on tobacco marketing. The need for bans to be comprehensive is based on evidence that the tobacco industry adeptly exploits unregulated channels, such as at point-of-purchase (POP), to maintain and even increase consumption.<sup>45</sup>

POP marketing includes advertising as well as displays of tobacco products on, behind and above the service counter. Displays in particular increase exposure to tobacco products and normalise tobacco use, especially for young people.<sup>467</sup> They also provide powerful cues to smoke<sup>89</sup> and stimulate impulse purchases among adult smokers, recent quitters and those intending to quit.<sup>810-13</sup> The effectiveness of displays at POP helps explain why the tobacco industry have increased marketing expenditure within the retail environment, especially when other marketing channels have been closed off to them.<sup>514</sup>

The tobacco industry vehemently opposes the removal of POP advertising and particularly product displays, presumably as they are aware of their importance as marketing tools.<sup>813</sup> As displays remain one of the few viable means for promoting tobacco products, understanding the level of support for their removal among smokers, the group most likely to be opposed to such restrictions, and whether support is associated with quit intentions can help inform tobacco control policy. To date, however, research assessing smokers' support for the removal of tobacco advertising and displays within shops, and intention to quit, remains scarce, whether in countries that have banned displays or are yet to do so.<sup>13-15</sup>

In Canada, although the Tobacco Act 1997 banned various forms of tobacco marketing, in-store advertising such as portrayals of signs that indicate the availability of tobacco products and their prices were permitted.<sup>16</sup> In accordance with the regulations, tobacco products or accessories that display a tobacco-related brand may be allowed at retail outlets. Nonetheless, since 2002, several provinces and territories have passed laws requiring the removal of tobacco displays and associated advertising, despite strong opposition from the tobacco and retail industries predicting that the move to 'out of sight' tobacco sales would drive retailers out of business, a finding not substantiated by the evidence.<sup>17</sup>

Research in Ireland showed that at a population level, support for a display ban increased over a 9-month period before and after implementing the policy.<sup>14</sup> This study, and other research, indicates smokers to be supportive of display bans because these displays are considered to have promotional appeal<sup>18</sup> that may provide visual cues to would-be starters and recent quitters.<sup>8,18</sup> A recent cross-sectional study found that four times as many smokers were supportive of a ban on displays than were unsupportive (49% vs 12%).<sup>5</sup> No research, however, has empirically examined, over a longer time period, whether the introduction of a display ban is associated with an increase in support or whether support is associated with quitting behaviour, as we have seen for smoke-free policies. We extend existing research by examining whether adult smokers' support for the removal of tobacco advertising and displays in stores has increased between 2006 and 2009 in 10 Canadian provinces, where they have been removed before, during and after the study period.

This paper addresses three research questions: (1) What was the impact of the ban on tobacco displays in several Canadian provinces on smokers' support for such a ban over time? (2) Did noticing tobacco displays and signs in stores predict support for a ban on advertising and displays over time? and (3) What are the associations between intentions to quit and support for a ban on advertising and displays at POP?

## METHODS

### Data and analytic sample

The International Tobacco Control Four Country Survey is a quasi-experimental longitudinal telephone survey conducted annually with nationally representative samples of adult smokers aged 18 years or older in Canada, the USA, the UK and Australia. The survey is designed to evaluate the psychosocial and behavioural impact of key national-level tobacco policies in these four countries over time.

Participants are recruited by geographically stratified probability sampling, with telephone numbers selected at random in each country. Eligible households are identified by asking a household informant the number of adult smokers within the household, with smokers defined as having smoked >100 cigarettes in their life and at least once in the past 30 days. Where there was more than one eligible respondent, the next birthday method was used to select the target respondent in that household.<sup>20</sup> In order to maintain a sample size of at least 2000 within each country, replenishment is used each year to replace those lost to attrition, using random sampling from the same sampling frame. A full description of the methodology and sampling procedure can be found elsewhere.<sup>19,21</sup>

This study presents data from wave 5 (October 2006 to February 2007), wave 6 (September 2007 to February 2008) and wave 7 (October 2008 to June 2009). We used all available respondents that participated at one or more of the three waves. A total of 4580 respondents comprising only smokers from 10 Canada provinces were used for this study. We focus exclusively on Canada and do not include Australia, the UK or the USA, given that only in Canada had some provinces and territories actually banned the display of tobacco products during the study period. All Australian states and territories have now passed legislation to move tobacco out of sight in general retail stores by January 2012, and the Scottish and English governments plan to do likewise in large shops and supermarkets by April 2012.

The implementation of the ban on tobacco displays in the 10 Canadian provinces occurred before, during and after the study period. Consequently, the 10 provinces were categorised into five zones to reflect provinces that had fully implemented a display ban prior to (zone 1), during (zones 2, 3 and 4) and after (zone 5) the study period (table 1). This permitted comparisons of provinces that had banned in-store displays and advertising before and

during the study period (classified as the treatment groups), with provinces that had not banned the display of tobacco at POP (classified as the control groups). Three Canadian territories (Yukon, Nunavut and Northwest Territories) were not included in the analysis because they have an average of 35 000 people (each territory has 0.1% of the total population of Canada).

The study was approved by the Institutional Review Board or Research Ethics Board at the University of Stirling (Scotland), the Open University (UK), University of Waterloo (Canada), Roswell Park Cancer Institute (USA), University of Illinois, Chicago (USA), and The Cancer Council Victoria (Australia).

## MEASURES

### Outcome measures: support for bans on POP advertising and displays

Two items were employed to measure support for a ban on POP advertising and displays: “Do you support complete bans on tobacco advertisements inside shops and stores?” and “Do you support complete bans on displays of cigarettes inside shops and stores?” Both were measured on a 3-point scale with the response options ‘A lot’, ‘Somewhat’ and ‘Not at all’. For the Generalised Estimating Equations (GEE) analyses, this 3-point scale was dichotomised to give: *support for complete bans* (A lot, Somewhat) vs *does not support complete bans* (Not at all).

### Intention to quit

A 4-point scale that measured readiness to quit<sup>2223</sup> was dichotomised to compare smokers with any intention to quit and those without.

### Covariates

Covariates included were: zones (between Canadian zones comparisons), wave (5\* vs 6 vs 7), gender (male\* vs female), ethnicity (Caucasian vs other\*), age (18–24 vs 25–39 vs 40–54 vs 55+\*), income (low vs moderate vs high\*) and education (low vs moderate vs high\*), where \* indicates the baseline or reference level. Consistent with Borland *et al*'s<sup>24</sup> study, a heaviness of smoking index combined responses about cigarettes per day and time to first cigarette (range 0–6). In addition, two interactions of main interest being zone × wave and education × income were considered.

Respondents were also asked two specific questions about their awareness of tobacco displays and signs in stores or shops: “In the last month, have you seen cigarette packages being displayed, including on shelves or on the counter?” and “In the last month, have you seen any signs or pictures or other things like clocks with cigarette brands or logos inside shops or stores?” Response to both was dichotomised as ‘yes’ (coded as 1) or ‘no’ (coded as 0).

## SURVEY WEIGHTS

Cross-sectional survey weights were computed for respondents using reciprocals of inclusion probabilities. Departures from proportional allocation to geographic strata over time were adjusted for and calibrated to sum to numbers of smokers in age–sex groups. Hence, respondents are weighted to be representative of the adult smoker population in each province. Respondents that completed the follow-up surveys (ie, waves 6 and 7) had their baseline weights (wave 5) adjusted for attrition.<sup>21</sup> All analyses described in this paper are weighted.

## DATA ANALYSIS

Analyses were conducted using SAS 9.2, a statistical software. GEE<sup>25–27</sup> were used to examine whether smokers' support for removal of advertising and displays at POP changed over time (waves 5, 6 and 7). GEE models were assessed via binomial variations and the logit link to determine whether the observed changes in policy support over time were greater in Canadian provinces with display bans than they were in those without bans. This approach accounted for the correlated nature of data within subjects across waves and permitted the assessment of the population averaged over the study period without requiring individuals to be present at each wave. All GEE models were specified via the exchangeable within-group correlation structure.

The observed changes in policy support were evaluated by testing the zone  $\times$  wave interaction effect in the various GEE models. Coefficients of covariates of interest (predictor variables) such as noticing tobacco displays and signs in stores and key demographics in the models were exponentiated to estimate the OR of policy support. For each coefficient, the p values and associated 95% CIs for the ORs are estimated via SEs.

## RESULTS

### Support for a ban on POP advertising and displays in the five Canadian zones

Policy support was greatest in zones 1 and 2 where there was early adoption of the display bans across the three waves, and lowest in zone 5 which was a late adopter, with just over half of smokers expressing support at each wave. Level of support for a display ban was fairly consistent between zones at wave 5, but relatively dispersed by wave 7 (see figure 1).

Similarly, support for a complete advertising ban was higher in zone 2 across the three waves and comparable in the remaining four zones as shown in table 2. Over two-thirds of smokers from zones 1 to 3 reported support for a ban on advertising at each wave. Additionally, level of support for a ban on advertising at POP was relatively consistent at wave 5 between zones but quite dispersed by wave 7 (figure 2).

### Support for bans on advertising and displays in the five Canadian zones and their associations with intention to quit over time

Table 3 presents weighted GEE models for smokers who support advertising and display bans over time and the relationship this support has with quit intentions. Drawing from these results, the overall zone  $\times$  wave interaction effect (not shown in table 3) indicated that support for a ban on displays was comparable across five Canadian zones over time ( $p>0.05$ ). Similarly, between-zone comparisons showed that support among smokers in Canada was comparable over the last three waves ( $p>0.05$ ). However, smokers in Canada who intend to quit smoking were 2.32 times more likely to support a display ban over time ( $p<0.0001$ ). Smokers who noticed tobacco displays in stores were less supportive of a display ban over time (OR=0.73,  $p=0.005$ ).

Comparisons also showed that the overall zone  $\times$  wave interaction across the five Canadian zones showed no overall difference among these jurisdictions in the levels of support for tobacco advertising ban over the three waves. Likewise, between-zone comparisons showed that support for a ban on advertising was comparable over the study period ( $p>0.05$ ). Comparisons with quit intentions revealed that smokers intending to quit smoking in Canada were 2.11 times more supportive of a ban on advertising than those who did not intend to quit. Smokers who noticed tobacco advertising in stores were less likely to support a ban on advertising (OR=0.78,  $p=0.02$ ).

## DISCUSSION

Although denied the use of traditional marketing channels, the tobacco industry continues to use the retail environment to market their goods.<sup>58</sup> We investigated adult smokers' support for a complete ban on tobacco advertising and displays at POP across 10 Canadian provinces and how this relates to their intention to quit over time.

It was found that smokers in Canada had high levels of support for the removal of displays over the study period. This support, among those most likely to oppose such measures, has been found in respect to support for other tobacco control policies such as tobacco advertising and promotion bans,<sup>2829</sup> pictorial warning labels<sup>30</sup> and smoke-free public places.<sup>31</sup> The findings demonstrate the need for comprehensive bans on tobacco marketing, as included in Article 13 of the Framework Convention on Tobacco Control.<sup>32</sup>

Support was found to be greatest among smokers in Canadian provinces who were exposed to the policy at baseline, for example, at second follow-up, more than three-quarters of smokers in Saskatchewan, Manitoba and Prince Edward Island were supportive of a display ban compared with just over half of smokers in Newfoundland and Labrador, the only province not to ban displays until after the study period. There was, however, no significant difference in levels of support for a display ban across the 10 provinces and over the study period. It is possible that the comparable levels of support is indicative of the diffusion effect<sup>33-36</sup> of the display ban (as a consequence of public campaign, lawsuit and debate surrounding its removal) from provinces such as Saskatchewan, Manitoba and Prince Edwards Island, to those which had either a partial ban or no ban. Further research would be needed to confirm this, but past research has found diffusion of policy support for smoke-free legislation across geographically dispersed smokers.<sup>333436</sup> We found no significant difference in reported levels of support for a ban on advertising at POP across the 10 provinces either.

Smokers in Canadian provinces who noticed tobacco displays and signs in stores were less likely to support a ban on advertising and displays. That smokers exposed to in-store tobacco promotion were less supportive of the ban suggests that the, perhaps reassuring, presence of these visual cues weakens support. Smokers who had intentions to quit smoking were supportive of a ban on tobacco advertising and displays. This support may, in part, be a consequence of not having to be exposed to attractive visual cues to smoke within the retail environment, with displays found to stimulate impulse purchase among those trying to quit.<sup>8</sup>

Despite the use of a longitudinal design, our study is not without limitations. Respondents are lost to attrition at follow-up, which can potentially skew findings. As the analyses were performed via weighted GEE,<sup>2526</sup> which allows these models to use all observations across the three waves, the potential effects of respondents lost to follow-up are minimised. There is also the possibility of differential bias between zones, as a result of the demand characteristics of the survey, which may have prompted socially desirable responding or may be influenced by personal experience or media coverage of policy implementation. Another potential limitation is the possibility of experiment-wise error as a result of the number of between-zone comparisons, that is, the likelihood of falsely rejecting the null hypothesis as a result of multiple comparisons. Finally, the no in-zone change in level of policy support over time may be due to lack of earlier data as well as the short study period.

In many countries, tobacco marketing at POP is one of the few remaining avenues for the tobacco industry to promote their products. Tobacco displays act as a potent marketing tool,<sup>51213</sup> which normalise smoking and allow the tobacco industry to communicate with non-smokers, ex-smokers and established smokers.<sup>123738</sup> That most smokers are supportive of banning the visible display of tobacco products in the retail environment, as they are with

other tobacco control policies, should help persuade policy makers in other jurisdictions about the need to remove POP displays. Future research should assess the longer term impact of a display ban on smokers' support and if this support is linked to intention to quit, especially as a decline in exposure to displays at retail environment is anticipated to impact upon smoking cues and behaviour.

### What this paper adds

- ▶ The tobacco industry is known to respond to restrictions on marketing by exploiting unregulated channels, such as at point-of-purchase.
- ▶ This paper shows that levels of support for a display ban at point-of-purchase were high and comparable across all 10 provinces in Canada, irrespective of whether tobacco displays within shops had been banned in each of these provinces.
- ▶ Support was lowest, however, in Newfoundland and Labrador, the only province not to introduce a ban on displays during the study period. Smokers intending to quit were more likely to support advertising and display bans over time.

**Figure 1.**  
Support for a ban on point-of-purchase tobacco displays by waves and zones.

**Figure 2.**  
Support for a ban on point-of-purchase tobacco advertising by waves and zones.

**Table 1**

Implementation dates of bans on the display of tobacco at point-of-purchase in Canadian Provinces and Territories

<b>Jurisdiction</b>	<b>Date of implementation</b>	<b>Zone</b>	<b>Period</b>
Manitoba	1 January 2004	1	Pre
Nunavut	1 February 2004	1	Pre
Saskatchewan	1 January 2005*	1	Pre
Prince Edward Island	1 June 2006	1	Pre
Wave 5	2006/2007		
Northwest Territories	21 January 2007	2	Mid
Nova Scotia	31 March 2007	2	Mid
Wave 6	2007/2008		
British Columbia	31 March 2008	3	Mid
Ontario	31 May 2008	3	Mid
Quebec	31 May 2008	3	Mid
Alberta	1 July 2008	3	Mid
New Brunswick	1 January 2009	4	Mid
Yukon	15 May 2009	4	Mid
Wave 7	2008/2009		
Newfoundland and Labrador	1 January 2010	5	Post

NB: Three Canadian territories (Nunavut, Yukon, and Northwest Territories) were excluded in the analysis because of small population size.

\* Saskatchewan legislation banned retail displays of tobacco in 2002, but this was declared invalid because of a challenge by the tobacco industry. However, the Supreme Court of Canada unanimously upheld the constitutionality of the legislation in January 2005.

	Wave 5 (%)	Wave 6 (%)	Wave 7 (%)
Zone 1			
Support display ban	99 (67.2)	121 (73.2)	96 (82.5)
Support ad ban	99 (68.0)	114 (68.6)	91 (75.7)
Zone 2			
Support display ban	46 (72.9)	58 (72.2)	57 (75.3)
Support ad ban	49 (75.0)	58 (75.1)	64 (85.7)
Zone 3			
Support display ban	881 (61.0)	858 (63.6)	836 (72.8)
Support ad ban	986 (68.0)	945 (70.8)	848 (72.8)
Zone 4			
Support display ban	34 (74.0)	25 (69.7)	23 (69.1)
Support ad ban	32 (69.3)	25 (60.7)	24 (67.3)
Zone 5			
Support display ban	23 (56.9)	35 (65.7)	22 (55.0)
Support ad ban	27 (69.5)	38 (76.4)	22 (53.5)

Zone 1, Saskatchewan, Manitoba and Prince Edward Island; zone 2, Nova Scotia; zone 3, Quebec, Ontario, Alberta and British Columbia; zone 4, New Brunswick; zone 5, Newfoundland and Labrador.

**Table 3**

GEE models\* for support for a ban on POP display and advertising across the three waves and association with quit intentions and noticing tobacco displays and signs in stores

	POP display ban		POP advertising ban	
	OR (95% CI)	p Value	OR (95% CI)	p Value
Gender				
Female versus male	1.07 (0.09 to 1.27)	0.44	1.17 (0.98 to 1.39)	0.08
Age, years				
18–25 vs 55+	0.86 (0.61 to 1.21)	0.39	0.93 (0.65 to 1.33)	0.69
25–39 vs 55+	0.95 (0.75 to 1.20)	0.66	0.94 (0.73 to 1.22)	0.63
40–54 vs 55+	1.06 (0.85 to 1.30)	0.62	0.95 (0.77 to 1.87)	0.68
Quit intentions	2.32 (1.94 to 2.77)	<0.0001	2.11 (1.76 to 2.54)	<0.0001
Noticed display/signs	0.73 <sup>†</sup> (0.59 to 0.91)	0.005	0.78 <sup>‡</sup> (0.64 to 0.95)	0.015

The overall wave (time) and zone effect and their interaction and also between-zone comparisons for POP display and advertising ban (all not shown in table) were not significant ( $p>0.05$ ).

Design variable for wave (time) was coded: wave 5 (0, 0), wave 6 (1, 0) and wave 7 (0, 1).

\* Each model is adjusted for age, sex, quit intentions, awareness of cigarette displays and signs in stores and shops as well as income, education, heaviness of smoking index and ethnicity, but these are not shown as they were not significant.

<sup>†</sup> Noticing tobacco signs in stores.

<sup>‡</sup> Noticing tobacco displays in stores.

POP, point-of-purchase.
