Coronary artery anomaly

Anomalous left circumflex

Congenital coronary anomaly

A 45-year-old gentleman, with no coronary risk factors had a mildly positive exercise stress test. Clinical examination ECG and chest X-ray were normal. Coronary angiogram showed ectatic left anterior descending (Fig. 1A, Video 1) and right coronary artery (Fig. 1B, Video 2) collateraling the left circumflex artery which was seen to drain into main pulmonary artery. A coronary CT angiogram showed an anomalous origin of left circumflex artery from the right pulmonary artery (Fig. 1C and D).

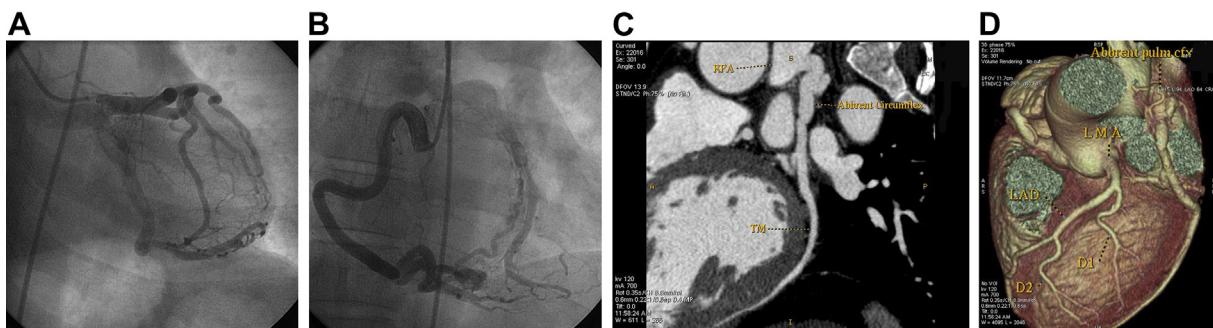

Fig. 1 – Anomalous origin of left circumflex artery from pulmonary artery. (A) Left coronary angiogram (RAO projection) showing LCX (arrow) filling through collaterals from LAD and draining into MPA. (B) Right coronary angiogram (AP projection) showing LCX (arrow) filling through collaterals from RCA and draining into MPA. (C) CT angiogram showing anomalous origin of LCX from RPA. (D) CT reconstruction showing anomalous origin of LCX from RPA. RAO – Right Anterior Oblique; LCX – Left Circumflex; RCA – Right Coronary Artery; AP – Antero Posterior; RPA – Right Pulmonary Artery; MPA – Main Pulmonary Artery.
