Edited by S. Parkin, University of Kentucky, USA

The asymmetric unit of the title compound, $C_{15}H_{23}NO_5$, contains two independent molecules. Phaeosphaeride A contains two primary sections, an alkyl chain consisting of five C atoms and a cyclic system consisting of fused five- and six-membered rings with attached substituents. In the crystal, the molecules form layered structures. Nearly planar sheets, parallel to the (001) plane, form bilayers of two-dimensional hydrogen-bonded networks with the hydroxy groups located on the interior of the bilayer sheets. The network is constructed primarily of four $O-H\cdots O$ hydrogen bonds, which form a zigzag pattern in the (001) plane. The butyl chains interdigitate with the butyl chains on adjacent sheets. The crystal was twinned by a twofold rotation about the c axis, with refined major-minor occupancy fractions of 0.718 (6): 0.282 (6).

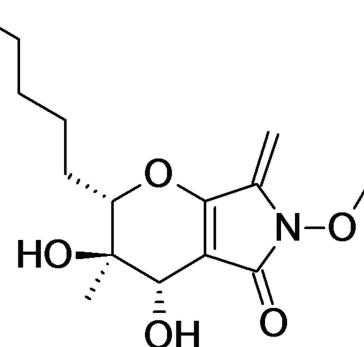

Keywords: crystal structure; natural phaeosphaeride A.

Crystal structure of natural phaeosphaeride A

Victoria V. Abzianidze, Ekaterina V. Poluektova, Ksenia P. Bolshakova, Taras L. Panikorovskii, Alexander S. Bogachenkov and Alexander O. Berestetskiy

S1. Comment

In 2006, Clardy and colleagues isolated phaeosphaeride A from an endophytic fungus FA39 (Maloney *et al.*, 2006). Phaeosphaeride A turned out to be an inhibitor of signal transduction and an activator of transcription 3 (STAT3)-dependent signaling. It was reported to selectively inhibit STAT3/DNA binding with an IC₅₀ of 0.61 mM and to exhibit promising cell growth inhibition in STAT3-dependent U266 multiple myeloma cells with an IC₅₀ of 6.7 μM.

While the relative stereochemistry of phaeosphaeride A was deduced on the basis of NOE experiments, its absolute configuration remained undetermined (Maloney *et al.*, 2006). Moreover, the attempts of total synthesis of phaeosphaeride A showed considerable differences in ¹H and ¹³C NMR data between the synthetic and natural phaeosphaeride A (Kobayashi *et al.*, 2011; Chatzimpaloglou *et al.*, 2012, 2014). In 2015, Kobayashi and colleagues established the relative and absolute configurations of natural phaeosphaeride A by completing the first total synthesis of ent-phaeosphaeride A (Kobayashi *et al.*, 2015).

Our research group isolated phaeosphaeride A from a fungal strain belonging to the genus *Phoma*. Phaeosphaeride A was obtained as an optically active (-108.33 (c 0.06, CH₂Cl₂)) yellow glass. ¹H and ¹³C NMR data as well as mass spectra of our phaeosphaeride A match with the data reported for Clardy's natural phaeosphaeride A (Maloney *et al.*, 2006). Optical rotation of Clardy's product (-93.6 (c 2.0, CH₂Cl₂)) and our phaeosphaeride A have the same sign. In this work we describe the crystal structure of natural phaeosphaeride A.

S2. Experimental

NMR spectra were recorded on a Bruker AVANCE III 400 MHz spectrometer in DMSO-d6. The same solvent was used as an internal standard. High-resolution mass spectra (HRMS) were recorded on a LTQ Orbitrap Velos spectrometer. Optical rotations were determined on an Optical Activity AA-55 polarimeter using a 20 cm cell with a Na 589 nm filter.

Phaeosphaeride A was isolated from solid culture of the fungus *Phoma* sp. N 19. The microorganism was obtained from leaves of *Cirsium arvense* (L.) Scop. and deposited in the culture collection of the All-Russian Institute of Plant Protection (Saint-Petersburg, Russian Federation). The metabolite was purified from the fungal extract with a combination of preparative column chromatography and TLC on silica gel to give phaeosphaeride A as a yellow precipitate. (-108.33 (c 0.06, CH₂Cl₂); ¹H NMR (400 MHz, DMSO-d6) δ 5.44 (d, J = 5.8 Hz, 1H), 4.97 (s, 2H), 4.92 (s, 1H), 4.07 (d, J = 11.3 Hz, 1H), 3.86 (d, J = 5.8 Hz, 1H), 3.79 (s, 3H), 1.82 (m, 1H), 1.58–1.22 (m, 7H), 1.19 (s, 3H), 0.86 (t, J = 6.4 Hz, 3H); ¹³C NMR (100.6 MHz, DMSO-d6) δ 166.53, 155.30, 137.12, 104.80, 90.80, 86.25, 70.96, 64.36, 63.76, 30.90, 27.60, 26.11, 21.96, 20.40, 13.85; HRMS [M + H]⁺ calcd for C₁₅H₂₄NO₅ 298.16490, found 298.16493. Recrystallization from heptane yielded yellow crystals (-116.66; -108.33 (c 0.06, CH₂Cl₂)).

S3. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 1.

H atoms bonded to C atoms were included in calculated positions and refined using a riding model, with $U_{iso}(H)$ set to $1.2U_{eq}(C)$ and $C-H = 0.97 \text{ \AA}$ for CH_2 groups, $U_{iso}(H)$ set to $1.5U_{eq}(N)$ and $C-H = 0.96 \text{ \AA}$ for CH_3 groups and $U_{iso}(H)$ set to $1.2U_{eq}(N)$ and $C-H = 0.93 \text{ \AA}$ for CH groups. All H atoms bonded to O atoms were located in a difference Fourier map and were refined with distance restraints and constrained displacement parameters OH 0.82 \AA and $U_{iso}(H)$ set to $1.2U_{eq}(O)$. The large thermal ellipsoid on C13 is characteristic for the distal end of long alkyl chains.

The structure of phaeosphaeride A (Fig. 1) was refined as rotational twin [by a two-fold rotation about (001)] with twin fractions of 0.718 (6) and 0.282 (6). The 'HKLF 5' format file for the final refinement was generated by the TwinRotMat facility in Platon (Spek, 2009). The ratio $(F_c^2 - F_o^2)/\text{esd}$ for the reflections with the highest error in final refinement model (as a rotational twin) has lower residuals than in the initial solution. We have used Bayesian Statistics for verifying absolute structure. Supplementary crystallographic data for this paper have been deposited at Cambridge Crystallographic Data Centre (CCDC 1412515) and can be obtained free of charge via www.ccdc.cam.ac.uk/data_request/cif.

S4. Geometry

The asymmetric unit contains two independent molecules of phaeosphaeride A (I and II) (fig. 1). Each molecule of phaeosphaeride A (numbering of atoms of phaeosphaeride A is given according to Clardy (Maloney *et al.*, 2006)) contains two primary sections; an alkyl chain consisting of C(13)—C(12)—C(11)—C(10)—C(9) atoms and a cyclic system consisting of five and six membered rings with adjacent atoms.

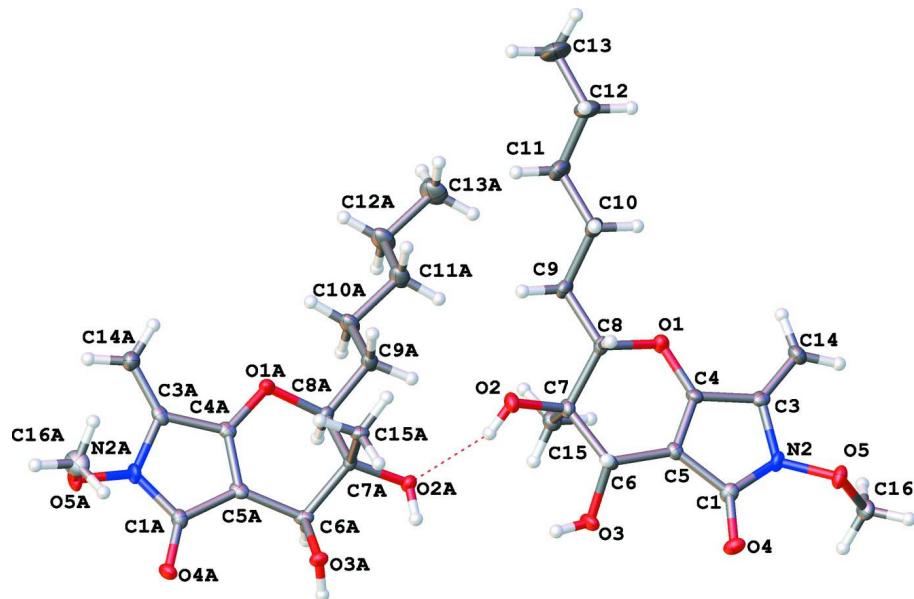

For the five-membered ring C(1)—N(2)—C(3)—C(4)—C(5) of molecule I the Cremer-Pople (Cremer & Pople, 1975) parameters are $Q=0.0714 \text{ \AA}$, $\phi=197.99^\circ$, revealing a slightly distorted half-chair (2T_1) conformation. Cremer-Pople parameters of $Q=0.501 \text{ \AA}$, $\theta=128.71^\circ$, $\phi=88.01^\circ$ for the six-membered heterocycle of molecule I are consistent with a half-chair conformation (5H_4). The geometric parameters of the six-membered rings for both molecules are similar, but the five-membered rings have different conformations. The five-membered ring in molecule II exhibits an envelope (1E) conformation.

Torsion angles O(1)—C(4)—C(5)—C(1) and C(3)—C(4)—C(5)—C(6) are $-178.2 (4)^\circ$ and $-177.1 (4)^\circ$ respectively, corresponding to co-planar conformation between the five and six-membered rings. The geometry of the heterocyclic ring system of the molecule (base of the half chair and the five-membered ring) is close to planar.

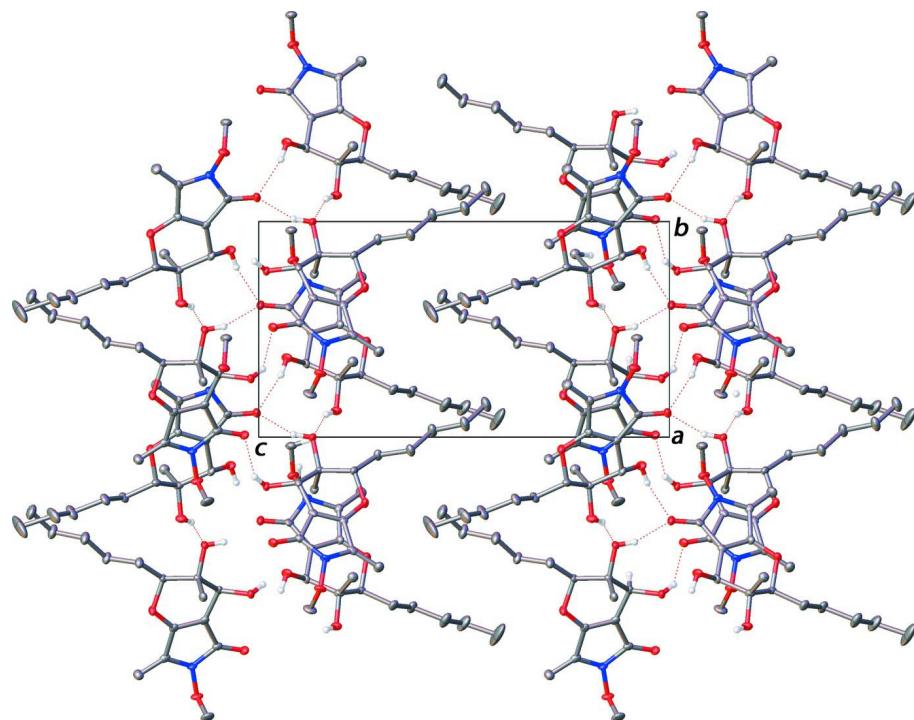

The exocyclic alkyl chain of I and the back of the half-chair lie approximately in the same plane. The deviation between the plane of alkyl atoms C(8)—C(9)—C(10)—C(11)—C(12)—C(13) and the back of the chair is $9.7 (4)^\circ$.

The geometric parameters are similar for both molecules I and II forming the weak hydrogen-bonded dimer through O2—H2 \cdots O2A. But angles characterizing the methoxy groups N(2)—O(5)—C(16) are slightly different ($109.9 (3)^\circ$ for I and $110.4 (4)^\circ$ for II). The difference between angles O(4)—C(1)—C(5) is much greater with values of $129.4 (4)^\circ$ and $123.2 (4)^\circ$ for I and II respectively.

The molecules form layered structures. Nearly planar sheets, parallel with the (001) plane, form primary layers of two-dimensional hydrogen-bonded networks with the hydroxyl moieties located on the interior of the sheets. The network (Fig. 2) is dependent primarily on four hydrogen bonds (Table 1) O2—H2 \cdots O2A, O3—H3 \cdots O4, O2A—H2A \cdots O4, O3A—H3A \cdots O4A (Desiraju *et al.*, 1999; Arunan *et al.*, 2011). In the (001) plane, two-dimensional hydrogen-bonded networks form a zig-zag pattern. The aliphatic butyl chains interdigitate with the butyl chains on the adjacent sheets.

**Figure 1**

A view of molecules I (left) and II (right) of phaeosphaeride A. The atom numbering scheme is that of Maloney *et al.* (2006). Displacement ellipsoids are shown at the 50% probability level.

**Figure 2**

Projection of the layered crystal structure of phaeosphaeride A on the (100) plane. The dashed lines indicate the short contacts between molecules of phaeosphaeride A (only hydrogen atoms forming hydrogen bonds are shown).

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refined as a 2-component twin.
