ABSTRACT

Background: The fruits of *Barringtonia racemosa* and *Hibiscus sabdariffa* have been used in the treatment of abscess, ulcer, cough, asthma, and diarrhea as traditional remedy. **Objective:** This study aims to evaluate cytotoxic effect of *B. racemosa* and *H. sabdariffa* methanol fruit extracts toward human breast cancer cell lines (MCF-7) and its antioxidant activities.

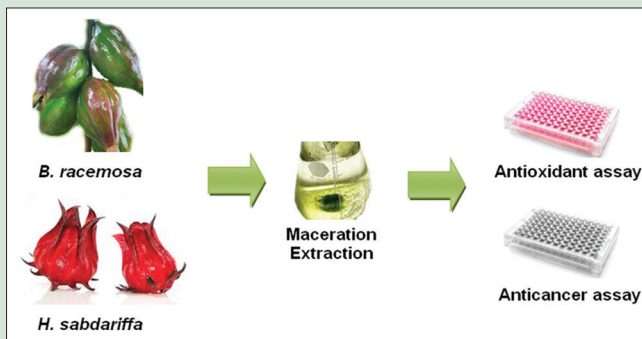

Materials and Methods: Total antioxidant activities of extracts were assayed using 2,2'-diphenyl-1-picrylhydrazyl radical (DPPH) and β -carotene bleaching assay. Content of phytochemicals, total flavonoid content (TFC), and total phenolic content (TPC) were determined using aluminum chloride colorimetric method and Folin–Ciocalteu's reagent, respectively. Cytotoxic activity *in vitro* was investigated through 3-(4, 5-dimethylthiazol-2-yl)-2, 5-diphenyl tetrazolium bromide (MTT) assay. **Results:** *B. racemosa* extract exhibited high antioxidant activities compared to *H. sabdariffa* methanol fruit extracts in DPPH radical scavenging assay (inhibitory concentration [IC₅₀] 15.26 ± 1.25 µg/mL) and β -carotene bleaching assay (I% 98.13 ± 1.83%). *B. racemosa* also showed higher TPC (14.70 ± 1.05 mg gallic acid equivalents [GAE]/g) and TFC (130 ± 1.18 mg quercetin equivalents [QE]/g) compared to *H. sabdariffa* (3.80 ± 2.13 mg GAE/g and 40.75 ± 1.15 mg QE/g, respectively). In MTT assay, *B. racemosa* extract also showed a higher cytotoxic activity (IC₅₀ 57.61 ± 2.24 µg/mL) compared to *H. sabdariffa*. **Conclusion:** The present study indicated that phenolic and flavonoid compounds known for oxidizing activities indicated an important role among the contents of these plants extract. *B. racemosa* methanol extract have shown potent cytotoxic activity toward MCF-7. Following these promising results, further fractionation of the plant extract is underway to identify important phytochemical bioactives for the development of potential nutraceutical and pharmaceutical use.

Key words: Antioxidant activities, *Barringtonia racemosa*, Cytotoxic activity, *Hibiscus sabdariffa*, Phytochemistry

SUMMARY

- The phenolic and flavonoid compounds were present in *B. racemosa* and *H. sabdariffa* methanol extracts
- *B. racemosa* methanol extract was found to be potent antioxidant activity
- *B. racemosa* methanol extract have shown potent cytotoxic activity (IC₅₀ 57.61 ± 2.24 µg/mL) toward MCF-7

- The phenolic and flavonoid compounds may contribute to the antioxidant and cytotoxic activity of *B. racemosa*.

Abbreviations Used: MCF-7: Human breast cancer cell lines, DMEM: Modified eagle medium, DPPH: 2,2'-diphenyl-1-picrylhydrazyl radical, TPC: Total phenolic content, Na₂CO₃: Sodium carbonate, GAE: Gallic acid equivalents, TFC: Total flavonoid content, NaNO₂: Sodium nitrite, AlCl₃: Aluminum chloride, NaOH: Sodium hydroxide, QE: Quercetin equivalents, MTT: 3-(4, 5-dimethylthiazol-2-yl)-2, 5-diphenyl tetrazolium bromide, IC₅₀: Inhibitory concentration, ANOVA: Analysis of variance, DLA: Dalton's lymphoma ascitic.

INTRODUCTION

In recent decades, natural antioxidants have been garnering more attention due to the less adverse reactions compared to synthetic agents. Antioxidants have the ability to prevent some cell damage caused by free radicals and reactive oxygen species. Antioxidant activity as a research methodology is important to assess the scientific basis for the known traditional herbal medicines which claimed to have antioxidant properties.^[1,2]

Cancer is a much-feared disease in the modern society, and is one of the leading causes of mortality worldwide.^[3] The National Cancer Registry of Malaysia reported a total of 21,773 cancer cases diagnosed in Peninsular Malaysia in 2006.^[4] An ideal anticancer agent is expected to inhibit the progression of cancer through its cytotoxicity properties.^[5] Identification

of cytotoxic compounds contributed to the development of anticancer therapeutics. Plant-based traditional medicine has played a major role in the therapy of a spectrum of diseases including cancer, and most of the

researchers are giving attention to natural products.^[6] To date, natural products are the most prolific source of biologically active compounds and play important role in the drug discovery and development.

Barringtonia racemosa, locally known as putat sungai in Malaysia, is a rich source of phytochemistry. In this region, the fruit and seed are used to treat asthma, cough, abscess, ulcer, and diarrhea.^[7] Quantitative phytochemical analysis of ethanolic extracts of *B. racemosa* aerial parts have showed higher content of total flavonoids.^[8] *Hibiscus sabdariffa* known as roselle is an annual shrub commonly used to make jellies, jams, and beverages. The dried flower of *H. sabdariffa* extract has shown high levels of polyphenol, flavonoid, and anthocyanin which was observed to be associated with anticancer effects.^[9]

Despite a few isolation works done on selected part of the plants, data on antioxidant potential of fruit part of the *B. racemosa* are still lacking. Information on antioxidant and cytotoxic activity of the plant extract worked potentially shed light on mechanism related to bioactive(s) of the plant. In this study, a Malaysian local tropical plant *B. racemosa* had been selected to identify for its antioxidant and anticancer activity as well as to compare the antioxidant capacity and cytotoxicity effect with a selected top source of antioxidant of local plant, *H. sabdariffa*.

MATERIALS AND METHODS

Chemicals

2,2'-diphenyl-1-picrylhydrazyl radical (DPPH), Folin-Ciocalteu phenol reagent, sodium carbonate (Na_2CO_3), β -carotene, linoleic acid, Tween 40, sodium nitrite (NaNO_2), aluminum chloride (AlCl_3), sodium hydroxide, ascorbic acid, gallic acid, and quercetin were obtained from Sigma-Aldrich (Sigma Chemical Co., St Louis, MO, USA). All the chemicals were of analytical grade.

Preparation of plant extracts

The whole fruits of *B. racemosa* and *H. sabdariffa* were collected from Permatang Pauh, Pulau Pinang, Malaysia. The fruits were cleaned and separated from the seed. The fruits were dried in an oven, at an average temperature of 40°C. Then, the fruits were grounded into powders. Dried powder of *B. racemosa* and *H. sabdariffa* fruits, respectively, was macerated with methanol at a ratio of dry weight:solvent of 1:10 (w/v). The extracts were filtered and evaporated on rotary evaporator to yield a crude residue. The crude extracts were stored in refrigerator and were evaluated for total phenolic content (TPC), total flavonoid content (TFC) as well as antioxidants activity.

Determination of total phenolic content

The TPC was measured using Folin-Ciocalteu's reagent according to the literature with some modifications.^[10] Briefly, 0.1 mL extracts (1 mg/mL) was mixed with 1.0 mL Foline-Ciocalteu phenol reagent and allowed to react for 3 min. Then, 300 μL of 1N Na_2CO_3 was added and incubated at room temperature for 90 min. Gallic acid (0.02–0.64 mg/mL) was used as standard. Absorbance was measured at 725 nm using Thermo Scientific™ Multiskan™ GO Microplate spectrophotometer. TPC of the extracts were determined from the standard calibration graph of absorbance versus concentration. The results were expressed as mg gallic acid equivalents (GAE) in 1 g of sample (mg GAE/g).

Determination of total flavonoid content

The TFC of the extracts was measured using colorimetric method with some modifications based on the stable formation of a flavonoid aluminum complex.^[11] Briefly, 250 μL of extracts (1 mg/mL) were mixed with 1.25 mL of distilled water and 75 μL of 5% NaNO_2

solution. After 6 min, 150 μL of 10% AlCl_3 was added, and the mixture was allowed to stand for a further 5 min. Then, 0.5 mL of 1 M sodium hydroxide (NaOH) and 275 μL distilled water were added to the mixture. Quercetin (0.02–0.64 mg/mL) was used as standard. Absorbance was measured at λ_{max} 510 nm using a Thermo Scientific™ Multiskan™ GO Microplate spectrophotometer. TFCs of the extracts were determined from the standard calibration graph of absorbance versus concentration. The results were expressed as mg quercetin equivalents in 1 g of sample (mg quercetin equivalents [QE]/g).

2,2'-diphenyl-1-picrylhydrazyl radical scavenging assay

The free radical scavenging activity was evaluated to look at the oxidation ability of the plant extracts toward the free radical DPPH. Experiments were carried out according to the literature with some modifications.^[12] Briefly, 200 μL of extract solution with different concentrations (1.953–1000 $\mu\text{g}/\text{mL}$) was loaded in 96-well plate. DPPH in absolute methanol (50 μL , 1 mM) was added into wells. The reaction mixture was shaken well and incubated for 30 min at room temperature in the dark. The absorbance of the resulting solution was recorded at 517 nm. The test was performed in triplicate. The inhibition percentage (I%) of DPPH was calculated according to the following equation:

$$\text{IC} (\%) = (A_0 - A_1)/A_0 \times 100$$

Where, IC (%) is a I% of DPPH radical. A_0 is the absorbance of a blank that was prepared in the same conditions, but without sample, and A_1 is the absorbance of test samples. Ascorbic acid was used as a positive control. A lower inhibitory concentration (IC_{50}) value indicates greater antioxidant activity.

β -carotene-linoleic acid bleaching assay

The antioxidant activities of the extracts were determined using the β -carotene-linoleic acid bleaching assay according to the literature with some modifications.^[13,14] A stock solution of β -carotene-linoleic acid was prepared by mixing 1 mL of chloroform with 0.5 mg β -carotene, 25 μL linoleic acid, and 200 mg Tween 40 into round bottom flask. The mixture was then evaporated at 40°C for 10 min by rotary evaporator to remove chloroform and immediately diluted with 100 mL of distilled water. The water was added to the mixture with vigorous shaking to form an emulsion. Then, 2.5 mL emulsion and 350 μL extracts (1 mg/mL) were added. The system was incubated in hot water bath at 45°C for 1 h. The absorbance of the samples, standard, and control was measured at 470 nm using a Thermo Scientific™ Multiskan™ GO Microplate spectrophotometer against a blank, consisting of an emulsion without β -carotene. The measurement was carried out at initial time ($t = 0$) and successively at 15 min intervals for 120 min. All samples were assayed in triplicate. I% of the samples was calculated using following equation:

$$\text{I} (\%) = (A_1/A_0) \times 100$$

Where, A_1 is the absorbance of β -carotene after 1 h assay remaining in the samples and A_0 is the absorbance of β -carotene at beginning of the experiments. Ascorbic acid was used as a positive control. A higher I% value indicates greater antioxidant activity.

Anticancer activity assay

Cell culture

The human breast cancer cell lines (MCF-7) were maintained in Dulbecco's modified eagle medium supplemented with 10% heat inactivated fetal bovine serum, streptomycin (100 $\mu\text{g}/\text{mL}$), and penicillin (100 $\mu\text{g}/\text{mL}$) in culture flask at 37°C in 5% CO_2 incubator. Subculture will be performed every 3 days.

Cytotoxic activity by 3-(4, 5-dimethylthiazol-2-yl)-2, 5-diphenyl tetrazolium bromide assay

The 3-(4, 5-dimethylthiazol-2-yl)-2, 5-diphenyl tetrazolium bromide (MTT) assay on crude extracts was carried out according to the method developed by^[15] with slight modifications using MCF-7. The carcinoma cells were seeded in a 96-well plate and incubated for 24 h. After 24 h, 100 µl of medium containing extracts with various concentrations (200 µg/mL, 100 µg/mL, 50 µg/mL, 25 µg/mL, 12.5 µg/mL, and 6.25 µg/mL) were added into 96-well plates and further incubated for 48 h. A positive control (tamoxifen), blank (medium only), and negative control (cell with medium only) were included. Then, 24 µl of 5 mg/mL MTT reagent was added to each well and incubated for another 4 h. After that, medium was aspirated and 100 µl of DMSO was added to each well. After 10 min incubation, the absorbance was measured at 570 nm using a Thermo Scientific™ Multiskan™ GO Microplate spectrophotometer. I% of the cells were calculated using following equation.

$$IC\ (\%) = (1 - [A_1 - A_0] / [A_1 - A_0]) \times 100$$

Where, (IC) (%) is a I% of the cells. A_1 is the absorbance of test samples, A_0 is the absorbance of a blank and A_1 is the absorbance of a negative control. Tamoxifen was used as a positive control. A lower IC_{50} value indicates greater anticancer activity.

Statistical analysis

All experiments were carried out in triplicates and results are expressed as means ± standard error mean. Data were analyzed using one-way analysis of variance and differences were considered significant at $P < 0.05$. The IC_{50} were determined by statistical software, GraphPad Software, Inc. Version 5.00.

RESULTS

Determination of total phenolic and total flavonoid content

Phytochemical screening of total phenolic and TFC revealed the presence of phenolic and flavonoid compounds in *B. racemosa* and *H. sabdariffa* methanol fruit extracts. The results of total phenolic and TFC assay are as shown in Table 1. In the assay, *B. racemosa* demonstrated highest TPC (14.70 ± 1.05 mg GAE/g) and TFC (130 ± 1.18 mg QE/g) compared to *H. sabdariffa* (3.80 ± 2.13 mg GAE/g and 40.75 ± 1.15 mg QE/g), respectively.

2,2'-diphenyl-1-picrylhydrazyl radical scavenging assay and β-carotene-linoleic acid bleaching assay

The methanol fruit extracts of *B. racemosa* and *H. sabdariffa* were tested for their antioxidant activity using DPPH and β-carotene-linoleic acid bleaching assay [Table 2]. The *B. racemosa* fruit extract was found to possess higher DPPH free radical scavenging activity at lowest concentration (IC_{50} 15.26 ± 1.25 µg/mL) compared to *H. sabdariffa* (IC_{50} 124.3 ± 1.89 µg/mL). This can be seen by determining the inhibition concentration (IC_{50}) values of these two extract compared with standard ascorbic acid (7.86 ± 1.87 µg/mL). In β-carotene-linoleic acid bleaching assay, the highest percentage of inhibition was shown by *B. racemosa* fruit extract at 98.13 ± 1.83% followed by *H. sabdariffa* at 94.86 ± 2.11%.

Anticancer activity assay

The cytotoxic effects of crude methanol extract of *B. racemosa* and *H. sabdariffa* on the growth of breast cancer cell line (MCF-7), as well as

tamoxifen as positive control were investigated using the MTT assay and summarized in Table 3. Interestingly, the *in vitro* screening of *B. racemosa* fruit methanol extract showed potential cytotoxic activity against MCF-7 cell line compared to *H. sabdariffa*. The IC_{50} value obtained for *B. racemosa* was 42.63 µg/mL. This can be seen by determining the IC_{50} values of these two extracts compared with standard ascorbic acid (7.86 µg/mL).

DISCUSSION

B. racemosa fruit has been consumed in Malaysia villages as traditional salad and it is interesting to discover that the flavonoid content was higher at almost 10 times compared to its phenolic content. This study concurred with previous finding which found phenolic and flavonoids as the major antioxidant components of the *B. racemosa* leaf, stick, and bark extracts.^[8] *H. sabdariffa* methanol fruit extract in this study had showed a slightly high value of TPC compared with previous study on its methanol extract of seed, fruit, leaf, and stem methanol extract of the same species.^[16] The TFC values also showed higher flavonoid content from a previous similar study.^[17] The slight differences may be due to the geographical areas, state of maturity of sample sources, and method of sample preparation.^[18]

The observed result in Table 2 reveal that *B. racemosa* possess antioxidant properties, since the extract showed potent low IC_{50} value (15.26 ± 1.25 µg/mL) in DPPH assay and high percentage of inhibition (98.13 ± 1.83%) in β-carotene linoleic acid bleaching assay. This activity could be due to the presence of phenolic and flavonoid compounds, as found by previous studies done on aerial part of the

plant.^[8] Of interest, the quercetin 3-O-rutinoside is known to be present in the methanol extract of *B. racemosa* fruit isolation work.^[19] Luo *et al.* in 2002 have established how the contribution of total antioxidant activity of many fruits and vegetables was related to their flavonoid and polyphenols contents.^[20] Several other reports have also demonstrated a close relationship between total phenolic and flavonoid content and high antioxidant activity.^[21,22] This present study exposed that fruit of *B. racemosa* could be a good source of natural antioxidants due to it being rich in flavonoid and phenolic content. *B. racemosa* can be an interesting source of antioxidant bioactive, with potential uses in many industries such as food, cosmetics, nutraceutical, and pharmaceutical. These quantitative analyses of antioxidant activity are in support of the relationship between total antioxidant capacity and phytochemical content of plant extract of this species.

Consequently, in the last few years, the identification and development of natural product-based drug has become a major area in cancer research. In fact, approximately, 74% of anticancer drugs developed today originated from medicinal plants.^[23] The fruit of *B. racemosa* are studied for the first time for their cytotoxic activities except for *H. sabdariffa*. Interestingly, in this study, a local plant *B. racemosa* fruit methanol extract showed potential cytotoxic activity (IC₅₀ 57.61 ± 2.24 µg/mL) against MCF-7 cell line. The cytotoxic activity in MCF-7 cell line may be due to the presence of phytochemicals content in extract. Several reports indicated that flavonoid contributed to programmed cell death mechanism by activating caspases pathway.^[24] The combination of both alkaloids with flavonoids in *ononis hirta* (aerial parts) extract was also has shown superior activity against MCF-7 cell line.^[25] This result of our observed cytotoxicity is in accordance with the phytochemical finding which showed the presence of flavonoids and alkaloid in plant extracts [Table 1]. This study was comparable to the previous finding that was found on the seed extract of *B. racemosa* which exhibited promising anti Dalton's lymphoma ascitic in mice.^[26] Previously, ethanol extract of *B. racemosa* leaves have also displayed cytotoxicity against the human cervical carcinoma cell (IC₅₀ 10 g/mL).^[27]

CONCLUSION

Methanol fruit extracts of *B. racemosa* and *H. sabdariffa* exhibited varying degrees of total phenolic and flavonoid contents and antioxidant activity. The present study indicated that both phenolic and flavonoid compounds, known capable of oxidizing activities, play an important role in the antioxidant capability of these two plant species. Following this finding, further study is underway to identify important phytochemical bioactives for further development of this plant in nutraceutical and pharmaceutical use.
