Specific Armadillo repeat sequences facilitate β -catenin nuclear transport in live cells via direct binding to nucleoporins Nup62, Nup153, and RanBP2/Nup358.

Manisha Sharma, Cara Jamieson, Michael Johnson, Mark P. Molloy, and Beric R. Henderson

This article has been withdrawn by the authors. Further analysis revealed that the published data in Fig. 3C describing the binding of the R3–8 Arm fragment of β -catenin to Nup62 were in error. In addition, several lanes of the immunoblots in Fig. 3 were spliced together for presentation without clear indication of this fact.

Authors are urged to introduce these corrections into any reprints they distribute. Secondary (abstract) services are urged to carry notice of these corrections as prominently as they carried the original abstracts.
