

ERRATUM

The authors of “The *IGF2* mRNA binding protein p62/IGF2BP2-2 induces fatty acid elongation as a critical feature of steatosis” (*J. Lipid Res.* 2014, 55: 1087–1097) have informed the *Journal* that there were several errors in this article. In Fig. 3B (left), the FASN immunoblot was inadvertently duplicated in the tubulin panel. The FASN quantification data were normalized to the correct tubulin data, so this error does not affect the fold change of FASN with p62 knockdown in HepG2 cells. The correct tubulin blot is now shown. In Figs. 1G and 3C, the p62 bands for wt animals were misaligned during figure preparation. Additionally, the borders between different sections of the same immunoblot are now indicated with a dividing line. These corrections do not affect the results or interpretations of this work.
