ABSTRACT *Salmonella* is a common food-associated bacterium that has substantial impact on worldwide human health and the global economy. This is the public release of 1,183 *Salmonella* draft genome sequences as part of the 100K Pathogen Genome Project. These isolates represent global genomic diversity in the *Salmonella* genus.

The *Salmonella* genus includes two species, *Salmonella bongori* and *Salmonella enterica*, that are subdivided into >2,500 serovars (1, 2). This organism is a persistent causative agent of gastroenteritis in humans, is carried by livestock, and is one of the most important food pathogens globally (3). Transmission occurs through the ingestion of contaminated food products, resulting in an estimated 1.4 to 1.6 million cases of salmonellosis in the United States, with an estimated cost of \$2.3 billion and with ~1.5 billion cases worldwide yearly (4, 5), which results in ~1,000 deaths (6). Control strategies include increased surveillance, biocontrol, hygiene interventions, animal vaccination, and antibiotics (7), which are often used in combination with limited success to control outbreaks among humans. The common occurrence of *Salmonella* in the global food chain, combined with rapid genome evolution (8), leads to the emergence of hypervirulent and antibiotic-resistant isolates, suggesting that the genetic diversity of these organisms is circumventing current control strategies (4, 9, 10).

The 100K Pathogen Genome Project (<http://www.100kgenomes.org>) is a large-scale sequencing project focused on producing genomes from a worldwide consortium that represents pathogenic bacteria from the environment, plants, animals, and humans. The consortium sequenced animal- and human health-associated pathogens for use in a reference database. In this release, we sequenced *Salmonella* genomes from around the world and multiple isolation sources to better understand the genomic diversity of the genus.

All cultures from the 100K Pathogen Genome Project were collected and banked in the laboratory of Bart C. Weimer (University of California, Davis, Davis, CA). The isolates were checked for purity and stored in cryotubes. Genomic DNA was extracted from cultures grown on 1.5% Luria-Bertani agar (Difco, Franklin Lakes, NJ), lysed (11), purified with a Qiagen QIAamp DNA genomic minikit (catalog no. 51306) (12), and checked for quality (13) before fragmentation (14). Genomic DNA was fragmented using a Diagenode Biorupter or Covaris E220, and 1 μ g was used for library construction with the Kapa high-throughput (HTP) library preparation kit with dual-SPRI size selection (catalog no. KK8234; Kapa Biosystems, Boston, MA) using the Agilent Bravo next-generation sequencing (NGS) workstation (Santa Clara, CA) with barcodes from Bioo Scientific

NEXTflex-96 or Integrated DNA Technologies, Inc. Weimer384-TS-LT (15, 16). Producing libraries with 250- to 500-bp fragments, library amplification was done for eight cycles using the Kapa HiFi HotStart ReadyMix, followed by 1× SPRI bead cleanup. Library size was confirmed using the Agilent 2100 Bioanalyzer with the high-sensitivity DNA kit and indexed (96 genomes/lane). Indexed libraries were quantified with Kapa library quantification (catalog no. KK4824) prior to pooling, followed by sequencing on the Illumina HiSeq 2000 with PE100 (BGI@UCDavis, Sacramento, CA). Paired-end reads were assembled using SPAdes version 3.9.0 (17). In this release, the 100K Pathogen Genome Project has produced sequences for 1,183 different *Salmonella* isolates.

Accession number(s). The sequences are publicly available at the 100K Project BioProject (PRJNA186441) and the NCBI GenBank accession numbers are presented in Table 1.

ACKNOWLEDGMENTS

We thank Lucy Cai, Alvin Leonardo, Patrick Ancheta, Regina Agulto, Vivian Lee, Christina Kong, Kendra Liu, Derek Yip, Phong Nguy, and Vanessa Young for their technical assistance. Also, we gratefully acknowledge those who submitted isolates and provided funding for this project that includes funding to B.C.W. from the Agilent Thought Leader Award.
