Abstract

Parasitic diseases continue to represent a threat on a global scale, particularly among the poorest countries in the world. This is particularly because of the absence of vaccines, and in some cases, resistance against available drugs, currently being used for their treatment. In this review emphasis is laid on natural products and scaffolds from African medicinal plants (AMPs) for lead drug discovery and possible further development of drugs for the treatment of parasitic diseases. In the discussion, emphasis has been laid on alkaloids, terpenoids, quinones, flavonoids and narrower compound classes of compounds with micromolar range activities against *Schistosoma*, *Trypanosoma* and *Leishmania* species. In each subparagraph, emphasis is laid on the compound subclasses with most promising in vitro and/or in vivo activities of plant extracts and isolated compounds. Suggestions for future drug development from African medicinal plants have also been provided. This review covering 167 references, including 82 compounds, provides information published within two decades (1997–2017).

1 Introduction

Parasites are considered as organisms that obtain their food by eating other organisms or their products in nature. These diseases continue to be a cause of considerable morbidity and mortality globally [1–4], including Trypanosomiasis (African sleeping sickness and Chagas disease) [5–7], Leishmaniasis [8] and Schistosomiasis [9, 10]. They threaten almost one-third of the world's population, the most numerous incidents being recorded in over 100 tropical and developing countries and territories, Fig. 1 [11–13]. The African region recorded the most death-related cases, especially amongst infants below the age of 5 and pregnant women. Schistosomiasis, caused by parasites of the *Schistosoma* genus are responsible for about 200 million sickness cases and about 280,000 death-related incidents annually worldwide [9, 10, 14]. Only one drug (praziquantel) has been proven to be effective in the treatment of human Schistosomiasis, with no vaccine available or in development so far [15–21]. Serious concerns about drug selectivity and resistance were raised in 2013 when over 30 million people were treated in Sub-Saharan Africa [20]. Moreover, observed resistance and reduced efficiency of praziquantel in laboratory strains have prompted the search for alternative therapeutic strategies [20–27].

Trypanosomiasis, which represents several diseases caused by parasites of the genus *Trypanosoma*, is also of interest [5, 27–29]. This disease, which is much arguably the most important disease of man and domesticated animals, accounts for over 8 million reported annual cases globally, especially in the tropical regions of Latin America and Africa [30, 31]. Besides, great socioeconomic effects on the endemic areas by this disease are forecast if inadequate attention (both at the communal, national, and international levels) is not given [7, 29, 32–34]. Leishmaniasis is caused by parasites of the *Leishmania* type, which is also transmitted by certain types of sandflies [35, 36]. The diseases are reported by the WHO to be responsible for about 1 million new cases leading to approximately 30,000 deaths annually on a global scale. The major cause is

Fig. 1 Global statistics for disease burdens in 2017

linked to environmental changes and affects mainly the very poor populations [37, 38]. These three diseases represent a real burden to the lives of millions of persons and their domesticated animals. The trio is capable of inflicting long-term disability and social stigmatisation, which can ultimately lead to a highly unproductive population and eventually result in economic loss and the slowdown of a country's development.

With the absence of any vaccine targeting any parasites and resistance against the already existing anti-parasitic drugs, research efforts have been employed and encouraged towards the search for new, cheaper, potent and effective drugs to treat these diseases. Medicinal plants represent a potential source of new drugs. This is because natural products (NPs) from organisms such as animals, fungi and the higher plants have been known to be good sources of pharmacologically active compounds against several ailments, including parasitic infections. Moreover, NPs are believed to have significant advantages as lead molecules over synthetic molecules [39–49]. The criteria for choosing a particular natural product for studies are either based on the pre-existing knowledge on the traditional use of the source species in therapy (ethnobotanical knowledge) or the search for structurally related molecules with known pharmacologically active agents from chemical databases [49–54]. The African continent is highly diverse ethnobotanically. This might explain why about 80% of the population tends to rely on medicinal plants as a primary source of healthcare [55–67]. It is our goal to provide evidence of the efficacy and potency of plants used in traditional medicine against parasitic infections. The systematic documentation of the plant-based chemical constituents of African traditional medicine and attempting to using in silico procedures to investigate their modes of action are ongoing efforts [44–46, 52, 53], particularly on the isolated compounds from African medicinal plants (AMPs) with evaluated in vitro and/or in vivo activities against Trypanosomiasis [68–74], Schistosomiasis, Leishmaniasis [72–74] and other parasitic diseases [4]. However, the most recent review dates about 3 years back and was focused only on plants collected from Nigeria. Thus, an updated review that covers the entire continent for these three parasitic diseases is required now. The information presented herein was retrieved by searching literature from major international journals on natural products and medicinal chemistry, alongside available M.Sc. and Ph.D. theses and online databases [54, 75]. The information gathered is discussed under the main compound classes, as presented below and summarised in Tables 1, 2, and 3.

Table 1 Bioactive alkaloids from African flora with potential for antitrypanosomal and antileishmanial drug discovery

Compound number	Compound class/subclass	Part of plant studied	Species name	Plant family	Place of collection	Used traditionally/ locally	Reported activity on/against	References
1–5	Alkaloid/ Naphthylisoquinoline	Leaves	<i>Ancistrocladus tanzaniensis</i>	Asteraceae (Compositae)	Uzungwa Mountains, Tanzania	Different species of <i>Ancistrocladus</i> are used as a diuretic; also for the treatment of malaria, dysentery, elephantiasis, febrile and phlogistic.	Trypanosomiasis and leishmanosomiasis	[85, 86]
6, 7		Leaves, stem bark and roots	<i>Ancistrocladus ealaensis</i>	Asteraceae (Compositae)	Eala, Democratic Republic of Congo		Trypanosomiasis and leishmanosomiasis	[87]
8–11		Stem and root bark	<i>Ancistrocladus congolensis</i>	Asteraceae (Compositae)	Yandja-Rive, Democratic Republic of Congo		Trypanosomiasis	[88]
12–14		Leaves	<i>Ancistrocladus species</i>	Asteraceae (Compositae)	Ikela, Democratic Republic of Congo		Trypanosomiasis and leishmanosomiasis	[89]
15		Roots	<i>Ancistrocladus likoko</i>	Asteraceae (Compositae)	Yangambi, Democratic Republic of Congo		Trypanosomiasis and leishmanosomiasis	[90]
16		Roots	<i>Dioncophyllum thollonii</i>	Dioncophyllaceae	Rabi Kounga, Gabon	For treatment of malaria, Leishmaniasis, dysentery and elephantiasis	Trypanosomiasis and leishmanosomiasis	[91]
17, 18	Alkaloid/Aporphine	Aerial parts	<i>Cassynia filiformis</i>	Lauraceae	Sèmè, Ouémé, Benin	To treat cancer, African Trypanosomiasis and other diseases	Trypanosomiasis (IC ₅₀ = 10.29 and 17.60 µM, respectively)	[92]
19–28	Alkaloid/Quinoline	Roots	<i>Waltheria indica</i>	Malvaceae	Inder, Niger	To treat cough, fever, external haemorrhage, dysentery, toothache, malaria, eye drop	Trypanosomiasis (IC ₅₀ for 26 = 3.1 µM)	[93]
29–33	Alkaloid/Indoles and others	Stem bark	<i>Polyalthia suaveolens</i>	Annonaceae	Yaoundé, Cameroon	To treat rheumatic pains	Trypanosomiasis (IC ₅₀ for 31–0.5 µM)	[94]

Table 2 Bioactive terpenoids from African flora with potential for antitrypanosomal anti-*Schistosoma* and antileishmanial drug discovery

Compound number	Compound class/subclass	Part of plant studied	Species name	Plant family	Place of collection	Used traditionally/locally	Reported activity on/against	References
34–38	Terpenoid/ Sesquiterpenoids	Stem bark	<i>Warburgia ugandensis</i>	Canellaceae	Harena Forest, Dello Menna, Ethiopia	Treatment of various ailments such as common cold, fever, malaria, stomachache, constipation snakebites measles and diarrheal. This plant is also a common component in a number of medicinal preparations.	Trypanosomiasis (IC ₅₀ from 0.64 to 6.4 μM)	[115]
39–41	Terpenoid/ Carvotacetone derivatives	Aerial parts	<i>Sphaeranthus bullatus</i> (syn: <i>S. gallensis</i> <i>Sacleux</i>)	Asteraceae	Ngong forest, Nairobi, Kenya	Usually consumed as herbal tea for the management of diarrheal.	Leishmanosomiasis (IC ₅₀ = 2.16, 10.64 and 2.89 μM, respectively)	[118]
42, 43	Terpenoid	Roots	<i>Clerodendrum eriophyllum</i>	Verbenaceae	Machakos, Eastern Kenya	Treatment of malaria	Leishmanosomiasis (IC ₅₀ = 0.25 and 0.61 μM, respectively)	[121]
44–46	Terpenoid/ Diterpenoid	Leaves	<i>Polyalthia longifolia</i>	Annonaceae	Anyigba, Kogi State, Nigeria	To treat various protozoan infections including species of <i>Trypanosoma</i> , <i>Leishmania</i> , and <i>Plasmodium</i>	Trypanosomiasis	[122]
47		Leaves	<i>Eucalyptus maculata</i>	Myrtaceae	Anyigba, Kogi State, Nigeria	To treat various protozoan infections including species of <i>Trypanosoma</i> , <i>Leishmania</i> , and <i>Plasmodium</i>	Trypanosomiasis	[122]
48	Terpenoid/ Diterpenoid	Bark	<i>Entada abyssinica</i>	Fabaceae	Dschang, Cameroon	To treat sleeping sickness	Trypanosomiasis (IC ₅₀ = 12 μM)	[124]
49–51	Terpenoid/ Diterpenoid	Fruits	<i>Xylopiya aethiopica</i>	Annonaceae	Nkongsamba, Cameroon	To treat bronchitis and dysenteric among other ailments	Trypanosomiasis	[126]
52	Terpenoid/ Diterpenoid	Rhizomes	<i>Aframomum sceptrum</i>	Zingiberaceae	Ivory Coast	In addition to their spiritual belief from the plant species, they are as well used as food spice, and for the treatment of inflammation, eczema, fevers, laxative, anti-helminthic, mumps, etc.	Trypanosomiasis and leishmanosomiasis (IC ₅₀ = 5.7 μM).	[127]

Table 2 (continued)

Compound number	Compound class/subclass	Part of plant studied	Species name	Plant family	Place of collection	Used traditionally/locally	Reported activity on/against	References
53	Terpenoid/ Triterpenoid	Roots	<i>Asparagus stipularis</i>	Asparagaceae	Simai, Egypt	To treat Schistosomiasis (bilharziasis) amongst other ailments	Schistosomiasis	[128]
54	Terpenoid/ Diterpenoid	Root barks	<i>Elaeodendron schlechteranum</i>	Celastraceae	Bunda district, Kung'ombe, Tanzania	Treatment of anaemia, general body pain, dysmenorrhea, female infertility and male impotence, boils, carbuncles, cardiovascular problems including hypertension and joint inflammation.	Trypanosomiasis (<i>T. cruzi</i> ($IC_{50} < 0.57 \mu M$), <i>T. brucei</i> ($IC_{50} < 0.57 \mu M$) and leishmanosomiasis against (<i>L. infantum</i> $IC_{50} = 1.67 \mu M$))	[129]
55, 56		Roots	<i>Salacia madagascariensis</i>	Celastraceae	Tanzania	Treat malaria, fever, and menorrhagia	Leishmanosomiasis	[130]
57, 58	Terpenoid/ Diterpenoid and Triterpenoid	Leaves	<i>Keetia leucantha</i> (syn: <i>Plectronia leucantha Krause</i>)	Rubiaceae	Benin	To treat parasitic diseases	Trypanosomiasis (IC_{50} for 57 = 5.48 and 14.25 μM , respectively, on <i>Tbb</i> BSF and <i>Tbb</i> PF. IC_{50} for 58 = 16.00 μM on <i>Tbb</i> BSF)	[131]
59	Terpenoid/ Diterpenoid	Stem bark	<i>Piptostigma preussi</i>	Annonaceae	Ebolowa, Cameroon	To treat malaria	Trypanosomiasis activity	[132]
60, 61	Terpenoid/ Triterpenoid	Stem bark	<i>Vernonia guineensis</i>	Asteraceae (Compositae)	Bafoussam, Cameroon	To treat malaria and jaundice as well as an anthelmintic, an aphrodisiac and an antidote to poison	Trypanosomiasis (IC_{50} from 4.60 to 7.67 μM)	[133]

Table 3 Other bioactive compounds from African flora with potential for antitrypanosomal and antileishmanial drug discovery

Compound number	Compound class/subclass	Part of plant studied	Species name	Plant family	Place of collection	Used traditionally/locally	Reported activity on/ against	REFERENCES
62	Amide	Roots	<i>Zapoteca portoricensis</i>	Fabaceae	Nsukka, in Enugu State, Nigeria	In wound healing as well as the treatment of toothache, tonsillitis, against diarrhoea, and as an anticonvulsant and antispasmodic	Trypanosomiasis (IC ₅₀ = 3.63, 41.65 and 92.05 µM against <i>T. b. rhodesiense</i> , <i>T. cruzi</i> and L6 cells, respectively)	[143]
63, 64	Diarylheptanoid	Seeds	<i>Aframomum letestuanum</i>	Zingiberaceae	Abong-bang, Cameroon	In addition to their spiritual belief from the plant species, they are as well used as food spice, and for the treatment of inflammation, eczema, fevers, laxative, anti-helminthic, mumps, etc.	Trypanosomiasis (IC ₅₀ = 4.49 and 8.39 µM, respectively)	[136]
65–68	Acylphloroglucinols	Fruits	<i>Allanblackia monticola</i>	Clusiaceae (Guttiferae)	Bazou, West Province, Cameroon	Treatment of certain human ailments such as respiratory infections, diarrhoea, toothache, pain, fever	Leishmanosomiasis (IC ₅₀ = 0.16, 0.33 and 0.2 µM, for 65 to 67, respectively)	[149]
69	Xanthone	Leaves	<i>Symphonia globulifera</i>	Clusiaceae (Guttiferae)	Bangangré, West Province, Cameroon	To treat malaria, stomach and skin aches. It is also used as laxative by pregnant women and as a general tonic	Leishmanosomiasis [149]	[149]
70–72	Taccalonolide	Tubers	<i>Tacca leontopetaloides</i>	Taccaceae	Benue State, Nigeria	tubers are also processed for food as well as to treat stomach disorders, gastric ulcers, tooth ache, high blood pressure, hepatitis, enteritis and sexual dysfunction	Trypanosomiasis [150]	[150]
73–75	Quinone/Anthrone	Leaf latex	<i>Aloe calidophila</i>	Asphodelaceae	Yabello and Mega, Ethiopia	To treat sexually transmitted infections, digestive disorder, dermatological ailments, ophthalmia, conjunctivitis, wounds, burns, other injuries, etc.	Leishmanosomiasis (IC ₅₀ from 3.12 to 15.26 µM)	[151]
76, 77	Quinone/Naphthoquinone	Seeds	<i>Triphyophyllum peltatum</i>	Dioncophyllaceae	Parc de Tai, Ivory Coast	For treatment of malaria, dysentery and elephantiasis	Leishmanosomiasis [152]	[152]

Table 3 (continued)

Compound number	Compound class/subclass	Part of plant studied	Species name	Plant family	Place of collection	Used traditionally/locally	Reported activity on/ against	REFERENCES
78	Lactone	Stems	<i>Uvaria klaineana</i>	Annonaceae	Forêt des Abeilles, Gabon	For treatment of skin diseases, parasitic infections	Leishmaniasis (IC ₅₀ = 1.75 and 3.12 µM, respectively, against sensitive and amphotericin B-resistant promastigote forms of <i>L. donovani</i>)	[153]
79	Flavonoid	Leaves	<i>Vitex simplicifolia</i>	Verbenaceae	Nsukka, Nigeria	To treat edema, gout, malaria, skin diseases, toothache and dermatitis	Trypanosomiasis (IC ₅₀ = 4.7 µg/mL)	[154]
80		Aerial parts	<i>Ageratum conyzoides</i>	Asteraceae (Compositae)	Nile bank, Khartoum, Sudan	To treat leprosy, skin diseases, wound healing, mental headaches, dyspnea and infectious diseases. It is also used locally for its anti-asthmatic, antispasmodic, haemostatic effects and as an oil lotion for purulent ophthalmia.	Trypanosomiasis (IC ₅₀ = 7.8 µM) and leishmaniasis (IC ₅₀ = 9.2 µM)	[155]
81, 82	Phytosterol	Stem bark	<i>Allexis cauliflora</i>	Violaceae	Ebolowa, Cameroon	To treat fever and syphilis	Trypanosomiasis	[156]

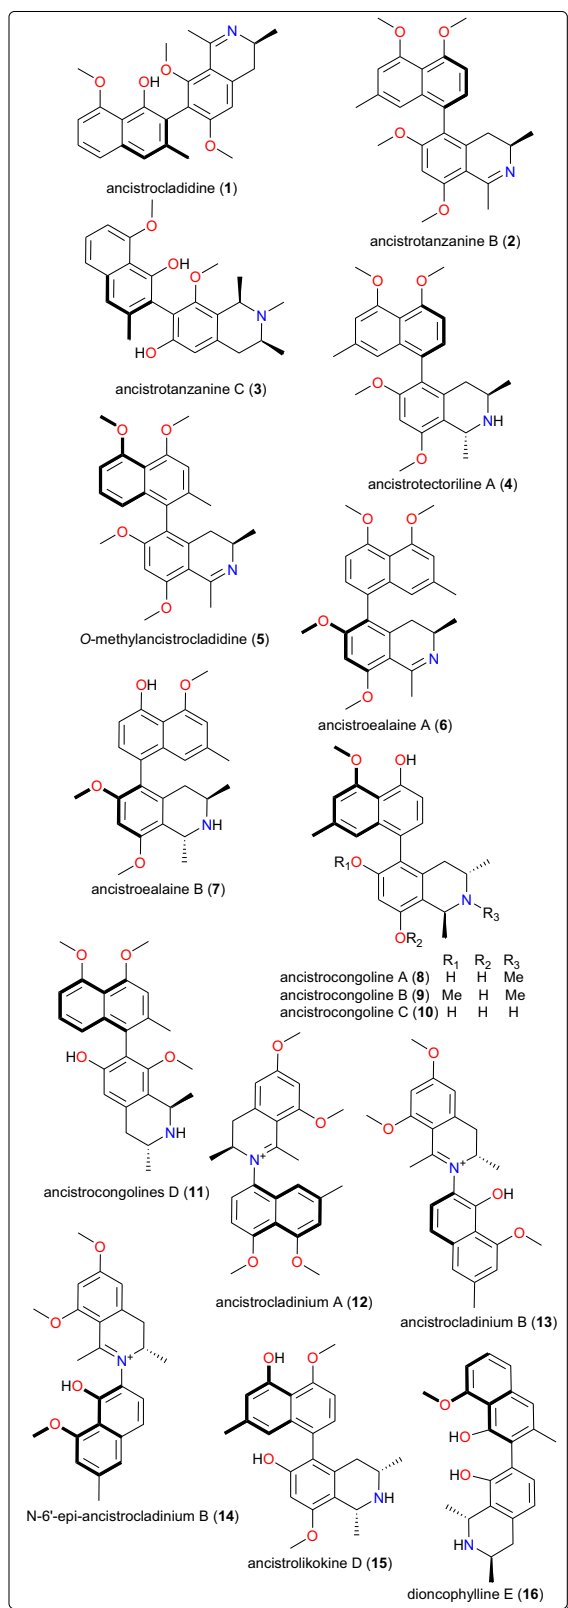

Fig. 2 Antiprotozoal naphthylisoquinoline alkaloids

Fig. 3 Aporphine alkaloids with trypanosidal potencies

2 Alkaloids

This class is characterized by nitrogen-containing compounds that are naturally occurring. Diverse species (fungi, plants, animals) have yielded several bioactive alkaloids against a broad range of diseases [76–84]. Table 1 summarises the alkaloids (compounds 1–33) isolated from AMPs and evaluated against these parasitic diseases, while Figs. 2, 3, 4 and 5 show a selection of some promising alkaloidal compounds, based on their evaluated activity (< 12.41 μM).

2.1 Naphthylisoquinolines

The leaves, stem bark and roots of *Ancistrocladus* sp. (Ancistrocladaceae) are known to be rich sources of naphthylisoquinoline alkaloids (Fig. 2) [85–91]. Ancistrocladidine (1), ancistrotananines B (2), and C (3), ancistroretoriline A (4), O-methylancistrocladidine (5), ancistroalaines A (6) and B (7), ancistrocongolines A–D (8–11), ancistrocladiniums A (12) and B (13), N-6'-epi-ancistrocladinium B (14), ancistolikokine D (15) and dioncophylline E (16) are few examples of naphthylisoquinoline antiparasitic alkaloids from *Ancistrocladus* sp. and *Dioncophyllum thollonii* (Dioncophyllaceae).

The evaluation of the biological activities of these compounds showed them to be a rare set and promising class of antiprotozoal and antiviral agents, which are only found in plants of the Ancistrocladaceae and Dioncophyllaceae, mostly found in Africa. Their anti-*Trypanosoma* activities are evident (e.g., with IC_{50} values ranging from 0.17 to 12.41 μM against *Trypanosoma brucei rhodesiense*), alongside good to moderate activities against *Trypanosoma cruzi* and *Leishmania donovani*. It might be worth mentioning that the isoquinoline scaffold has also been explored synthetically for the discovery of novel antiprotozoals and antimicrobials [85, 86, 95–97].

2.2 Aporphines

Other bioactive alkaloids include the aporphines (Fig. 3); actinodaphnine (17) and cassythine (18) from *Cassytha*

Fig. 4 Quinoline, indoles and other alkaloids showing activities against *Trypanosoma* species

filiformis (Lauraceae), a plant whose alkaloidal extract showed activity against *T. b. brucei* (with an IC₅₀ value of 2.2 μg/mL). This confirmed the use of this plant in African folkloric medicine to treat African Trypanosomiasis and other diseases [92, 98, 99]. The isolated compounds displayed antitrypanosomal activities, with IC₅₀ values of 10.29 and 17.60 μM for compounds 17 and 18, respectively. Although, the compounds showed low selectivity indices to HeLa cells (e.g., for actinodaphnine, IC₅₀ (HeLa)/IC₅₀ (*T. b. brucei*) < 5), when compared with the alkaloidal fraction (selectivity index = 16), they represent good starting scaffolds that could be optimised in order to

improve the efficacy and selectivity in the search for new bioactive molecules with trypanocidal effects.

2.3 Quinolines

Other trypanocidal alkaloids include the quinolines (Fig. 4); walthेरiones E–L (19–26), 8-deoxoantidesmone (27) and antidesmone (28) from *Waltheria indica* (Malvaceae) [93]. This plant is used in traditional medicine for the treatment of several ailments, including malaria [63, 100–104]. The dichloromethane root extract showed activities against *T. cruzi* (IC₅₀ = 0.74 μg/mL), *T. b. brucei* (2.3% survival at 20 μg/mL) and *T. b. rhodesiense* (IC₅₀ = 17.4 μg/mL) [93]. With the exception of walthेरione L (26), with a slightly higher IC₅₀ (3.1 μM), the isolated compounds all displayed potent growth inhibition toward the amastigote form of *T. cruzi* (the Tulahuén C4 strain), with IC₅₀ values lower than that of the reference drug benznidazole (IC₅₀ = 2.9 μM). Structure–activity relationships (SARs) provide suggestions that, a methoxy group, bound to the nitrogen atom is important for activity (e.g., as in compounds 22, 24 and 25). This group at this position increased the lethality of *T. cruzi*. Furthermore, the absolute configuration (5*R*) (as in compounds 23, 26, 27) seems to result in a decrease of activity, while the presence of an N-oxide function (as in compound 26) is detrimental for *T. cruzi* inhibitory activity (Fig. 5). Finally, a comparison of the IC₅₀ values of the isolated compounds against *T. brucei* sp. and *T. cruzi* highlighted selective toxicity towards the latter. This suggests that these molecules (or the walthेरione scaffold) is a potential starting point for new safe antitrypanocidal drug development, although antidesmone (28) has already been patented for its potential as an antiprotozoal drug since 2003 [93, 105, 106].

2.4 Indoles and Other Alkaloids

Polysin (29), an indolosesquiterpene alkaloid from *Polyalthia suaveolens* (Annonaceae), was isolated together with the known alkaloids (Fig. 4); greenwayodendrin-3-one (30), 3-*O*-acetyl greenwayodendrin (31), *N*-acetyl polyveoline (32) and polyveoline (33). These alkaloids have demonstrated interesting activities on selected glycolytic enzymes, e.g., phosphofructo kinase (PFK), glyceraldehyde-3-phosphate dehydrogenase (GAPDH) and aldolase [94]. Of particular interest are polysin (29) and 3-*O*-acetyl greenwayodendrin (31). Compound 29 acted as a competitive reversible inhibitor against *T. brucei* PFK (K_i = 10 μM), while compound 31 acted as a selective inhibitor of *T. brucei* aldolase (with IC₅₀ ~ 0.5 μM). Meanwhile, polyveoline (33) acted as a selective inhibitor of *T. brucei* PFK and is a mixed reversible inhibitor of *T. brucei* GAPDH. These compounds, therefore, represent a good

Fig. 5 SAR for *W. indica* compounds inhibiting *T. cruzi*, *T. b. brucei* and *T. b. rhodesiense*

starting point for the design of new selective and potent trypanosomal drugs.

3 Terpenoids

Terpenoids constitute a large and diverse class of naturally occurring secondary metabolites, with interesting physiological and pharmacological functions [44, 107–110]. Their main scaffolds occur as multicyclic structures, e.g., hemi-terpenoids (5 carbon atoms), monoterpenoids (10 carbon atoms), sesquiterpenoids (15 carbon atoms), diterpenoids (20 carbon atoms), sesterterpenoids (25 carbon atoms), triterpenoids (30 carbon atoms), tetraterpenoids (40 carbon atoms), and polyterpenoids (more than 40 carbon atoms), which are all primarily derived from the five-carbon isoprene units [45, 107]. Terpenoids have been proven to possess interesting pharmacological activities as seen in the summary presented in Table 2 (compounds 34–61) and their corresponding structures shown in Figs. 6, 7, 8, 9 and 10 [44, 111–114].

3.1 Sesquiterpenoids

The sesquiterpenoids (Fig. 6), muzigadiolide (34), muzigadiol (35), 6 α ,9 α -dihydroxy-4(13),7-coloratadiene-11,12-dial (36), mukaadial (37) and ugandensidial (38), from the East African medicinal plant *Warburgia ugandensis* (Canellaceae) have demonstrated anti-*Trypanosoma* activities [115]. The compounds displayed in vitro activities (with IC₅₀ values ranging from 0.64 to 6.4 μ M) against *T. b. rhodesiense*, the parasite responsible for African sleeping sickness. Compound 37 had previously been isolated from the same plant, also showing antitrypanocidal activity [116]. This plant (now regarded as an endangered species) has attracted many researchers because of its traditional use for the treatment of a variety of ailments, including malaria and diverse fevers [115–117]. SAR studies suggested that an additional dialdehyde functional group to the

sesquiterpene lactone backbone, together with a hydroxyl group attached to C-9 contribute to the activity of the compounds.

3.2 Carvotacetone Derivatives

The native tropical East African medicinal plant *Sphaeranthus bullatus* (synonym: *S. gallensis* Sacleux, Family: Asteraceae) has been the origin of several compounds (Fig. 7) [118–120], including the carvotacetone derivatives; 3-acetoxy-7-hydroxy-5-tigloyloxycarvotacetone (39), 3,7-dihydroxy-5-tigloyloxycarvotacetone (40) and 3-acetoxy-5,7-dihydroxycarvotacetone (41). Compounds 39–41 demonstrated antileishmanial activities, with IC₅₀ values of 2.16, 10.64 and 2.89 μ M, respectively, against the parasite *L. donovani* promastigotes.

3.3 Diterpenoids

Other terpenoids include the abietane diterpenoids, taxodione (42) and uncinatone (43), Fig. 8, from the roots of *Clerodendrum eriophyllum* (Verbenaceae) [121], which displayed potent antileishmanial activities (with IC₅₀ values of 0.25 and 0.61 μ M, respectively) against *L. donovani*. The activities of the crude extracts, e.g., the ethyl acetate extracts of *Newbouldia laevis* (Bignoniaceae) (EC₅₀ 4.2 μ g/mL) and *Eucalyptus maculata* (Myrtaceae) (EC₅₀ 12.3 μ g/mL) and the hexane extract of *Polyalthia longifolia* (Annonaceae) (EC₅₀ 2.4 μ g/mL) as well as their isolated active compounds (Fig. 8); 16- α -hydroxy-cleroda-3-13(-14)z-dien-15,16-olide (44), kolavenic acid (45),

Fig. 6 Sesquiterpenoids which have demonstrated anti-*Trypanosoma* activities

Fig. 7 Carvotacetones with potent antileishmanial activities

polyalthiadioic acid (46) and the triterpenoid 3 β ,13 β -dihydroxy-urs-11-en-28-oic acid (47) were observed against different trypanosomes strains (s427 WT, B48 and AQP2/3KO) [122]. While these pure compounds exhibited activities against the tested strains, with EC₅₀ values ranging from 1.16 to 40.46 μ M, it was remarkable that no toxicity towards Human Embryonic Kidney cells was observed even at concentrations up to 400 μ g/mL (1.31 μ M), thus suggesting new scaffolds to be further developed for the treatment of the wild-type and multi-drug resistant *T. brucei* [122, 123]. Also interesting is the kolavivic acid derivative; monomethyl ester-15-kolavivic acid (48) isolated from *Entada abyssinica* (Fabaceae) [124], which demonstrated interesting selective inhibitory activity (IC₅₀ value of 12 μ M) against *T. brucei* GAPDH [125].

Other bioactive diterpenoids include 15-oxo-*ent*-kaur-16-en-19-oic acid (49), 15 α -acetoxy-*ent*-kaur-16-en-19-oic acid or xylopic acid, (50) and 16,17-epoxy-15-oxo-*ent*-kauran-19-oic acid or xylopioxyde (51), from the fruits of *Xylopia aethiopica* (Annonaceae) [126]. These compounds and their synthetic epoxide analogues were screened on antitrypanosomal and cytotoxicity assays, showing that only the naturally-occurring compounds (49–51) displayed cytotoxic effects on the mammalian fibroblast cell line MRC-5 (with ED₅₀ values ranging from 22 to 121 μ M), as well as inhibitory effects on the growth of the bloodstream forms of *T. b. brucei* cells (strain 241) (ED₅₀ ranging from 27 to 205 μ M).

The genus *Aframomum* (Zingiberaceae), has been the source of the antitrypanosomal. Sceptumlabdalactone B (52, Fig. 9) was identified, from the rhizomes of *A. sceptum*, a plant locally used for the treatment of infectious diseases including human African Trypanosomiasis (sleeping sickness), together with sceptumlabdalactone A [127, 134–136]. The activity of compound 52 (with IC₅₀ value of 5.7 μ M) against *L. donovani* was comparable to that of reference drugs (IC₅₀ of 2.5 and 3.0 μ M for pentamidine and miltefosine respectively). Additionally, this molecule demonstrated selective activity for *L. donovani*, when compared with the activity against *T. b. brucei*.

Fig. 8 Diterpenoids and a triterpenoid with selective inhibitory activity against *T. brucei* GAPDH

3.4 Triterpenoids

The anti-schistosomal activity of Asparagalin A (53, Fig. 10), from the Egyptian medicinal plant *Asparagus*

glycolytic enzymes GAPDH and PFK (glycolytic pathway enzymes validated by WHO as good targets for the development of drugs against trypanosomiasis), with IC_{50} values of 650 and 180 μM , respectively. The glycolytic enzymes GAPDH are responsible for ATP production and have been reported to be vital for the survival of Trypanosomatids [141, 142]. From the stem bark of *Vernonia guineensis* (Asteraceae), vernoguinosterol (**60**) and vernoguinolide (**61**), exhibited interesting trypanocidal activity with IC_{50} values in the range 4.60–7.67 μM [133].

4 Other Compound Classes

Other compound classes from AMP with reported activities on Leishmaniasis and Trypanosomiasis are shown in Figs. 11, 12, 13, 14, and 15, while a summary of the reported molecules is given in Table 3 (compounds **62–82**).

4.1 Amides

Plants from the genus *Zapoteca* (Fabaceae) have been the origin of diverse compounds with antiprotozoal activities. These include the ester 2-(2-benzamido-3-phenylpropanamido)-3-phenylpropyl acetate (trivial names; saropeptide or aurantiamide acetate) (**62**) from *Z. portoricensis* (Fig. 11) [143]. The IC_{50} values of compound **62** were 3.63, 41.65 and 92.05 μM against *T. b. rhodesiense*, *T. cruzi* and against rat skeletal myoblast cell line (L6 cells), respectively. The compound had been previously reported to possess anti-inflammatory as well as antiplatelet aggregation activities, which are complementary to the observed trypanocidal property [144–148]. Since inflammation poses major problems in the advanced stages of Trypanosomiasis, compound **62** represents a promising natural hit with a reasonable selectivity for *T. b. rhodesiense*.

4.2 Diarylhepanoids

Other potent antitrypanosomal compounds are the diarylhepanoid; letestuianin C (**63**) and (4Z,6E)-5-hydroxy-1,7-bis(4-hydroxyphenyl)hepta-4,6-dien-3-one (**64**) from the species *Aframomum letestuianum*, Fig. 11 [136]. The activities of compounds **63** (4.49 μM) and **64** (8.39 μM) validate the use of the *Aframomum* sp. in treating parasitic ailments amongst others.

4.3 Acylphloroglucinols and Xanthones

Guttiferone A (**65**), garcinol (**66**), cambogin (**67**) and guttiferone F (**68**) from *Allanblackia monticola* (Guttiferae or Clusiaceae) fruits and xanthone V₁ (**69**) from *Symphonia globulifera* leaves have shown antileishmanial activities

Fig. 11 An antitrypanosomal amide and two diarylhepanoids

(Fig. 12) [149]. The compounds exhibited very potent in vitro antileishmanial activities, particularly compounds **65–67**, with IC_{50} values of 0.16, 0.33 and 0.2 μM , for compounds **65**, **66** and **67**, respectively. These were lower than that of the reference drug, miltefosine (0.46 μM). SAR studies could further improve the activities of these compounds in order to enhance their selectivity indices against human cancer cell lines.

4.4 Taccalonolides

Beside their proven anticancer potential, these represent a quite potent class of antitrypanosomal compounds identified from *Tacca leontopetaloides* (Taccaceae) [157–162]. These include taccalonolide A 12-propanoate (**70**), taccalonolide T (**71**) and taccalonolide S (**72**) from the tubers of *T. leontopetaloides* (Fig. 13). They have shown activities against the *T. b. brucei* s427 lister strain [150]. These compounds and crude fractions yielded EC_{50} values as low as 0.79 $\mu\text{g/mL}$.

4.5 Quinones and Klaivanolide

Quinones from *Aloe* species have also shown antileishmanial activities. These include aloinoside (**73**), aloin (**74**) and microdantin (**75**) from the leaf latex of *A. calidophila* (Fig. 14) [151]. It is noteworthy that, the activities of the most potent compounds, with IC_{50} values ranging from 3.12 to 10.92 μM against *Leishmania aethiopsica* and from

Fig. 12 Acylphloroglucinols and a xanthone with very potent *in vitro* antileishmanial activities in the nanomolar range

3.70 to 15.26 μM against *Leishmania major*, were comparable to the control drug amphotericin B ($\text{IC}_{50} = 0.12$ and 0.07 μM against *L. aethiopica* and *L. major* respectively). The selectivity indices of aloinoside (**73**) (813.35 and 694.90, respectively, against *L. aethiopica* and *L. major*) were much better than those of the control, amphotericin B (423.49 and 688.96, respectively). This suggests that the isolated compounds could serve as potential scaffolds for the development of safe, specific and cost-effective antileishmanial agents [151]. Additionally, the dioncoquinones A (**76**) and B (**77**) isolated from *Triphyophyllum peltatum* (Dioncophyllaceae) showed good and specific activity against *L. major* by inhibiting the growth of the parasite at very low concentrations [152]. Klaivanolide (**78**), from the stems of *Uvaria klaineana* (Annonaceae), was also reported as a potent molecule (*in vitro* IC_{50} values of 1.75 and 3.12 μM , respectively)

Fig. 13 Taccalonolides, a rare class of antiprotozoals

against sensitive and amphotericin B-resistant promastigote forms of *L. donovani* [153].

4.6 Flavonoids

Artemetin (**79**, Fig. 15), from *Vitex simplicifolia* (Verbenaceae) leaves, exhibited promising trypanocidal activity with an IC_{50} value of 4.7 $\mu\text{g}/\text{mL}$ and a selectivity index of 9.8 against L6 cells [154]. While this activity confirms the use of this plant in the traditional treatment of ailments including parasitic diseases [163–165], phytochemical evaluation of trypanocidal activities were not reported before. Hence, the plant could further be investigated for the unidentified compounds. An investigation of *Ageratum conyzoides* (Asteraceae), a plant known for its importance

perform in silico prediction of binding modes and binding free energy calculations of some of the compounds against some selected targets.
