**Background:** The roots and rhizomes of *Cimicifuga yunnanensis* Hsiao are commonly used as anti-inflammatory, antipyretic, and analgesic remedies and detoxification agents in traditional Chinese medicine (TCM). Although *C. yunnanensis* has been considered as supplementary medicine for several disorders, the antitumor effect of this herb and its key components has not been explored.

**Materials and methods:** The rhizomes of *C. yunnanensis* were isolated by chromatographic techniques. Structures of isolated compounds were identified based on spectroscopic methods and comparison with published data. The in vitro anticancer activities of purified components were also performed by MTT experiments. The in vivo anticancer activities were examined by subcutaneous tumor model or a breast cancer liver metastasis model.

**Results:** In this study, we aimed to identify and characterize the effective antitumor components from the rhizomes of *C. yunnanensis*. By bioassay-guided fractionation techniques and chemical characterization, 12 cycloartane triterpenes and four chromones were isolated, among them, 11 compounds were identified in this genus at first. The identified two compounds showed dramatic inhibitory activities against breast cancer cells: compound 4 (23-epi-26-deoxyactein) and compound 13 (cimigenol). Then, we examined the antitumor effect of these two selective candidate chemicals on triple-negative breast cancer (TNBC) cells in vivo and found that they could reduce tumor growth in subcutaneous tumor model or breast cancer liver metastasis model.

**Conclusion:** These results suggested that the selective compounds isolated from *C. yunnanensis* Hsiao could be the promising new agents for TNBC treatment.

**Keywords:** *Cimicifuga*, *Cimicifuga yunnanensis*, cycloartane triterpenoids, anticancer activity, triple-negative breast cancer, breast cancer liver metastasis

## Introduction

*Cimicifuga* is a genus belonging to the Ranunculaceae family, which composes of 18 species in the whole world and eight species in the People's Republic of China.<sup>1</sup> The rhizomes of *Cimicifuga dahurica* (Turcz) Maxim, *Cimicifuga heracleifolia* Kom, and *Cimicifuga foetida* Linnaeus are called "Shengma", in traditional Chinese medicine (TCM), which have been used as antipyretic and analgesic agents and have been recorded in the Chinese pharmacopeia (CPC, 2010).<sup>2,3</sup> In USA and Europe, black cohosh (*Caulerpa racemosa* [L.] Nutt.) is widely used as a herbal dietary supplement for the relief of menopause-related symptoms, with a clinical history over the past 40 years.<sup>4,5</sup> The cycloartane triterpene glycosides are considered to be the main bioactive components of *Cimicifuga yunnanensis*.<sup>6</sup> Although more than 40 triterpenes and

triterpene glycosides have been isolated from *Cimicifuga*, the antitumor effect of this herb and its compounds have not been explored yet.<sup>6-9</sup>

In searching for novel antitumor agents from natural products, we found that the ethanol extracts from the rhizomes of *C. yunnanensis* exhibited antitumor effect on cancer cells. To evaluate the anticancer activities of *C. yunnanensis*' rhizome, we performed bioassay-guided fractionation on the extracts and isolated 16 purified components (1–16; Figure 1) elucidated as cycloartane triterpenes and chromones. Structural

elucidation was achieved by using spectroscopic data (nuclear magnetic resonance [NMR] spectroscopy and mass spectrometry) and related references. For cellular-level antitumor effect study, we performed MTT assay and found that, among these compounds, 23-epi-26-deoxyactein (**4**) and cimigenol (**13**) have dramatic antitumor effect on breast cancer cells and especially on triple-negative breast cancer (TNBC) cell line, MDA-MB-231, compared with other compounds. We further identified the in vivo antitumor effect of these two compounds on MDA-MB-231 cells and found that 23-epi-26-deoxyactein

**Figure 1** Structures of compounds 1–16.

**Note:** The structure of all compounds was tested using NMR spectral data analysis.

**Abbreviation:** NMR, nuclear magnetic resonance.

and cimigenol inhibited the subcutaneous growth and intra-hepatic growth of MDA-MB-231 cells.

## Materials and methods

### Plant material

The plant material of *C. yunnanensis* Hsiao, in the Ranunculaceae family and *Cimicifuga* genus, which consisted of the underground part of the plant, was collected by Yang Lixin, Prof Pei Sheng Ji, Prof Li Bin Jun, and Chen Guiqing of the Applied Ethnobotany Research Group in the Laboratory of Ethnobotany, on August 29, 2006, in Gezi Village, Shigu Township of Yulong Country, Yunnan Province, People's Republic of China, along the Yangtze river at an altitude of 1,647 m. The precise location was N26°58'13", E99°57'19". The specimen number is 6829 and is deposited in the evidential herbarium at the Laboratory of Ethnobotany. The green part of the plant was air-dried on a paper box at 23°C for 15 days and was subsequently stored and crushed at room temperature.

### General Methods

The NMR spectra were obtained using Bruker AM 400 NMR at 400 MHz (<sup>1</sup>H) and 100 MHz (<sup>13</sup>C) with tetramethylsilane (TMS) as the internal standard. Mass data were obtained on VG Auto Spec-3000 spectrometers. Silica gel (200–300 mesh) for column chromatography (CC) and GF<sub>254</sub> (Qingdao Marine Chemical Factory, Qingdao City, Shandong Province, People's Republic of China), D101 macroporous resin (Nankai Chemical Factory, Osaka, Japan), Lichroprep RP-18 (40–63 μm; EMD Millipore, Billerica, MA, USA), and Sephadex LH-20 (Pharmacia Fine Chemical Co., Ltd.) were used for CC. Fractions were monitored by thin layer chromatography (TLC), and spots were visualized by heating TLC sprayed with 10% H<sub>2</sub>SO<sub>4</sub>.

### Plant extraction and purification

The dried, milled rhizome of *C. yunnanensis* (2.3 kg) was extracted with 95% EtOH (×4). The extract was evaporated under reduced pressure to yield a syrup-like residue (about 380 g). The syrup was suspended in H<sub>2</sub>O and extracted successively with EtOAc (4 mL × 2,000 mL). After removing the solvent under reduced pressure at 60°C, the residue (180 g) was subjected to D101 macroporous resin CC (Ø 300 mm × 2,000 mm) using MeOH/H<sub>2</sub>O mixtures of increasing polarity (50:50, 90:10, 100:0, each 3,000 mL) to give three fractions. Fraction 2 (90 g) was repeatedly subjected to silica gel CC eluted with CHCl<sub>3</sub>/MeOH (9:1, 5:1, 3:1, 3:2, each 1,000 mL) to give four subfractions (A–D). Subfraction B was rechromatographed on silica gel CC eluted with CHCl<sub>3</sub>/

MeOH (9:1) to give two compounds: **1** (500 mg), **2** (250 mg). Subfractions C and D were rechromatographed on silica gel CC eluted with CHCl<sub>3</sub>/MeOH (5:1), then RP-18 using MeOH–H<sub>2</sub>O (6:4) to afford two compounds: **3** (24 mg), **4** (49 mg). Fraction F3 (70 g) was repeatedly subjected to silica gel CC eluted with CHCl<sub>3</sub>/MeOH (9:1, 5:1, 3:1, each 1,000 mL) to give three subfractions (E–G). Subfraction E was purified on Sephadex LH-20 (MeOH) and silica gel CC to give four compounds: **5** (60 mg), **6** (43 mg), **7** (60 mg), **8** (160 mg). Subfraction F was rechromatographed on RP-18 using MeOH–H<sub>2</sub>O (1:1, 2:1, 3:1, 4:1, each 1,000 mL) as an elution to give four subfractions F1–F4. Subfraction F2, after purified on silica gel CC (Ø 15 mm × L 400 mm) eluted with CHCl<sub>3</sub>/MeOH (7:1) yielded compounds **9** (17 mg) and **10** (15 mg). Subfraction F3 after purified on silica gel CC (Ø 15 mm × L 400 mm) eluted with CHCl<sub>3</sub>/MeOH (9:1) yielded compounds **11** (14 mg), **12** (13 mg). Subfraction G was rechromatographed on RP-18 using MeOH–H<sub>2</sub>O (1:1, 2:1, 3:1, 4:1, each 1,000 mL) and purified on silica gel CC eluted with CHCl<sub>3</sub>/MeOH yielded compounds **13** (54 mg), **14** (47 mg), **15** (15 mg), and **16** (35 mg). All compounds were tested by HPLC before using NMR spectral data analysis.

### HPLC analysis

To determine the purity of all compounds, compounds **1–16** were subjected to XTerra Rp18 (5 μm, 3.9 internal diameter (i.d.) × 150 mm; Waters Corporation, Milford, Massachusetts, USA) column in HPLC (LC-20AT; Shimadzu, Kyoto, Japan). The samples were dissolved in MeOH (0.2 mg/mL) and injected into column (10 μL) in a mobile phase with the flow rate of 1 mL/min. The samples were eluted with a linear gradient from the initial 30% acetonitrile in 0.1% formic acid to 80% acetonitrile in 0.1% formic acid for 40 minutes and additional elution with 100% acetonitrile for 10 minutes.

### Chemical structure of compounds **1–16**

The bioactive-guided purification of the crude extract on silica gel yielded 16 pure bioactive compounds **1–16**, whose chemical structures (Figure 1) were identified by means of <sup>1</sup>H and <sup>13</sup>C NMR and fast Atom Bombardment mass (FAB-MS) data. These data were in accordance with previously reported data on literatures.

### Cell lines and cell culture

Human breast cancer cells, MCF-7 (an endocrine-dependent breast cancer cell line), MDA-MB-231 (TNBC), and SK-BR3 (a HER2-positive breast cancer cell line), were all purchased and originated from the Type Culture Collection of the Chinese Academy of Sciences (Shanghai, People's Republic of

China). Among these cells, MCF-7 and MDA-MB-231 were the gift from Dr Fan Feng from research center for clinical and translational medicine, the 302nd Hospital of Chinese PLA, Beijing, People's Republic of China.<sup>10,11</sup> Cells were cultured in a humidified atmosphere of 5% CO<sub>2</sub> in air and fed with the culture medium of DMEM (Thermo Fisher Scientific, Waltham, MA, USA), 10% FBS (Thermo Fisher Scientific), and 1% penicillin–streptomycin solution (Thermo Fisher Scientific). The usage of cell lines or experiment protocols was all approved by the ethics committee of the Kunming Institute of Botany, Chinese Academy of Sciences.

### MTT assay on breast cancer cells

The MTT assay was used to measure the cytotoxicity of compounds 1–16 on breast cancer cells following the methods described in the studies by Zhang et al<sup>11</sup> and Ma et al.<sup>12</sup> Adriamycin was chosen as a positive control, and the concentrations of compounds used in MTT experiments were 0.08, 0.4, 2, 10, and 50 µg/mL. Inhibition rates were calculated as follows: (OD 490 nm of control group – OD 490 nm of administration group)/(OD 490 nm of control group – OD 490 nm of blank group) × 100%. IC<sub>50</sub> value of compounds was calculated based on Inhibitory rates (IR) of indicated concentration of compounds on cells. To evaluate the bioactive components of four compounds, the *in vivo* antitumor effect was identified.

### Subcutaneous tumor formation

Animal experiments were approved by the Animal Care Committee of Kunming Institute of Botany, People's Republic of China. Four- to five-week-old female mice with severe combined immunodeficiency (SCID) were inoculated with 1 × 10<sup>7</sup> MDA-MB-231 cells. Animal studies were carried out in accordance with the UK Animals (Scientific Procedures) Act, 1986, and associated guidelines. When the volume of tumors reached about 300 mm<sup>3</sup>, mice were randomly allocated into four groups: solvent control, 23-epi-26-deoxyactein, cimigenol, or adriamycin. For each treatment, sorafenib (1.5 mg/kg) or rifampicin (2 mg/kg) was given via oral gavage administration twice per week for 3 weeks. Tumor size was monitored every week by measuring the length and width using a caliper after compound injection.<sup>13,14</sup> The volume of tumors was calculated as follows: width<sup>2</sup> × length/2<sup>13,14</sup>. Finally, tumors were dissected out and weighed.

### Transwell experiments

MDA-MB-231 cells were cultured and treated with solvent control, compound 4, compound 13, or adriamycin for 24 hours. Then, the cells were harvested for transwell analysis.

Transwell analysis was performed following the methods described in the studies by Li et al<sup>15</sup> and Zhang et al.<sup>16</sup> The relative invasion or migration cell number inhibition was calculated by (OD 546 nm of administration group)/(OD 546 nm of control group). The inhibition rate of compounds on MDA-MB-231 cells' *in vitro* invasion or migration was calculated as follows: (relative invasion cell number of control group – relative invasion cell number of administration group)/(relative invasion cell number of control group) or (relative migration cell number of control group – relative migration cell number of administration group)/(relative migration cell number of control group).

### Breast cancer liver metastasis formation

To prepare a breast cancer liver metastasis model, MDA-MB-231 cells were cultured and injected into live nude mice via hepatic portal vein (1 × 10<sup>4</sup> per animal). After 1-week growth, mice were divided into four groups and treated with 1) control; 2) 2 mg/kg compound 4; 3) 2 mg/kg compound 13; or 4) 2 mg/kg compound 4; or Adriamycin for 2 weeks (once per day). Finally, mice were analyzed by positron emission tomography/computed tomography (PET/CT) screening.<sup>17–20</sup> The <sup>18</sup>F-fluorodeoxyglucose (<sup>18</sup>F-FDG) image of nodules formed by MDA-MB-231 cells was quantitatively analyzed by Image J software following the methods described by Wu et al,<sup>21</sup> Shao et al,<sup>22</sup> and Xie et al.<sup>23</sup>

### Statistical analyses

All statistical significance analyses were performed by Bonferroni correction with or without two-way ANOVA using SPSS 16.0 statistical software (SPSS Inc., Chicago, IL, USA). The IC<sub>50</sub> values of compounds were calculated by Origin 6.1 software.

## Results

### The identification of compounds from *C. yunnanensis*

By bioactive-guided purification, from the crude extracts of *C. yunnanensis*, 16 pure bioactive compounds 1–16 (Figure 1 and Table S1) were identified as follows: actein (1),<sup>24</sup> cimigenol-3-*O*-β-D-xylopyranoside (23R,24S) (2),<sup>25</sup> 26-deoxyacetylactein-3-*O*-α-L-arabinopyranoside (3),<sup>26</sup> 23-epi-26-deoxyactein (4),<sup>27</sup> cimifugin (5),<sup>28</sup> cimifugin glucoside (6),<sup>28</sup> norcimifugin glucoside (7),<sup>29</sup> norkhellol (8),<sup>30</sup> 25-*O*-acetyl-cimigenol (9),<sup>31</sup> 26-deoxyacetylactein (10),<sup>25</sup> acetylactein (11),<sup>25</sup> 25-*O*-methyl-cimigenol (12),<sup>26</sup> cimigenol (13),<sup>31</sup> 25-*O*-acetylcimigenol-3-*O*-β-D-xylopyranoside (14),<sup>29</sup> 24-*O*-acetylhydroshengmanol-3-*O*-β-D-xylopyranoside (15),<sup>32</sup> 26-deoxyactein (16)<sup>33</sup> by using <sup>1</sup>H and <sup>13</sup>C NMR

FAB-MS spectroscopic data and referring previously reported data. The purity of compounds 1–16 was determined by HPLC. They showed single peak in XTerra Rp18 column with retaining times. Among them, compounds **1**, **3**, **5–12**, and **16** are new isolated chemicals in this genus. The HPLC results of compounds 1–16 are shown in Figure S1.

### The in vitro antitumor effect of selective compounds on different breast cancer cells

All isolated compounds were screened for in vitro antitumor activity. The  $IC_{50}$  values of these compounds were evaluated based on MTT assay results as summarized in Table 1. Compounds **4** and **13** have most dramatic cytotoxic effect on breast cancer cells. The  $IC_{50}$  values of compound **13** against human breast cancer cell lines, MCF-7, MDA-MB-231, and SK-BR3, were 0.1  $\mu\text{g/mL}$ , 0.32  $\mu\text{g/mL}$ , and 0.21  $\mu\text{g/mL}$ , respectively, whereas  $IC_{50}$  values of compound **4** on these cell lines were 3.1  $\mu\text{g/mL}$ , 2.5  $\mu\text{g/mL}$ , and 5.5  $\mu\text{g/mL}$ , respectively. Other compounds, eg, **10**, **12**, and **16**, showed moderate antitumor effect against breast cancer cells. Since TNBC represents the most therapeutically intractable type compared with endocrine-related breast cancer or HER-positive breast cancer, we asked if those novel compounds have antitumor effect of compounds on TNBC cell line. Notably, we found that compounds **4** and **13** have promising antitumor effect on MDA-MB-231, a highly aggressive TNBC cell line.

### The in vivo antitumor effect of selective compounds on TNBC subcutaneous tumor models

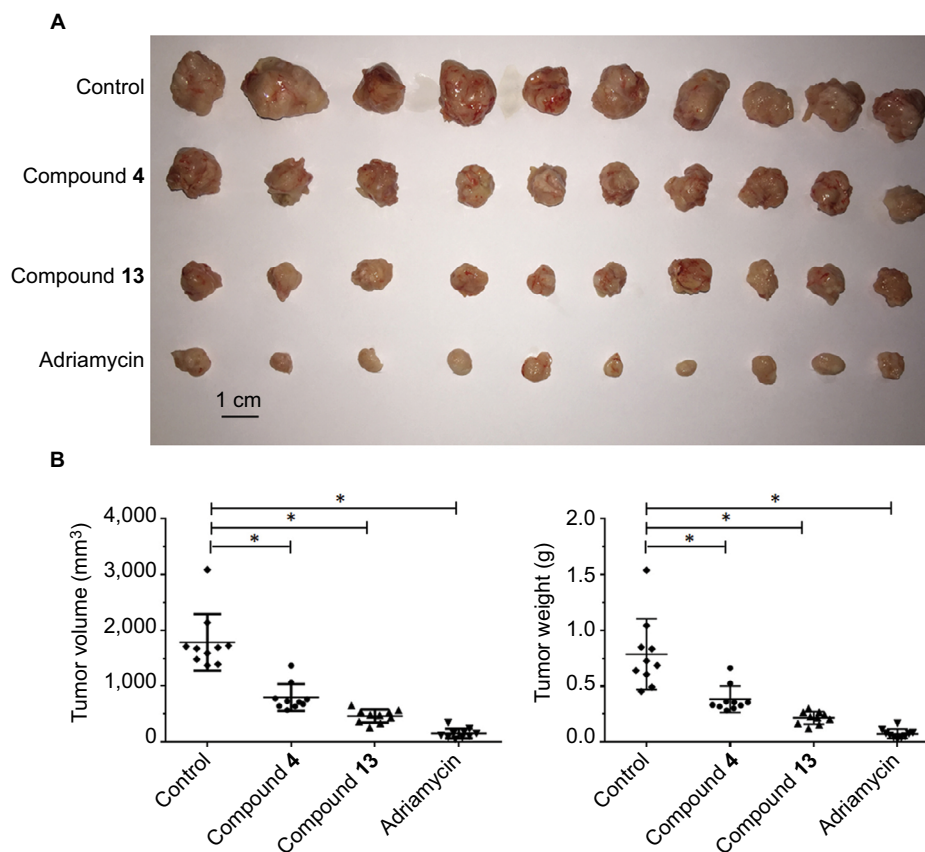

Next, we evaluated the in vivo antitumor effect of the selective compounds on tumors established by TNBC MDA-MB-231 cells. For MDA-231 subcutaneous tumor model, tumor-bearing nude mice received compound **4** or **13**, and adriamycin was used as positive control, for 3 weeks. At the end point, tumor volume and weight were measured. As shown in Figure 2, compound **4** or **13** could inhibit the subcutaneous growth of MDA-MB-231 cells in nude mice. However, the antitumor effects of the selective compounds were lower than the positive control, adriamycin. Overall, these results revealed the in vivo antitumor activation of selective compounds on MDA-MB-231 cells.

### The inhibitory activation of selective compounds on TNBC cells' in vitro invasion or migration

Based on the fact that highly aggressive ability is one of the foremost features of TNBC cells, the transwell experiments were performed to examine the in vitro invasion or migration of MDA-MB-231 cells. Compound **4** or **13** could inhibit the in vitro invasion (Figure 3) or migration (Figure 4) of MDA-MB-231 cells. However, the antitumor effects of the selective compounds were lower than the positive control,

**Table 1**  $IC_{50}$  values of compounds 1–16 on breast cancer cells, MCF-7, MDA-MB-231, or Sk-Br3

Compounds	$IC_{50}$ ( $\mu\text{g/mL}$ )

Adriamycin	1.7	2.4	1.90

**Figure 2** Compound 4 or 13 inhibited the subcutaneous growth of MDA-MB-231 cells.

**Notes:** MDA-MB-231-H cells were injected into nude mice to form subcutaneous tumors. Next, mice were divided into four groups: 1) solvent control group; 2) compound 4 group; 3) compound 13 group; (4) adriamycin group. Results are shown as follows: (A) photographs, (B) tumor volumes, and (C) tumor weights. \* $P < 0.05$ .

adriamycin (Figures 3 and 4). Therefore, these results further revealed the antitumor effect of compounds and showed that compounds could inhibit the *in vitro* migration or invasion of MDA-MB-231 cells.

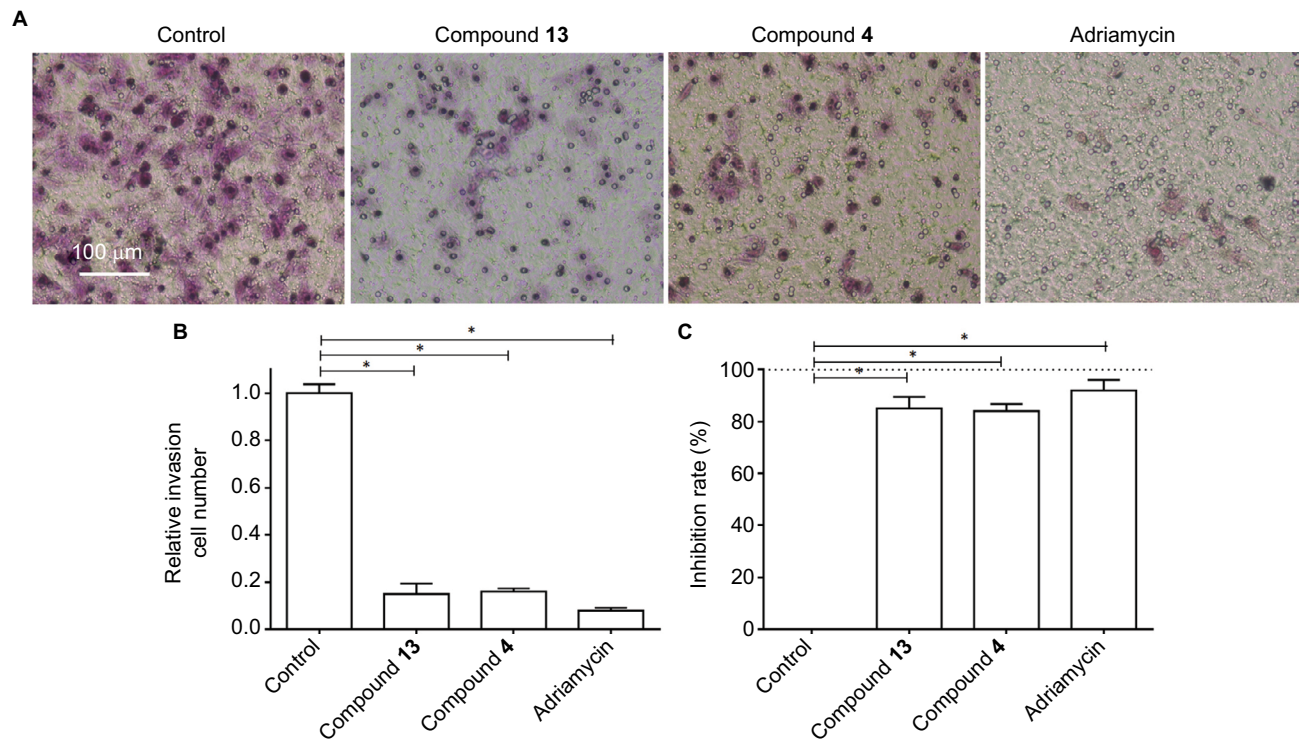

### The inhibitory activation of selective compounds on TNBC cells' liver metastasis

Next, based on the highly aggressive feature of MDA-MB-231 cells, the breast cancer liver metastasis assay was performed. MDA-MB-231 cells were injected into liver organs via hepatic portal vein and formed multi-nodules of tumors. The treatment of compound 4, compound 13, or adriamycin was performed after the tumors were established and lasted for 2 weeks. Intrahepatic growth of MDA-MB-231 cells in nude mice was detected by PET/CT screening at the end point, and tumor volume and weight were measured. As shown in Figures 5 and 6, compound 4 and compound 13 have a good antitumor effect on MDA-MB-231' intrahepatic growth in nude mice. However, the antitumor effects of the selective compounds were lower than the positive

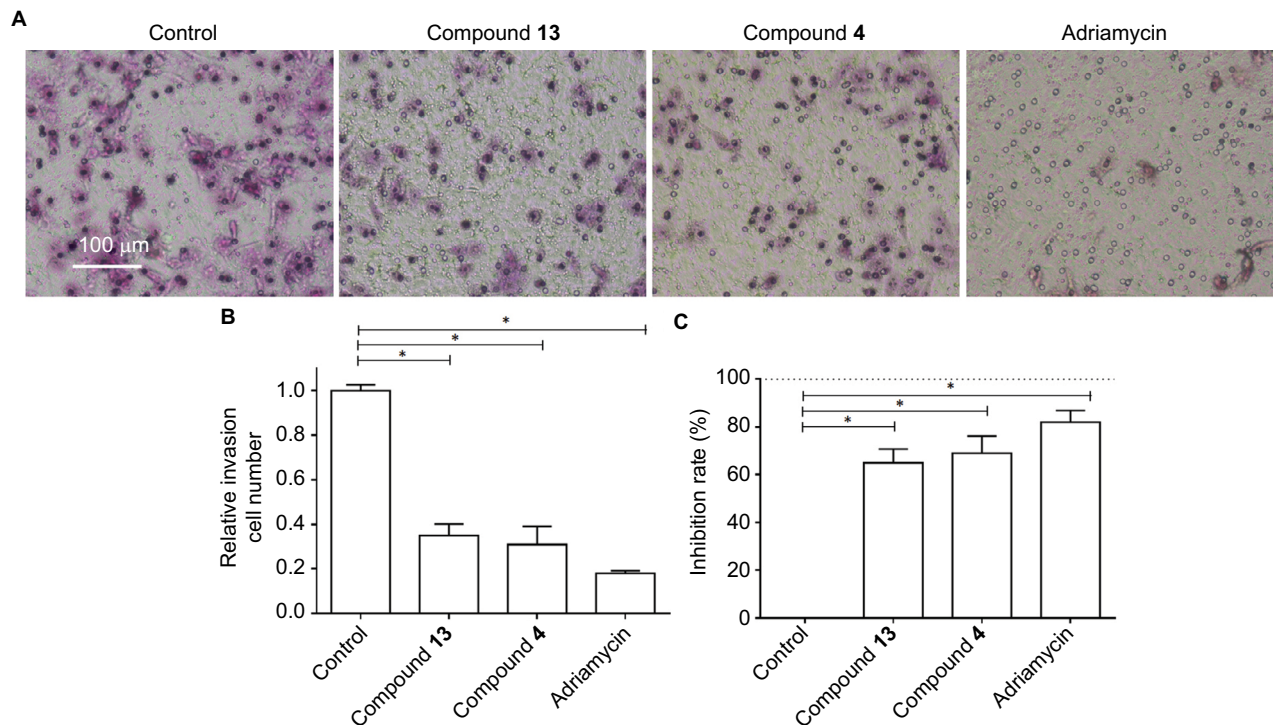

control, adriamycin (Figures 5 and 6). Therefore, selected compounds could effectively inhibit the liver metastasis of MDA-MB-231 cells.

### Discussion

As the secondary metabolic agents preserved through natural selection in the process of the biological evolution during millions of years, natural products have chemical and biological diverse features.<sup>34,35</sup> With the characteristics of biological activity or chemical–structural diversity, natural product not only provides us with novel antitumor drugs but also inspires us in terms of chemical synthesis and structural modification, which can be identified as the precursor of semisynthesis.<sup>36,37</sup> Several important and effective chemotherapeutic drugs are natural products or with structurally natural modifications, such as doxorubicin,<sup>37</sup> paclitaxel,<sup>38</sup> and etoposide.<sup>39,40</sup> In this study, we show the potential use of isolated compounds 4 and 13 from *C. yunnanensis* Hsiao as treatment options for breast cancer, especially in TNBC. Structurally, cycloartane triterpenoids seem to have higher anticancer activities than chromones. These data suggest

**Figure 3** Compound 4 or 13 inhibited the in vitro invasion of MDA-MB-231 cells. **Notes:** MDA-MB-231 cells were treated with  $IC_{50}$  of compound 4, compound 13, or adriamycin for 24 hours. Then, the cells were harvested for transwell experiments to reveal the in vitro invasion of MDA-MB-231 cells. Results are shown as follows: (A) photographs, (B) relative invasion number, or (C) inhibition rate of compound 4, compound 13, or adriamycin on MDA-MB-231's in vitro invasion. \* $P < 0.05$ .

**Figure 4** Compound 4 or 13 inhibited the in vitro migration growth of MDA-MB-231 cells. **Notes:** MDA-MB-231 cells were treated with  $IC_{50}$  of compound 4, compound 13, or adriamycin for 24 hours. Then, the cells were harvested for transwell experiments to reveal the in vitro migration of MDA-MB-231 cells. Results are shown as follows: (A) photographs, (B) relative migration number, or (C) inhibition rate of compound 4, compound 13, or adriamycin on MDA-MB-231's in vitro migration. \* $P < 0.05$ .

**Abbreviation:** PET, positron emission tomography.

that triterpenoid saponin from *Cimicifuga* might be helpful for its anticancer activity. Next, we will try to find the structure–activity relation of these compounds.

Breast cancer is one of the foremost threatens of female health nowadays. There are three major pathological types of human breast cancer: 1) endocrine-related breast cancer;<sup>41–43</sup> 2) HER2-positive breast cancer;<sup>44–46</sup> and 3) TNBC.<sup>47–49</sup> Among these types, estrogen receptor antagonists have good antitumor effects in endocrine-related breast cancer treatment.<sup>50–52</sup> Molecular targets agents, eg, trastuzumab, significantly improved the prognosis and quality of life of HER2-positive breast cancer patients.<sup>53–57</sup> However, the treatment option for TNBC is still limited.<sup>58</sup> Certain molecular targeted agents are effective in TNBC treatment; however,

the cost of the molecular targeted therapy became a heavy medical burden.<sup>58–60</sup> In this study, we show that compounds 4 and 13 could inhibit the in vitro and in vivo growth of TNBC cell line, MDA-MB-231. Although the in vitro antitumor effect of compound 13 or 4 was better than that of adriamycin, the in vivo effect of these compounds was lower than adriamycin. Based on the fact that the solubility and absorbency of adriamycin are very good, the solubility and absorbency of selective compounds would be the limit of their in vivo application. Therefore, the solubility and bioavailability may limit the in vivo application of the isolated compounds treating TNBC. Further improvement in chemical properties by chemical modifications and novel formulations of these compounds are urgently needed for

**Figure 6** Compound 4 or 13 inhibited the intrahepatic growth of MDA-MB-231 cells.

**Notes:** MDA-MB-231 cells were injected into nude mice's liver via hepatic portal vein. Next, mice were divided into four groups: 1) solvent control group; 2) compound 4 treatment group; 3) compound 13 treatment group; 4) adriamycin treatment group. The tumor nodules formed by MDA-MB-231 cells in the mice's liver were examined by <sup>18</sup>F-MicroPET scanning. After <sup>18</sup>F-MicroPET scanning, the liver organs in mice were harvested. Results are shown as follows: (A) tumor organs or (B) radioactivation of tumor tissue to blood or (C) relative nodule formed by MDA-MB-231 cells in the liver organ. \* $P < 0.05$ .

the next step to improve the solubility and bioavailability of compounds.

## Conclusion

In this study, our results suggested that the selective compounds isolated from *C. yunnanensis* Hsiao could be promising new agents for TNBC treatment.

Abbreviation: NMR, nuclear magnetic resonance.

**Cancer Management and Research**

Dovepress

**Publish your work in this journal**

Cancer Management and Research is an international, peer-reviewed open access journal focusing on cancer research and the optimal use of preventative and integrated treatment interventions to achieve improved outcomes, enhanced survival and quality of life for the cancer patient. The manuscript management system is completely online and includes

a very quick and fair peer-review system, which is all easy to use. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.

Submit your manuscript here: <https://www.dovepress.com/cancer-management-and-research-journal>
