ABSTRACT

Background

This represents the first update of this review, which was published in 2012. Atorvastatin is one of the most widely prescribed drugs and the most widely prescribed statin in the world. It is therefore important to know the dose-related magnitude of effect of atorvastatin on blood lipids.

Objectives

Primary objective

To quantify the effects of various doses of atorvastatin on serum total cholesterol, low-density lipoprotein (LDL)-cholesterol, high-density lipoprotein (HDL)-cholesterol and triglycerides in individuals with and without evidence of cardiovascular disease. The primary focus of this review was determination of the mean per cent change from baseline of LDL-cholesterol.

Secondary objectives

- To quantify the variability of effects of various doses of atorvastatin.
- To quantify withdrawals due to adverse effects (WDAEs) in placebo-controlled randomised controlled trials (RCTs).

Search methods

We searched the Cochrane Central Register of Controlled Trials (CENTRAL) (Issue 11, 2013), MEDLINE (1966 to December Week 2 2013), EMBASE (1980 to December Week 2 2013), Web of Science (1899 to December Week 2 2013) and BIOSIS Previews (1969 to December Week 2 2013). We applied no language restrictions.

Selection criteria

Randomised controlled and uncontrolled before-and-after trials evaluating the dose response of different fixed doses of atorvastatin on blood lipids over a duration of three to 12 weeks.

Data collection and analysis

Two review authors independently assessed eligibility criteria for studies to be included and extracted data. We collected information on withdrawals due to adverse effects from placebo-controlled trials.

Main results

In this update, we found an additional 42 trials and added them to the original 254 studies. The update consists of 296 trials that evaluated dose-related efficacy of atorvastatin in 38,817 participants. Included are 242 before-and-after trials and 54 placebo-controlled RCTs. Log dose-response data from both trial designs revealed linear dose-related effects on blood total cholesterol, LDL-cholesterol, HDL-cholesterol and triglycerides. The [Summary of findings table 1](#) documents the effect of atorvastatin on LDL-cholesterol over the dose range of 10 to 80 mg/d, which is the range for which this systematic review acquired the greatest quantity of data. Over this range, blood LDL-cholesterol is decreased by 37.1% to 51.7% ([Summary of findings table 1](#)). The slope of dose-related effects on cholesterol and LDL-cholesterol was similar for atorvastatin and rosuvastatin, but rosuvastatin is about three-fold more potent. Subgroup analyses suggested that the atorvastatin effect was greater in females than in males and was greater in non-familial than in familial hypercholesterolaemia. Risk of bias for the outcome of withdrawals due to adverse effects (WDAEs) was high, but the mostly unclear risk of bias was judged unlikely to affect lipid measurements. Withdrawals due to adverse effects were not statistically significantly different between atorvastatin and placebo groups in these short-term trials (risk ratio 0.98, 95% confidence interval 0.68 to 1.40).

Authors' conclusions

This update resulted in no change to the main conclusions of the review but significantly increases the strength of the evidence. Studies show that atorvastatin decreases blood total cholesterol and LDL-cholesterol in a linear dose-related manner over the commonly prescribed dose range. New findings include that atorvastatin is more than three-fold less potent than rosuvastatin, and that the cholesterol-lowering effects of atorvastatin are greater in females than in males and greater in non-familial than in familial hypercholesterolaemia. This review update does not provide a good estimate of the incidence of harms associated with atorvastatin because included trials were of short duration and adverse effects were not reported in 37% of placebo-controlled trials.

PLAIN LANGUAGE SUMMARY

Effect of atorvastatin on cholesterol

This represents the first update of this review, which was published in 2012 ([Adams 2012](#)). Atorvastatin is one of the most widely prescribed drugs and the most widely prescribed statin in the world. It is an HMG-CoA reductase inhibitor that is prescribed to prevent adverse cardiovascular events and to lower blood total cholesterol and LDL-cholesterol. It is therefore important to know the magnitude of the effect that atorvastatin has on cholesterol. We searched for all evidence obtained from three- to 12-week trials reporting the effect of atorvastatin on blood cholesterol. This update found 42 additional trials and reports on 296 trials in 38,817 participants. Atorvastatin showed a consistent effect in lowering blood cholesterol over the dose range of 2.5 to 80 mg daily. The effect was greater with higher doses than with lower doses. Atorvastatin works similarly to rosuvastatin in lowering cholesterol but is about three-fold less potent. Risk of bias for all assessed trials was high. Review authors were unable to assess harms of atorvastatin because the included trials were too short, and because only 34 included trials assessed harms.

SUMMARY OF FINDINGS

Summary of findings for the main comparison. LDL-cholesterol-lowering efficacy of atorvastatin

LDL-cholesterol-lowering efficacy of atorvastatin

Patient or population: individuals with normal or abnormal lipid profiles

Settings: outpatient clinics

Intervention: atorvastatin

Comparison: placebo or baseline

Outcomes	Per cent change (95% CI) ^a	Number of participants (studies)	Quality of the evidence (GRADE)	Comments
LDL-cholesterol atorvastatin 10 mg/d	-37.1 (-37.3 to -36.9)	21,941 (188)	⊕⊕⊕⊕ High^d	Effect predicted from log dose-response equation is -37.2%
LDL-cholesterol atorvastatin 20 mg/d	-42.3 (-42.6 to -42.0)	9,310 (80)	⊕⊕⊕⊕ High^d	Effect predicted from log dose-response equation is -42.1%
LDL-cholesterol atorvastatin 40 mg/d	-47.4 (-48.0 to -46.9)	3,296 (37)	⊕⊕⊕⊕ High^d	Effect predicted from log dose-response equation is -47.0%
LDL-cholesterol atorvastatin 80 mg/d	-51.7 (-52.2 to -51.2)	4,281 (37)	⊕⊕⊕⊕ High^d	Effect predicted from log dose-response equation is -52.0%
WDAE^b all doses	RR ^c (0.98) (0.68 to 1.40)	3,688 (34)	⊕⊕⊕⊕ Very low^e	Only 34 out of 54 placebo-controlled trials reported withdrawals due to adverse effects

GRADE Working Group grades of evidence.

High quality: Further research is very unlikely to change our confidence in the estimate of effect.

Moderate quality: Further research is likely to have an important impact on our confidence in the estimate of effect and may change the estimate.

Low quality: Further research is very likely to have an important impact on our confidence in the estimate of effect and is likely to change the estimate.

Very low quality: We are very uncertain about the estimate.

^aCI: confidence interval.

^bWDAE: withdrawal due to adverse effect.

^cRR: risk ratio.

^dNot downgraded despite mostly unclear risk of selection and detection bias because of large quantity of data, narrow confidence intervals, consistency of effect estimate with that predicted from the log dose-response equation (shown in comments) and the fact that lipid parameters were measured primarily in independent laboratories, not by investigators.

^eHigh risk of loss of blinding bias and selective reporting bias plus wide confidence intervals.

[Atorvastatin for lowering lipids \(Review\)](#)

BACKGROUND

This represents the first update of this review, which was published in 2012 (Adams 2012).

Description of the condition

Cardiovascular disease is a major cause of death and disability in the developed world, accounting for more than one-third of total deaths (Kreatsoulas 2010). In the United States, cardiovascular disease causes one in three reported deaths each year (CDC 2011; Roger 2011). Existing evidence shows a weak association between adverse cardiovascular events and blood concentrations of low-density lipoprotein (LDL)-cholesterol in adults (Grundey 2004). The current recommended treatment for secondary prevention of adverse cardiovascular events consists of diet and lifestyle changes plus drug therapy with the drug class widely known as 'statins'.

Description of the intervention

Atorvastatin is the statin most widely prescribed in the world (IMS 2012). Atorvastatin and the five other available statins are prescribed to prevent adverse cardiovascular events and to lower blood total cholesterol and LDL-cholesterol. Atorvastatin is rapidly absorbed, reaching peak plasma concentration within 2.3 hours. The lipid-lowering effect of atorvastatin is not influenced by the time of day the drug is administered, probably because of its relatively long half-life of 20 hours. Atorvastatin is metabolised by cytochromes P-450 3A4 and P-450 3A5 to ortho-hydroxy atorvastatin and para-hydroxy atorvastatin. These two active metabolites extend the effect of atorvastatin on 3-hydroxy-3-methylglutaryl-CoA (HMG-CoA) reductase, resulting in a half-life of enzyme inhibition of 20 to 30 hours (Lins 2003; Schachter 2004; Goodman 2011). Atorvastatin and statins as a class have been shown in individual randomised controlled trials (RCTs), systematic reviews and meta-analyses of RCTs to reduce mortality and major vascular events in people with occlusive vascular disease (CTT 2005). They have been reported to reduce major vascular events in primary prevention populations; however, whether they reduce mortality remains controversial (Mills 2008; Taylor 2013; Therapeutics Initiative 2010; Abramson 2013). Determining the effects of statins on morbidity and mortality is not the objective of this systematic review. The purpose of this review is to learn more about the pharmacology of atorvastatin by characterising the dose-related effect and the variability of the effect of atorvastatin on four surrogate markers: blood total cholesterol, low-density lipoprotein (LDL)-cholesterol, high-density lipoprotein (HDL)-cholesterol and triglycerides.

How the intervention might work

Atorvastatin acts in the liver by inhibiting the rate-limiting enzyme for cholesterol synthesis, HMG-CoA reductase. This enzyme irreversibly converts 3-hydroxy-3-methylglutaryl CoA to mevalonate (Moghadasian 1999). This reaction is the third step in a sequence of reactions resulting in the production of many compounds including cholesterol and its circulating blood derivatives, LDL-cholesterol and very low-density lipoprotein (VLDL)-cholesterol (Gaw 2000). The prevailing hypothesis is that statins reduce mortality and morbidity in patients with occlusive vascular disease by reducing liver production of cholesterol and thus causing a reduction in blood LDL-cholesterol and a resulting decrease in atherogenesis. However, the HMG Co-A reductase enzyme is also responsible for the production of ubiquinone (co-

enzyme Q₁₀), heme a, vitamin D, steroid hormones and many other compounds. It remains possible that the beneficial effects of statins are due to actions other than the reduction of cholesterol. These other actions have been referred to as the pleiotropic effects of statins (Liao 2005). Independent of how the drug works, it is important to know the average per cent reduction in the lipid parameters associated with doses commonly taken by patients. The advantage of expressing the effect as per cent reduction as compared with absolute reduction from baseline is that the per cent reduction is a pure number, is independent of the unit of measurement and is independent of baseline parameters. For this review it was established that there was no correlation between the effect expressed as per cent reduction and the baseline value. Furthermore the per cent reduction from baseline in blood LDL-cholesterol at the present time represents the best available pharmacological marker of the magnitude of the effects of statins on the enzyme, HMG Co-A reductase.

Why it is important to do this review

Statins are the most widely prescribed class of drugs in the world. Statin prescribing and average prescribing doses are increasing. Clinicians have an approximate sense of the different potencies of the various statins, but a systematic assessment of the potency, the slope of the dose-response relationship and the variability of the effect has not been published for any of the statins. It is possible that in addition to differences in potency, the slope of the dose-response relationship or the variability of the response is different for different statins. A small number of previous systematic reviews have assessed the effects of statins on serum lipids (Bandolier 2004; Edwards 2003; Law 2003; Naci 2013). These review authors have demonstrated that various statins have different potency in terms of lipid lowering, and that higher doses of statins cause greater lowering of blood total cholesterol, LDL-cholesterol and triglycerides than are seen with lower doses. However, none of these systematic reviews have calculated the slope of the dose response or the variability of effect, and none are up-to-date. The limitation of the most comprehensive systematic review to date is that it presents data that are based on the average absolute reduction in LDL-cholesterol concentration - a parameter that is dependent in part on the magnitude of the baseline value (Law 2003). The purpose of our systematic review is to expand Law's work. As atorvastatin is the most widely prescribed statin in the world, we have chosen it as the first drug for study in this class. We used surrogate markers to measure the pharmacological effects of statins, which we defined as per cent change from baseline to describe the dose-response relationship of the effects of atorvastatin on blood total cholesterol, LDL-cholesterol, HDL-cholesterol and triglycerides. We plan to use this established methodology to study the other drugs in this class (cerivastatin, fluvastatin, lovastatin, pravastatin, simvastatin, rosuvastatin and pitavastatin) in subsequent reviews to permit comparison of those results with the findings documented here for atorvastatin.

OBJECTIVES

Primary objective

To quantify the effects of various doses of atorvastatin on serum total cholesterol, LDL-cholesterol, HDL-cholesterol and triglycerides in individuals with and without evidence of cardiovascular disease. The primary focus of this review was

determination of the mean per cent change from baseline of LDL-cholesterol.

Secondary objectives

- To quantify the variability of effects of various doses of atorvastatin.
- To quantify withdrawals due to adverse effects (WDAEs) in placebo-controlled RCTs.

METHODS

Criteria for considering studies for this review

Types of studies

We included placebo-controlled RCTs and uncontrolled before-and-after trials. We included the latter because it has been shown that there is no placebo effect of statins on lipid parameters (Tsang 2002). We included cross-over trials when data were provided for each separate phase of the trial, and when wash-out periods of at least three weeks were provided at the cross-over points. This duration of wash-out ensures that no carry-over effect will occur and allows lipid values to stabilise.

Types of participants

Study participants may or may not have evidence of cardiovascular disease. They may have normal lipid parameters or any type of hyperlipidaemia or dyslipidaemia. Investigators applied no age restrictions and included individuals with various co-morbid conditions including type 2 diabetes mellitus, hypertension, metabolic syndrome, chronic renal failure or cardiovascular disease.

Types of interventions

Atorvastatin was administered at a constant daily dose for a period of three to 12 weeks. This administration time window was chosen to allow at least three weeks for a steady state effect of atorvastatin to occur, and to keep the window short enough to minimise loss of participants to follow-up. We accepted data from studies in which atorvastatin was administered in the morning or in the evening, or in which this was not specified. Trials required a wash-out baseline dietary stabilisation period of at least three weeks during which all previous lipid-altering medication was withdrawn. This baseline phase ensured that participants followed a standard lipid-regulating diet and helped to stabilise baseline lipid values before initiation of treatment. The baseline wash-out phase was not required for trials in which participants were not receiving lipid-altering medications or dietary supplements before they were given atorvastatin.

Types of outcome measures

Primary outcomes

- Placebo-controlled RCTs: mean per cent change in LDL-cholesterol from baseline of different doses of atorvastatin minus per cent change from baseline with placebo.
- Before-and-after trials: mean per cent change in LDL-cholesterol from baseline of different doses of atorvastatin.

Secondary outcomes

- Placebo-controlled RCTs: mean per cent change in total cholesterol from baseline of different doses of atorvastatin minus mean per cent change from baseline with placebo.
- Before-and-after trials: mean per cent change in total cholesterol from baseline of different doses of atorvastatin. It is recognised that effects on total cholesterol are due primarily to effects on LDL-cholesterol, which is the reason that this is a secondary outcome.
- Placebo-controlled RCTs: mean per cent change in HDL-cholesterol from baseline of different doses of atorvastatin minus mean per cent change from baseline with placebo.
- Before-and-after trials: mean per cent change in HDL-cholesterol from baseline of different doses of atorvastatin.
- Placebo-controlled RCTs: mean per cent change in triglycerides from baseline of different doses of atorvastatin minus mean per cent change from baseline with placebo.
- Before-and-after trials: mean per cent change in triglycerides from baseline of different doses of atorvastatin.
- End-of-treatment variability (standard deviation (SD)) and coefficient of variation of LDL-cholesterol measurements for each dose of atorvastatin. It is important to know whether atorvastatin has an effect on the variability of lipid measures, and ultimately to compare this with the effects of other statins.
- Placebo-controlled RCTs: WDAEs. This important measure of harm can be assessed only in placebo-controlled trials.

Search methods for identification of studies

Electronic searches

We identified relevant trials of atorvastatin through a search of the Cochrane Central Register of Controlled Trials (CENTRAL) (2013, Issue 11), MEDLINE (1966 to December Week 2 2013), EMBASE (1980 to December Week 2 2013), the Institute for Scientific Information (ISI) Web of Science (1899 to December Week 2 2013) and BIOSIS Previews (1969 to December Week 2 2013). We checked the bibliographies of identified papers and applied no language restrictions to our search. See [Appendix 1](#) for details of the search strategies.

Searching other resources

In cases of incomplete reports, we conducted further searches to look for connected papers. We used previously published meta-analyses on the efficacy of HMG-CoA reductase inhibitors to help us identify references to trials (CTT 2005; Edwards 2003; Law 2003). We included grey literature by searching other resources.

Data collection and analysis

Selection of studies

Initial selection of trials involved retrieving and reading the titles and abstracts of all papers found in electronic search databases or bibliographic citations. We have provided a PRISMA flow diagram. Two review authors independently analysed the full-text papers to determine which trials should be included. Review authors turned to a third party to resolve disagreements. Two review authors independently extracted the data from each of the included trials. In cases of disagreement regarding a value, review authors reached consensus by recalculating data to determine the correct value.

Data extraction and management

Review authors directly extracted the mean per cent change from the data or calculated this value using baseline and endpoint data. We extracted standard deviations (SDs) and standard errors (SEs) from the report or calculated SDs and SEs when possible. We entered data from placebo-controlled and uncontrolled before-and-after trials into Review Manager 5 as continuous and generic inverse variance data, respectively. We conducted all meta-analyses using RevMan 5 (RevMan 2011).

Assessment of risk of bias in included studies

We assessed all trials using the 'Risk of bias' tool under the following categories: sequence generation, allocation concealment, blinding, incomplete outcome data, selective reporting and other biases as described in the *Cochrane Handbook for Systematic Reviews of Interventions* (Higgins 2011). We have reported this information in the 'Risk of bias' tables associated with each included trial.

Measures of treatment effect

We analysed treatment effects for each dose in placebo-controlled RCTs and in uncontrolled before-and-after trials separately. As the effects were similar and placebo was shown not to have an effect, we combined all efficacy study data from placebo and before-and-after trials and re-analysed them using the generic inverse variance fixed-effect model outside of this review to determine overall weighted effects and 95% confidence intervals (CIs).

Unit of analysis issues

Before-and-after trials are not RCTs. All placebo-controlled RCTs used a parallel-group design whereby participants were individually randomly assigned to atorvastatin or to placebo, and investigators reported and entered the mean measurement for each outcome for all participants. Therefore this review reflects no unit of analysis issues.

Dealing with missing data

Most commonly, the data not reported consisted of SDs of the change. For studies in which SDs were not provided, imputation was done. The imputed value used is the average weighted SD of the change from other trials in the review (Furukawa 2006). We contacted study authors to retrieve missing data.

Assessment of heterogeneity

The Chi² test is not appropriate for identifying heterogeneity because it has low power when few studies are included but has excessive power to detect clinically unimportant heterogeneity

when many studies are included. A better statistic is the I² statistic. I² = between-study variance/(between-study variance + within-study variance). This test measures the proportion of the total variation in the estimate of the treatment effect that is due to heterogeneity between studies. This statistic is independent of the number of studies included in the analysis (Higgins 2002). If I² ≥ 50%, we used the random-effects model to assess whether the pooled effect was statistically significant and to estimate conservatively the measure of the effect.

Assessment of reporting biases

We used funnel plots for all outcomes with more than 10 RCTs to assess whether publication bias was evident in this review.

Data synthesis

We synthesised data using the mean difference in continuous outcome effect measures for the lipid data. We entered WDAEs as dichotomous Mantel-Haenszel risk ratio (RR) data from placebo-controlled RCTs with RevMan 5.1.6 (RevMan 2011).

For before-and-after trials, we synthesised data using per cent change from baseline generic inverse variance data with RevMan 5.1.6.

We entered mean per cent reduction in lipid parameters from all trials into GraphPad Prism 4 to yield a weighted least-squares analyses based on the inverse of the square of the standard error for each lipid parameter to generate weighted log dose response curves.

Subgroup analysis and investigation of heterogeneity

The main subgroup analyses include the different doses of atorvastatin. We assessed heterogeneity using the I² statistic (Higgins 2002). We tried to identify possible causes of significant heterogeneity by carrying out several planned subgroup analyses, provided that sufficient numbers of trials were identified.

We analysed subgroups based on the following factors.

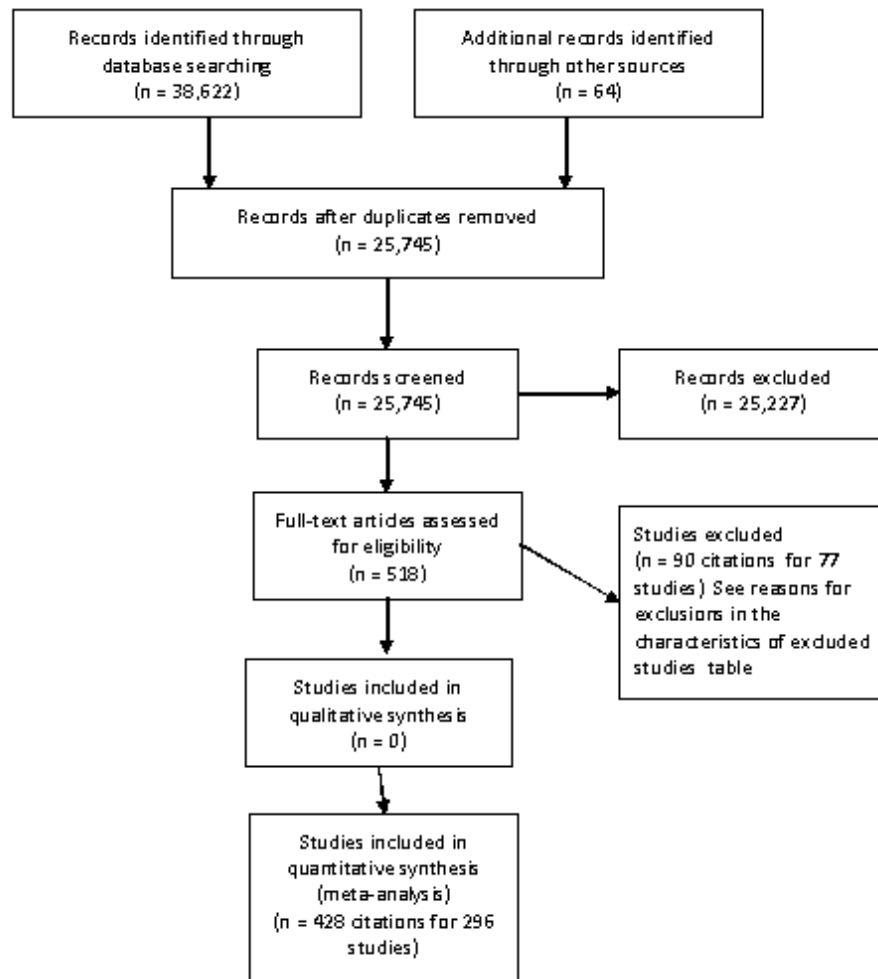

- Placebo-controlled RCTs versus uncontrolled before-and-after trials (described above).
- Efficacy of atorvastatin in males versus females.
- Efficacy of atorvastatin in individuals with familial versus non-familial hypercholesterolaemia.
- Morning administration time versus evening administration time analysis was not done because only one trial provided appropriate data.

RESULTS

Description of studies

Database searching identified 38,622 citations and 64 other resource citations, providing a total of 38,686 records. After we had removed duplicates, 25,745 records remained. Of these citations, review authors obtained 518 as full-text articles and assessed them for eligibility. For this update, 428 citations to 296 trials met the inclusion criteria and provided extractable data for use in evaluating the dose-related blood lipid-lowering effect of atorvastatin (Figure 1). This update includes 42 additional trials (five placebo-controlled and 37 before-and-after).

Figure 1.

We have summarised each included study in the [Characteristics of included studies](#) table. Of the 296 included studies, 282 (95%) were published in English, four (1.4%) in Russian, three (1.0%) in Chinese, two (0.7%) in Japanese, two (0.7%) in Polish, two

(0.7%) in Spanish and one (0.3%) in Portuguese. Of the 54 placebo-controlled trials, 46 (85.2%) were double-blind, two (3.7%) were single-blind and three (5.6%) were open-label; in three trials (5.6%), blinding information was not reported. We contacted study authors

to ask about the method of blinding used in these three trials but received no replies. Trials evaluating the lipid-altering efficacy of atorvastatin were first published in 1995. Between 1995 and 2014,

the number of available studies increased and then decreased. Most available studies were published in 2008 (see [Figure 2](#)).

Figure 2.

Number of Included Atorvastatin Trials

We excluded 75 studies because they did not meet the inclusion criteria. Reasons for exclusion included failure to report the number of participants, an inappropriate treatment period, inappropriate dosing, values expressed as ranges and for cross-over trials, no pre-cross-over data and dosing bias. We have listed the reasons for excluding each trial in the [Characteristics of excluded studies](#) table.

This updated review includes 296 trials involving 38,817 participants. These consist of 242 before-and-after trials and 54 placebo-controlled trials. The numbers of placebo participants and atorvastatin participants were 1929 and 36,888, respectively.

The numbers of male and female participants reported in 269 of the 296 trials were 20,228 and 16,454, respectively. Baseline mean (range) lipid parameters were as follows: total cholesterol, 6.65 (4.19-11.90) mmol/L, 257 (162-460) mg/dL; LDL-cholesterol, 4.50 (2.38-9.60) mmol/L, 174 (92-371) mg/dL; HDL-cholesterol, 1.25 (0.67-4.30) mmol/L, 48.4 (25.9-166.3) mg/dL; and triglycerides, 2.10 (0.76-7.44) mmol/L, 186 (67-659) mg/dL. Trials were available over the dose range of atorvastatin from 2.5 to 80 mg daily and were sufficient to generate dose-response regression lines for each of these lipid parameters ([Figure 3](#); [Figure 4](#); [Figure 5](#); [Figure 6](#)).

Figure 3. Values represent the results of each trial for each dose comparison. The standard error bars cannot be seen because they all lie within the points.

Figure 4. Values represent the results of each trial for each dose comparison. The standard error bars cannot be seen because they all lie within the points.

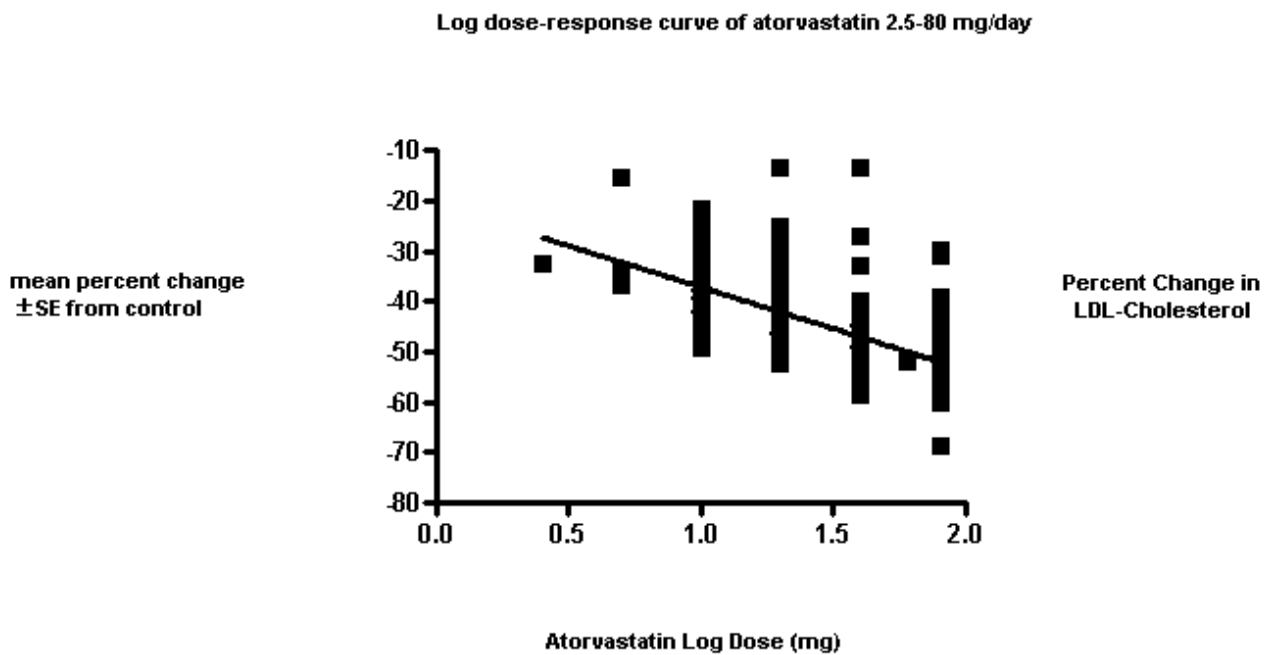

Figure 5. Values represent the results of each trial for each dose comparison. The standard error bars cannot be seen because they all lie within the points.

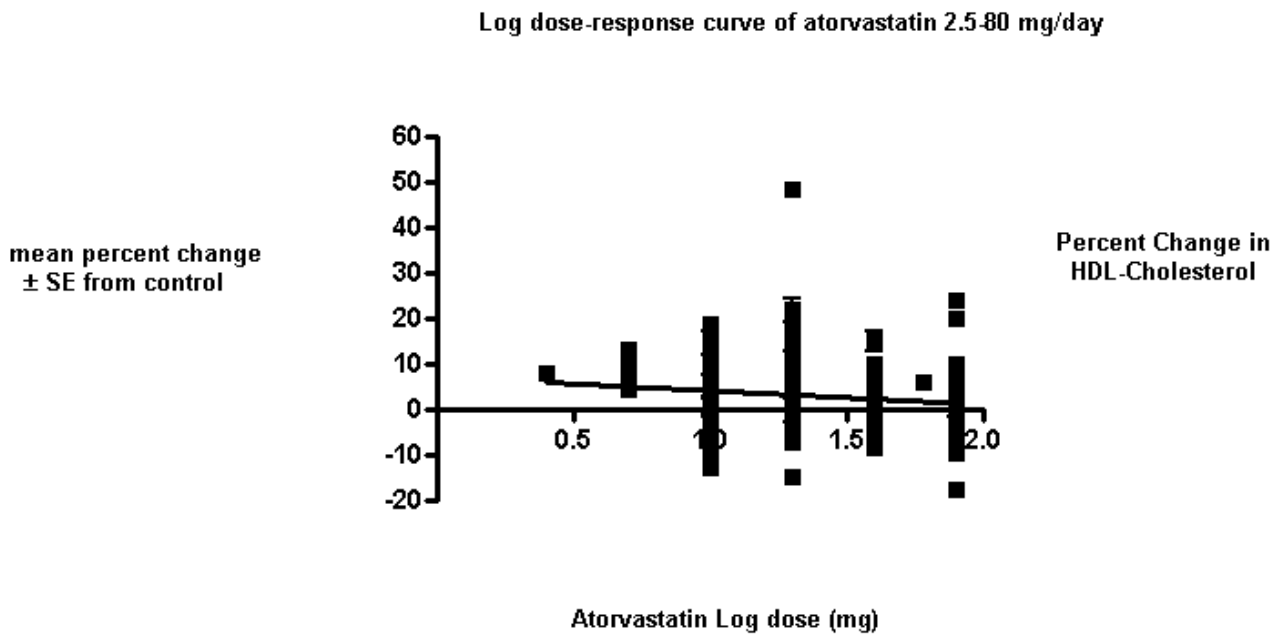

Figure 6. Values represent the results of each trial for each dose comparison. The standard error bars cannot be seen because they all lie within the points.

Risk of bias in included studies

Sequence generation and allocation concealment could not be applied to the 242 before-and-after trials. Of the 54 placebo-controlled trials, seven (13%) reported adequate sequence generation and 10 (18.5%) reported adequate allocation concealment. Thus risk of bias for these two categories was high.

Risk of blinding bias was high for all before-and-after trials plus the three open-label placebo-controlled RCTs, the three trials in which blinding was not mentioned and the two single-blind, placebo-controlled RCTs. However, lack of blinding probably had little effect on primary outcomes, which included laboratory measurements of lipid parameters. Lack of blinding could have had an effect on the ascertainment of WDAEs. Incomplete outcome reporting

leading to attrition bias was not a problem in this review, as few participants were lost to follow-up and > 95% of participants completed treatment. Of 296 trials, 230 (77.7%) reported all lipid

parameters; thus this was not a source of bias for the primary outcomes. See 'Risk of bias' tables in [Characteristics of included studies](#), and for the overall risk of bias, see [Figure 7](#) and [Figure 8](#).

Figure 7. Risk of bias graph: authors' judgements about each risk of bias item presented as percentages across all included studies.

Figure 8. Risk of bias summary: review authors' judgements about each risk of bias item for each included study.

	Random sequence generation (selection bias)	Allocation concealment (selection bias)	Blinding (performance bias and detection bias)	Incomplete outcome data (attrition bias)	Selective reporting (reporting bias)	Other bias

The other main potential source of bias is industry funding. Of the 296 trials, 140 (47%) reported funding by industry, 68 (23%) reported no funding by industry and 88 (29.8%) did not report the source of funding. Of the 140 industry-funded trials, 77 (55.4%) were funded by Pfizer, the manufacturer of atorvastatin, and 63 (45%) were funded by other pharmaceutical companies.

Effects of interventions

See: [Summary of findings for the main comparison LDL-cholesterol-lowering efficacy of atorvastatin](#)

Overall efficacy of atorvastatin

Doses of 2.5 and 60 mg were provided in only one trial each, so we did not include the lipid data in the [Data and analyses](#) but did include the WDAE data ([Data and analyses](#)). We also included these two trials in calculations of log dose-response curve equations. The efficacy of atorvastatin in lowering lipid parameters separately in placebo-controlled trials and in before-and-after trials is shown in the [Data and analyses](#) section. This demonstrates that the two trial designs provide similar estimates of the lipid-lowering efficacy of atorvastatin. In addition, we performed two-tailed one-sample t-tests from the placebo-controlled trials to test for differences between placebo mean effects and zero for total cholesterol, LDL-cholesterol, HDL-cholesterol and triglycerides. Results of these tests show that the placebo means were not statistically significantly different from zero: total cholesterol, -0.4 (95% CI -0.84 to 0.04), LDL-cholesterol, 0.2 (95% CI -0.04 to 0.44), HDL-cholesterol, 0.9 (95% CI 0.035 to 1.765) and triglycerides, 4.1 (95% CI 0.05 to 8.15). Evidence of lack of a placebo effect justified combining all trials to determine the overall efficacy of atorvastatin. This was done by entering all data into RevMan 5 using the generic inverse variance model outside of this review (data and analysis not shown). We have summarised the mean parameters from this analysis in [Table 1](#).

Dose-ranging effects of atorvastatin on blood lipids as calculated from the slopes of the log dose-response curve equations

We entered data from all trials into GraphPad Prism 4 to yield a weighted least squares analysis based on the inverse of the square of the standard error for each lipid parameter to generate weighted log dose-response curves for each of the lipid parameters.

Total cholesterol

The effects of different doses of atorvastatin on total cholesterol are shown in the [Data and analyses](#) section ([Analysis 1.1](#); [Analysis 2.1](#); [Analysis 2.2](#); [Analysis 3.1](#); [Analysis 3.2](#); [Analysis 4.1](#); [Analysis 4.2](#); [Analysis 5.1](#); [Analysis 5.2](#)). The updated analysis for total cholesterol yielded a log dose-response straight-line equation, $y = -12.02 \log(x) - 15.01$, which is similar to that provided in the original review and uses all data for atorvastatin doses ranging from 2.5 mg/d to 80 mg/d. When this formula was used, calculated reductions in total blood cholesterol were 19.8% for 2.5 mg and 37.9% for 80 mg. For every two-fold dose increase, a 3.6% (95% CI 3.2 to 4.0) decrease in blood total cholesterol was noted ([Figure 3](#)).

LDL-cholesterol

The effects of different doses of atorvastatin on LDL-cholesterol are shown in the [Data and analyses](#) section ([Analysis 1.2](#); [Analysis 2.3](#);

[Analysis 2.4](#); [Analysis 3.3](#); [Analysis 3.4](#); [Analysis 4.3](#); [Analysis 4.4](#); [Analysis 5.3](#); [Analysis 5.4](#)). The updated analysis for LDL-cholesterol yielded the log dose-response straight-line equation, $y = -16.41 \log(x) - 20.74$, which is a numerically but not statistically significant lower slope than was provided in the original review, -18.16. This analysis uses all available data for atorvastatin doses ranging from 2.5 mg/d to 80 mg/d. When this formula was used, calculated reductions in total blood LDL-cholesterol were 27.3% for 2.5 mg/d and 52.0% for 80 mg/d. For every two-fold dose increase, a 4.9% (95% CI 4.5 to 5.4) decrease in blood LDL-cholesterol was noted ([Figure 4](#)).

HDL-cholesterol

The effects of different doses of atorvastatin on HDL-cholesterol are shown in the [Data and analyses](#) section ([Analysis 1.3](#); [Analysis 2.5](#); [Analysis 2.6](#); [Analysis 3.5](#); [Analysis 3.6](#); [Analysis 4.5](#); [Analysis 4.6](#); [Analysis 5.5](#); [Analysis 5.6](#)). The updated analysis for HDL-cholesterol yielded a significant log dose-response straight-line equation, $y = -3.049 \log(x) + 7.288$. This represents a change from the original review, in which no significant log dose relation was seen for HDL. This analysis uses all available data for atorvastatin doses ranging from 2.5 mg/d to 80 mg/d. When this formula was used, calculated reductions in total blood HDL-cholesterol were 6.1% for 2.5 mg/d and 1.5% for 80 mg/d, suggesting that lower doses of atorvastatin increase HDL and higher doses cause this effect to diminish. For every two-fold dose increase, the HDL-cholesterol increasing effect of atorvastatin diminished by 0.9% (95% CI 0.3 to 1.5) ([Figure 5](#)).

Triglycerides

The effects of different doses of atorvastatin on triglycerides are shown in the [Data and analyses](#) section ([Analysis 1.4](#); [Analysis 2.7](#); [Analysis 2.8](#); [Analysis 3.7](#); [Analysis 3.8](#); [Analysis 4.7](#); [Analysis 4.8](#); [Analysis 5.7](#); [Analysis 5.8](#)). The updated analysis for triglycerides yielded the log dose-response straight-line equation, $y = -12.72 \log(x) - 7.206$, which is similar to that provided in the original review and uses all data for atorvastatin doses ranging from 2.5 mg/d to 80 mg/d. When this formula was used, calculated reductions in triglycerides were 12.3% for 2.5 mg/d and 31.4% for 80 mg/d. For every two-fold dose increase, a 3.8% (95% CI 2.7 to 5.0) decrease in blood triglycerides was noted ([Figure 6](#)).

End-of-treatment variability

In 35 of the 54 placebo-controlled trials, it was possible to compare end-of-treatment variability expressed as the co-efficient of variation of atorvastatin 5, 10, 20, 40 and 80 mg/d versus placebo. One-way analysis of variance showed a statistically significant increase in end-of-treatment variability of atorvastatin at all doses compared with placebo for total cholesterol (19.7 vs 14.7) and LDL-cholesterol (31.6 vs 22.0). No statistically significant differences between all doses of atorvastatin compared with placebo were noted in the end-of-treatment HDL-cholesterol co-efficient of variation and in the triglyceride co-efficient of variation.

Withdrawal data

Thirty-four (63%) of the 54 placebo-controlled trials reported WDAEs during the three- to 12-week treatment period. No atorvastatin dose-response relationship was observed for WDAEs; therefore a pooled estimate for all doses compared with placebo was done, providing a risk ratio (RR) of 0.98 (95% CI 0.68 to 1.40),

suggesting no effect of atorvastatin on WDAEs in these short-term trials, as was the case in the original review ([Analysis 6.1](#)).

Overall completeness and applicability of evidence

For the male versus female comparison, sufficient participant data (> 100 in each group) were available only for the dose of 10 mg/d. These data were analysed for LDL-cholesterol lowering efficacy using the generic inverse variance fixed-effect model in RevMan 5 outside of this review. For 10 mg/d, LDL-cholesterol lowering efficacy was -39.2% for male and -41.8% for female participants (P value < 0.05).

For the familial versus non-familial comparison, sufficient participant data (> 100 in each group) were available for doses of 10 mg/d and 20 mg/d. These data were analysed for LDL-cholesterol lowering efficacy using the generic inverse variance fixed-effect model in RevMan 5. This subgroup analysis revealed that efficacy in familial participants was less than in non-familial participants: 10 mg/d, -34.7% and -36.3% (P value 0.12) and 20 mg/d, -38.0% and -43.6% (P value < 0.00001), respectively.

Pfizer-funded versus non-Pfizer-funded LDL-cholesterol efficacy data were available for the doses 10, 20, 40 and 80 mg/d. These data were analysed separately using the generic inverse variance fixed-effect model in RevMan 5. This sensitivity analysis revealed that the lipid-lowering efficacy of atorvastatin in Pfizer-funded trials was lower at 10 mg/d (-36.8% vs -37.6%; P value 0.0004) but higher at 20 mg/d (-44.0% vs -42.9%; P value 0.03), was not different at 40 mg/d (-48.6% vs -48.8%; P value 0.78) and was higher at 80 mg/d (-53.3% vs -51.2%; P value < 0.0001).

Review authors assessed publication bias by reviewing the funnel plots for all lipid outcomes with 10 or more trials. None of these funnel plots showed significant asymmetry.

DISCUSSION

Summary of main results

Daily atorvastatin intake is highly effective in lowering blood low-density lipoprotein (LDL)-cholesterol concentrations, and it does so in a predictable dose-related manner. The [Summary of findings for the main comparison](#) documents the effect of daily atorvastatin intake on LDL-cholesterol over the manufacturer-recommended dose range of 10 to 80 mg/d, which is also the range for which this systematic review obtained the greatest quantity of data. Over this range, LDL-cholesterol is decreased by 37.1% to 51.7%. These large reductions reflect a reduction in synthesis of cholesterol by the liver and indicate that liver 3-hydroxy-3-methylglutaryl-co-enzyme A (HMG-CoA) reductase is inhibited by one-third to one-half over this dose range. This has significant implications beyond circulating cholesterol, as LDL-cholesterol is only one of many important biochemical products that are produced by the HMG-CoA reductase pathway. For example, a systematic review has shown that statins reduce plasma co-enzyme Q10 by 19% to 52% ([Marcoff 2007](#)). In addition, statins have been shown to reduce serum dolichol by 15.7% ([Elmberger 1991](#)) and serum squalene by 35.5% to 42.7% ([Uusitupa 1992](#)). This inhibitory effect occurs not only in the liver but also in other cells throughout the body ([Holmqvist 2008](#)). It is important to recognise that long-term consequences of inhibition of these other compounds are presently unknown.

In the updated [Data and analyses](#) section, it can be seen that more trials used a before-and-after design than a placebo-controlled design, and more data were derived from before-and-after trials than from placebo-controlled trials. For doses for which large numbers of trials and participants were included, it can be seen that estimates of effect of atorvastatin on lipid parameters are similar with the two different trial designs. This, plus the demonstration that the placebo effect was not different from zero, justified use of generic inverse variance and display of the combined estimates in [Table 1](#). In addition, all trial data were entered into GraphPad Prism 4 to calculate the regression lines shown in [Figure 3](#), [Figure 4](#), [Figure 5](#) and [Figure 6](#). Overall efficacy results from GraphPad Prism 4 provide the best estimate of treatment effect because it is based on a regression line calculated from all data for all doses. Estimates of average treatment effect derived from regression lines are similar to those shown in [Table 1](#). The only exception is the estimate for atorvastatin 5 mg, for which estimates are based on only three trials and most likely represent an overestimation of the lipid-lowering effect for that dose, as can be seen in [Figure 3](#).

What is the effect of atorvastatin on end-of-treatment variability?

End-of-treatment variabilities of atorvastatin and placebo were compared to determine the effect of atorvastatin on variability of blood lipids when expressed as a co-efficient of variation. Compared with placebo, atorvastatin at all doses increased the co-efficient of variation of blood total cholesterol and LDL-cholesterol. Atorvastatin did not significantly affect the variability of high-density lipoprotein (HDL) and triglyceride measurements. The significance of this effect of atorvastatin of increasing variability of cholesterol and LDL-cholesterol is unknown at this time.

Does atorvastatin increase withdrawals due to adverse effects?

Of 54 placebo-controlled trials, 34 (63%) reported WDAEs. This analysis represented only 3688 participants, 2256 of whom received atorvastatin and 1432 of whom received placebo. Results are similar to those of the original review ([Adams 2012](#)) and show no dose-response relationship of atorvastatin with WDAEs. The pooled estimate for all doses provided a similar risk ratio (RR) of 0.98 (95% CI 0.68 to 1.40), demonstrating uncertainty, but the possibility of a reduction or an increase in risk remains. As 20 (37%) of 54 placebo-controlled trials did not report WDAEs, risk of selective reporting bias for this outcome is high, and the null effect may be a result of that bias. Furthermore, this analysis was limited to trials of three to 12 weeks' duration and thus does not reflect adverse effects of atorvastatin that occur after intake of longer duration. Risk of participant selection bias is probably high in these trials, as many of the participants studied probably were known to tolerate statins at baseline.

Overall completeness and applicability of evidence

This updated review included 296 trials with 38,817 participants - representing a 16% increase in the quantity of data over data provided in the original review ([Adams 2012](#)). As such, this updated review has increased the certainty of evidence for the dose-related lipid-lowering effect of atorvastatin. Practitioners can use this evidence to calculate the expected effects of doses of atorvastatin commonly utilised in society. It is unlikely that further research will change these estimates appreciably. However, a fair amount of heterogeneity was noted in many of the

estimates, and it is possible that this was due to differences in the populations studied (e.g. gender or genetic differences) (Thompson 2005). To explore this, we compared when possible the lipid-lowering efficacy of atorvastatin between male and female trial participants and between participants with familial versus non-familial hypercholesterolaemia.

Subgroup analyses in male and female participants were limited to 14 trials at a dose of 10 mg/d of atorvastatin. Analysis showed a small statistically significant increase in effect in females as compared with males, which is consistent with an effect that is 7% greater in females than in males. This is a new conclusion that did not appear in the original review but that moves in the direction that would be anticipated, as females weigh less on average than males. It is also consistent with the effect of rosuvastatin 10 mg/d, which was greater in females than in males (Adams 2014). Additional data are needed for this comparison. It is important for study authors to report data separately by sex; if this had been done in more of these trials, we could have been more confident in putting forth this conclusion.

Subgroup analyses comparing the effects of atorvastatin in familial versus non-familial hypercholesterolaemia showed decreased efficacy of atorvastatin in lowering LDL-cholesterol among individuals with familial hypercholesterolaemia. This difference could not be demonstrated in the original review.

The profound and relatively consistent effect of atorvastatin on lipid parameters shown in this review is probably appreciated by clinicians who treat patients with these drugs. Whether or not a patient is taking a statin is also most likely evident to investigators involved in placebo-controlled randomised controlled trials (RCTs). Knowledge of lipid parameters almost certainly leads to loss of blinding in statin RCTs. The present review calls attention to this problem and suggests that efforts to prevent this loss of blinding are needed in future statin RCTs.

Quality of the evidence

The summary of all 'Risk of bias' tools for lipid effects suggests high risk of bias (Figure 7). However lipid parameter outcomes are probably relatively resistant to bias. If anything, high risk of bias would lead to an overestimation rather than an underestimation of lipid-lowering effects. However, because of the objectivity of the lipid parameters, we believe that the estimates of effects are reasonably accurate. This view is strengthened by the fact that we could not show evidence consistent with a funding bias (see below), and review of funnel plots did not suggest evidence of publication bias.

That is not true for the outcome of assessing harm - withdrawals due to adverse effects (WDAEs). This assessment could be performed only in placebo-controlled trials, and this outcome was not reported in 20 (37%) of the 54 placebo-controlled trials. Therefore risk of selective reporting bias is high, and this, combined with high risk of other biases, means that we cannot be confident that the suggested lack of increase in WDAEs is correct.

Other potential sources of bias

The most likely way that evidence of funding bias would be detected involved comparison of Pfizer-funded trials, in which an overestimation of effect associated with industry might be expected, versus non-Pfizer-funded trials, in which a bias towards

underestimation of the effect of atorvastatin might be expected. The fact that this comparison did not show a consistent effect one way or the other suggests that lipid measurements are relatively resistant to bias.

Potential biases in the review process

One limitation of this review is that many trials did not report standard deviations (SDs) for lipid-lowering effects. In those trials, SDs of the per cent change from baseline of blood lipid parameters were imputed as the average of this parameter from trials that reported it. These values were determined by the method of Furukawa 2006. Such imputation might weight some studies more or less; however, in other reviews this has been shown to have little effect on the estimate of effect size (Heran 2008). Another limitation is that in this review, few studies were available that could demonstrate the effects of atorvastatin at very low and very high doses.

Agreements and disagreements with other studies or reviews

The best estimate of the mean percent reduction in blood LDL-cholesterol for any dose of atorvastatin can be calculated from our log dose response equation. Using this equation $y = -16.41 \log(x) - 20.74$ an atorvastatin dose of 80 mg/day reduces LDL-cholesterol by an average of 52.0%. This is within the range of 46.3% to 55.4% reduction in LDL-cholesterol from the 11 comparative trials from the Drug Effectiveness Review Project (DERP) (Smith 2009), but significantly lower than the manufacturers prescribing information estimate of 60% (Lipitor Prescribing Information 2012) and the Adult Treatment Panel III estimate of 57% (NCEP 2002).

At the present time there is nothing to suggest that one statin is different than another statin in terms of the benefit in reduction of atherosclerotic-related events: myocardial infarction and ischaemic stroke (Taylor 2013). It will be useful to complete the reviews of the other statins, cerivastatin, fluvastatin, lovastatin, pravastatin and simvastatin, to know how they compare in terms of the dose-related effects on the lipid surrogate outcomes.

AUTHORS' CONCLUSIONS

Implications for practice

Specific findings of the review

- Atorvastatin 2.5 to 80 mg/d causes a linear dose-response reduction in per cent change from control of blood total cholesterol and LDL-cholesterol. Manufacturer-recommended atorvastatin doses of 10 to 80 mg/d resulted in 37.1% to 51.7% decreases in LDL-cholesterol. From the slope of the lines, it can be seen that for every two-fold increase, a 3.6% and 4.9% decrease in blood total cholesterol and LDL-cholesterol, respectively, was noted.
- Atorvastatin has a dose-response effect similar to that of rosuvastatin, but it is at least three-fold less potent than rosuvastatin in reducing total and LDL-cholesterol.
- Subgroup analyses suggest that the LDL-cholesterol-lowering effect of atorvastatin is greater in females than in males and is lesser in people with familial hypercholesterolaemia than in people with non-familial hypercholesterolaemia. These findings require confirmation by future trials.

- All doses of atorvastatin did not change WDAEs as compared with placebo (risk ratio (RR) 0.98, 95% confidence interval (CI) 0.68 to 1.40). However, risk of bias for this outcome is high; thus this cannot be considered a reliable estimate.

Implication of these findings

This systematic review provides the best available evidence on dose-related efficacy of atorvastatin for blood total cholesterol, LDL-cholesterol, HDL-cholesterol and triglycerides.

Implications for research

- More RCTs are needed of atorvastatin at higher and lower doses to expand the estimate of dose-response efficacy of atorvastatin over a wider dose range.

- All placebo-controlled RCTs must accurately report withdrawals due to adverse effects and all serious adverse events.
- All trials should report effects separately in males and in females, so it is possible to better determine whether any sex differences are present.
- All trials should report effects separately for patients with familial and non-familial hypercholesterolaemia to confirm whether efficacy is less in people with familial hypercholesterolaemia.

CHARACTERISTICS OF STUDIES
Characteristics of included studies [ordered by study ID]
3T study 2003

Methods	4-Week wash-out period 52-Week multi-centre randomised double-blind double-dummy 8-Week treatment period evening dose Randomisation code prepared by study statistician
Participants	1087 men and women from Scandinavia aged 35 to 75 years with CVD and dyslipidaemia; 552 participants received atorvastatin, 535 received simvastatin; LDL-C \geq 4.0 mmol/L (155 mg/dL) Exclusion criteria: TG \geq 4.0 mmol/L (354 mg/dL), TC \geq 10.0 mmol/L (387 mg/dL), secondary hypercholesterolaemia, unstable CVD, FH, lipid-altering or antiarrhythmic drugs, hepatic dysfunction, statin hypersensitivity drugs associated with rhabdomyolysis in combination with statins Atorvastatin baseline TC: 7.25 mmol/L (280 mg/dL) Atorvastatin baseline LDL-C: 5.19 mmol/L (201 mg/dL) Atorvastatin baseline HDL-C: 1.21 mmol/L (46.79 mg/dL) Atorvastatin baseline TG: 1.87 mmol/L (166 mg/dL)
Interventions	Atorvastatin 20 mg/d Atorvastatin conditional titration of 40 mg/d for 12 to 52 weeks

Atorvastatin for lowering lipids (Review)

3T study 2003 (Continued)

Simvastatin 20 mg/d
 Simvastatin conditional titration of 40 mg/d for 12 to 52 weeks

Outcomes	% change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer Inc funded the study; Pfizer manufactures and markets atorvastatin

ACCESS 2001

Methods	4-Week dietary lead-in phase 54-Week open-label randomised parallel multi-centre study
Participants	3916 participants throughout the USA with type IIA and IIB hypercholesterolaemia were randomly assigned in a 4:1:1:1 ratio, but 131 participants were excluded from the ITT group because they did not take at least 1 dose of study medication or had a valid efficacy evaluation at baseline and post baseline, that is, 3785 participants formed the basis for the ITT efficacy analysis. 1902 received atorvastatin, 477 received fluvastatin, 476 received lovastatin, 462 received pravastatin and 468 received simvastatin LDL-C 130 to 350 mg/dL (3.36-9.05 mmol/L), TG < 400 mg/dL (4.52 mmol/L) Atorvastatin baseline TC: 6.83 mmol/L (264 mg/dL) Atorvastatin baseline LDL-C: 4.60 mmol/L (178 mg/dL) Atorvastatin baseline HDL-C: 1.24 mmol/L (48 mg/dL) Atorvastatin baseline TG: 2.15 mmol/L (190 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 6 weeks Atorvastatin conditional titration of 20 mg/d for 6 to 12 weeks

Atorvastatin for lowering lipids (Review)

ACCESS 2001 (Continued)

Atorvastatin conditional titration of 40 mg/d for 12 to 18 weeks
 Atorvastatin conditional titration of 80 mg/d for 18 to 54 weeks
 Fluvastatin 10 mg/d for 0 to 6 weeks
 Fluvastatin conditional titration of 20 mg/d for 6 to 12 weeks
 Fluvastatin conditional titration of 40 mg/d for 12 to 18 weeks
 Fluvastatin conditional titration of 80 mg/d for 18 to 54 weeks
 Lovastatin 10 mg/d for 0 to 6 weeks
 Lovastatin conditional titration of 20 mg/d for 6 to 12 weeks
 Lovastatin conditional titration of 40 mg/d for 12 to 18 weeks
 Lovastatin conditional titration of 80 mg/d for 18 to 54 weeks
 Pravastatin 10 mg/d for 0 to 6 weeks
 Pravastatin conditional titration of 20 mg/d for 6 to 12 weeks
 Pravastatin conditional titration of 40 mg/d for 12 to 54 weeks
 Simvastatin 10 mg/d for 0 to 6 weeks
 Simvastatin conditional titration of 20 mg/d for 6 to 12 weeks
 Simvastatin conditional titration of 40 mg/d for 12 to 54 weeks

Outcomes	Per cent change from baseline in serum TC, LDL-C, HDL-C and TG at 6 weeks
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	13/1902 had no TC and TG data 14/1902 had no LDL-C and HDL-C data 0.7% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer Inc funded the study; Pfizer manufactures and sells atorvastatin

Atorvastatin for lowering lipids (Review)

ADVOCATE 2003

Methods	6-Week wash-out period 16-Week multi-centre randomised open-label study Evening dose
Participants	315 men and women from the USA; mean age 51.6 years (18-70) 82 participants received atorvastatin, 157 received niacin ER/lovastatin, 76 received simvastatin; LDL-C \geq 130 mg/dL (3.36 mmol/L), TG < 300 mg/dL (3.39 mmol/L), HDL-C < 50 mg/dL (1.29 mmol/L) Exclusion criteria: unstable CVD, alcohol abuse, drug abuse, uncontrolled mental disease, gall bladder disease, uncontrolled HTN, renal dysfunction, hepatic dysfunction, gout, peptic ulcer disease, fibromyalgia, cancer or other signs that could affect the study procedure or medications Atorvastatin baseline TC: 6.95 mmol/L (269 mg/dL) Atorvastatin baseline LDL-C: 5.07 mmol/L (196 mg/dL) Atorvastatin baseline HDL-C: 0.98 mmol/L (37.90mg/dL) Atorvastatin baseline TG: 1.99 mmol/L (176 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 8 weeks Atorvastatin 20 mg/d for 8 to 12 weeks Atorvastatin 40 mg/d for 12 to 16 weeks Simvastatin 10 mg/d for 0 to 8 weeks Simvastatin 20 mg/d for 8 to 12 weeks Simvastatin 40 mg/d for 12 to 16 weeks Niacin ER/lovastatin groups
Outcomes	Per cent change from baseline at 8 weeks of serum LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed SDs were imputed. TG data were not included because per cent change from baseline was expressed as a median

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported

ADVOCATE 2003 (Continued)

Selective reporting (reporting bias)	High risk	No TC lipid data were reported
Other bias	Unclear risk	Kos Pharmaceuticals funded the study; Kos markets simvastatin/niacin extended release; data may be biased against atorvastatin

Alaupovic 1997

Methods	6-Week wash-out period 24-Week multi-centre open-label treatment period
Participants	46 men and women from Canada with elevated serum cholesterol and TG levels, aged 50 years; BMI < 33 (18-80), TC > 5.2 mmol/L (201 mg/dL), TG > 2.3 mmol/L (203.7 mg/dL) Exclusion criteria: women who are likely to become pregnant, active liver disease, kidney disease, uncontrolled HTN, diabetes, > 10 alcoholic drinks/wk, drug abuse, E2/E2 phenotype Baseline TC: 7.45 mmol/L (288 mg/dL) Baseline LDL-C: 4.60 mmol/L (178 mg/dL) Baseline HDL-C: 0.9 mmol/L (34.8 mg/dL) Baseline TG: 4.53 mmol/L (401 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 12 weeks Atorvastatin 20 mg/d for 12 to 24 weeks
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may be biased for atorvastatin

Almroth 2009

Methods	<p>Wash-out period was not required because individuals receiving ongoing treatment with lipid-lowering drugs were excluded</p> <p>1-Month multi-centre double-blind randomised placebo-controlled trial</p>
Participants	<p>234 men and women from Sweden with atrial fibrillation; cardioversion was performed on participants during the study; mean age 65 years (18-80)</p> <p>Exclusion criteria: patients with paroxysmal atrial fibrillation, atrial flutter, contraindications against atorvastatin, ongoing treatment with Class I or Class III antiarrhythmics, oral amiodarone < 6 months before inclusion, known liver disease or a myopathy, patients with previous electrical CV < 1 year</p> <p><u>Placebo:</u></p> <p>Baseline TC: 5.35 mmol/L (207 mg/dL) Baseline LDL-C: 3.13 mmol/L (121 mg/dL) Baseline HDL-C: 1.32 mmol/L (51 mg/dL) Baseline TG: 1.58 mmol/L (140 mg/dL)</p> <p><u>Atorvastatin:</u></p> <p>Baseline TC: 5.21 mmol/L (201 mg/dL) Baseline LDL-C: 3.19 mmol/L (123 mg/dL) Baseline HDL-C: 1.26 mmol/L (48.7 mg/dL) Baseline TG: 1.67 mmol/L (150 mg/dL)</p>
Interventions	<p>Placebo</p> <p>Atorvastatin 80 mg/d</p>
Outcomes	Per cent change from baseline at 1 month of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed; WDAEs were reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	"Made a computer-generated randomization list using blocks of six"
Allocation concealment (selection bias)	Low risk	<p>"Participating centres received medical preparations distributed from the hospital pharmacy in Huddinge that was not involved in the randomization and packing procedure"</p> <p>"Placebo tablets were identical in size, taste, and weight to the atorvastatin tablets"</p>
Blinding (performance bias and detection bias) All outcomes	Low risk	"Assigned therapy was fully blinded"
Incomplete outcome data (attrition bias) All outcomes	Low risk	<p>5/116 discontinued placebo (4.3%)</p> <p>7/118 discontinued atorvastatin (6%); participants were not analysed for efficacy</p>
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured

Atorvastatin for lowering lipids (Review)

Almroth 2009 (Continued)

WDAEs were reported

Other bias	High risk	Pfizer funded the study through an unrestricted grant; data may support bias for the drug
------------	-----------	---

ALPIN 2004

Methods	4-Week run-in phase 8-Week multi-centre double-blind randomised parallel placebo-controlled study
Participants	41 men and women aged > 35 and ≤ 75 years with type 2 diabetes who had never had a major adverse cardiac event diagnosed or who had experienced a major adverse cardiac event that had been diagnosed at least 6 months before the study; participants had not received any hyperlipidaemic therapy. For 4 participants, the concentration of apoB in small dense LDL was not available at visit 4; therefore the full analysis set consisted of 37 participants, 25 in the atorvastatin group and 12 in the placebo group, for the efficacy analysis. 41 participants were included in the safety analysis Exclusion criteria: none No baseline lipid values
Interventions	Placebo Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	WDAEs were reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Placebo group: 1/13 were excluded Atorvastatin group: 3/28 were excluded 4/41 (9.8%) participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	The study was terminated prematurely because of difficulties with participant recruitment

Amudha 2008

Methods	<p>Wash-out period was not required because individuals receiving lipid-lowering agents were excluded from the study</p> <p>4-Week double-blind randomised placebo-controlled trial</p>
Participants	<p>56 men and women from Malaysia aged 18 to 30 years; BMI < 25 and a history of type 2 diabetes mellitus in 1 or both parents</p> <p>Exclusion criteria: individuals with severe dyslipidaemia, CVD, chronic renal disease; individuals who smoked during the previous 6 months; childbearing potential; individuals receiving antihypertensives, glucocorticoids, antineoplastic agents, psychoactive agents and bronchodilators</p> <p><u>Placebo:</u></p> <p>Baseline TC: 4.9 mmol/L (189 mg/dL) Baseline LDL-C: 3.2 mmol/L (124 mg/dL) Baseline HDL-C: 1.2 mmol/L (46.4 mg/dL) Baseline TG: 1.5 mmol/L (133 mg/dL)</p> <p><u>Atorvastatin:</u></p> <p>Baseline TC: 5.0 mmol/L (193 mg/dL) Baseline LDL-C: 3.3 mmol/L (128 mg/dL) Baseline HDL-C: 1.1 mmol/L (42.5 mg/dL) Baseline TG: 1.7 mmol/L (151 mg/dL)</p>
Interventions	<p>Placebo</p> <p>Atorvastatin 80 mg/d</p>
Outcomes	Per cent change from baseline at 1 month of serum TC, LDL-C, HDL-C and TG
Notes	<p>SDs were imputed</p> <p>WDAEs were not reported</p>

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Atorvastatin for lowering lipids (Review)

Anagnostis 2011

Methods	No participant received lipid-altering agents; no wash-out period was required 12-Week randomised open-label trial
Participants	36 men and women with dyslipidaemia 18 participants received atorvastatin, 18 received rosuvastatin Exclusion criteria: diabetes mellitus, cancer, thyroid dysfunction, any lipid-lowering agents or anti-obesity agents Atorvastatin baseline TC: 7.03 mmol/L (272 mg/dL) Atorvastatin baseline LDL-C: 4.73 mmol/L (183 mg/dL) Atorvastatin baseline HDL-C: 1.50 mmol/L (58 mg/dL) Atorvastatin baseline TG: 1.885 mmol/L (167 mg/dL)
Interventions	Atorvastatin 20 mg/d Rosuvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4-12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin treatment arm was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	Unclear risk	The source of funding was not reported

ANDROMEDA 2007

Methods	4-Week wash-out period 8-Week multi-centre randomised double-blind parallel-group treatment period
---------	---

Atorvastatin for lowering lipids (Review)

ANDROMEDA 2007 (Continued)

Participants	509 men and women from the UK at least 18 years of age with type 2 diabetes mellitus; 255 participants received atorvastatin, 254 received rosuvastatin; TG < 6.1 mmol/L Exclusion criteria: type 1 diabetes, glycated haemoglobin > 9.0%, CVD history or FH, ALT or AST > 1.4 (ULN), resting DBP or SBP > 95 mmHg or 200 mmHg, CK level > 3 × ULN Atorvastatin baseline TC: 5.5 mmol/L (213 mg/dL) Atorvastatin baseline LDL-C: 3.4 mmol/L (132 mg/dL) Atorvastatin baseline HDL-C: 1.2 mmol/L (46.4 mg/dL) Atorvastatin baseline TG: 4.53 mmol/L (186 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 8 weeks Atorvastatin 20 mg/d for 8 to 16 weeks Rosuvastatin 10 mg/d for 0 to 8 weeks Rosuvastatin 20 mg/d for 8 to 16 weeks
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed TG SD was imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was available for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	240/255 were included in the ITT efficacy analysis at Week 8. 15/255 were not included. 6% of participants were not evaluated
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Ansquer 2009

Methods	4-Week to 6-week wash-out dietary stabilisation period 12-Week open-label randomised parallel-group study
Participants	165 men and women aged 18 to 79 years with type II primary dyslipidaemia; LDL-C ≥ 160 mg/dL (4.14 mmol/L), TG 150 to 400 mg/dL (1.69-4.52 mmol/L)

Atorvastatin for lowering lipids (Review)

Ansquer 2009 (Continued)

81 participants received atorvastatin, 84 received fenofibrate

Exclusion criteria: type I, III, IV, V dyslipidaemia; diabetes mellitus, pancreatitis, gall bladder disease, peptic ulcer disease, MI, cerebrovascular accident, unstable angina pectoris history or any severe life-threatening disease, AST or ALT > 2 × ULN, gamma-glutamyl transpeptidase > 2 × ULN, CK > 2 × ULN, creatinine > 133 μmol/L (1.5 mg/dL), TSH > 4 μIU/L, HRT; use of thiazides, steroids, retinoids, anti-vitamin K, cyclosporine, erythromycin, digoxin or antifungal drugs; pregnancy or breastfeeding

Atorvastatin baseline TC: 7.54 mmol/L (292 mg/dL)
 Atorvastatin baseline LDL-C: 5.19 mmol/L (201 mg/dL)
 Atorvastatin baseline HDL-C: 1.20 mmol/L (46 mg/dL)
 Atorvastatin baseline TG: 2.50 mmol/L (221 mg/dL)

Interventions	Atorvastatin 10 mg/d Fenofibrate 200 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	3 of the investigators were employees of Solvay Pharmaceuticals Company, which manufactures fenofibrate

Arazi 2008

Methods	4-Week wash-out dietary baseline stabilisation period 4-Week open-label study
Participants	59 unrelated Brazilian men and women outpatients aged 31 to 77 years with hypercholesterolaemia and LDL-C > 4 mmol/L (154.7 mg/dL) were treated with atorvastatin Exclusion criteria: gastrointestinal, thyroid, liver or renal disease; diabetes; familial dyslipidaemia TG > 4.4 mmol/L (389.7 mg/dL); under treatment with lipid-lowering drugs, HRT or oral contraceptives

Atorvastatin for lowering lipids (Review)

Arazi 2008 (Continued)

Baseline TC: 6.76 mmol/L (261 mg/dL)
 Baseline LDL-C: 4.55 mmol/L (176 mg/dL)
 Baseline HDL-C: 1.46 mmol/L (56.5 mg/dL)
 Baseline TG: 1.60 mmol/L (142 mg/dL)

Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	-

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study seems to be free of other bias

Arca 2007a

Methods	6-Week dietary wash-out phase 24-Week randomised open-label study
Participants	56 men and women with familial combined hyperlipidaemia, between 30 and 75 years old; TC and/or TG levels \geq those of age- and sex-specific 90th Italian population percentiles, hyperapobetalipoproteinaemia (apo B >130 mg/dL). Only families with at least 2 affected members presenting different lipid phenotypes were enrolled 27 participants received atorvastatin, 29 received fenofibrate Exclusion criteria: type III hyperlipidaemia, apo E2/E2 genotype, obesity, poorly controlled diabetes mellitus, those taking lipid-affecting drugs Atorvastatin baseline TC: 6.68 mmol/L (258 mg/dL) Atorvastatin baseline LDL-C: 4.30 mmol/L (166 mg/dL) Atorvastatin baseline HDL-C: 1.16 mmol/L (45 mg/dL) Atorvastatin baseline TG: 2.70 mmol/L (239 mg/dL)

Atorvastatin for lowering lipids (Review)

Arca 2007a (Continued)

Interventions	Atorvastatin 10 mg/d for 0 to 6 weeks Atorvastatin conditional titration of 20 mg/d for 6 to 12 weeks Atorvastatin conditional titration of 40 mg/d for 12 to 18 weeks Atorvastatin conditional titration of 80 mg/d for 18 to 24 weeks Fenofibrate 200 mg/d for 0 to 24 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer partially funded the study; data may support bias for atorvastatin

Arca 2007b

Methods	6-Week dietary wash-out phase 24-Week randomised open-label study
Participants	45 men and women with familial combined hyperlipidaemia 23 participants received atorvastatin, 22 received fenofibrate Exclusion criteria: thyroid and liver disease, renal dysfunction, obesity, poorly controlled diabetes mellitus, those taking lipid-affecting drugs Atorvastatin baseline TC: 6.66 mmol/L (258 mg/dL) Atorvastatin baseline LDL-C: 4.42 mmol/L (171 mg/dL) Atorvastatin baseline HDL-C: 1.26 mmol/L (49 mg/dL) Atorvastatin baseline TG: 2.13 mmol/L (189 mg/dL)

Atorvastatin for lowering lipids (Review)

Arca 2007b (Continued)

Interventions	Atorvastatin 10 mg/d at 0 to 6 weeks Atorvastatin conditional titration of 20 mg/d for 6 to 12 weeks Atorvastatin conditional titration 40 mg/d for 12 to 18 weeks Atorvastatin conditional titration 80 mg/d for 18 to 24 weeks Fenofibrate 200 mg/d for 0 to 24 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin 10 mg/d at 0 to 6 weeks; treatment arm was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer partially funded the study; data may support bias for atorvastatin

ARIES 2006

Methods	6-Week dietary wash-out stabilisation period 6-Week randomised open-label multi-centre treatment period
Participants	774 African American men and women > 17 years with type IIa and IIb hypercholesterolaemia; LDL-C 160 to 300 mg/dL (4.14-7.76 mmol/L), TG < 400 mg/dL (4.5 mmol/L) 383 participants received atorvastatin, 391 received rosuvastatin Exclusion criteria: homozygous type I, III or V hyperlipoproteinaemia; active arterial disease, uncontrolled HTN, poorly controlled diabetes, liver and renal dysfunction Atorvastatin baseline TC: 6.97 mmol/L (269 mg/dL) Atorvastatin baseline LDL-C: 4.89 mmol/L (189 mg/dL) Atorvastatin baseline HDL-C: 1.35 mmol/L (52.2 mg/dL) Atorvastatin baseline TG: 1.57 mmol/L (139 mg/dL)

Atorvastatin for lowering lipids (Review)

ARIES 2006 (Continued)

Interventions	Atorvastatin 10 mg/d for 0 to 6 weeks Atorvastatin 20 mg/d for 0 to 6 weeks Rosuvastatin 10 mg/d for 0 to 6 weeks Rosuvastatin 20 mg/d for 0 to 6 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin groups were analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d and 20 mg/d; treatment arms were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d and 20 mg/d; treatment arms were analysed, and as no placebo group was included for comparison assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d and 20 mg/d; treatment arms were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin 10 mg group: 179/191 were included in the ITT efficacy analysis Atorvastatin 20 mg group: 178/192 were included in the ITT efficacy analysis Atorvastatin group: 357/383 were included in the ITT efficacy analysis 6.8% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

ASSET 2001

Methods	8-Week wash-out period 54-Week multi-centre randomised open-label parallel-arm treat-to-target study
Participants	1424 men and women from the USA with mixed dyslipidaemia; mean age 61 years (18-80) with and without CHD/peripheral vascular disease and with or without type 2 diabetes; TG 2.26 to 6.77 mmol/L (200-600 mg/dL), LDL-C 3.36 to 9.05 mmol/L (130-350 mg/dL) Exclusion criteria: hepatic and renal dysfunction, uncontrolled hypothyroidism, statin hypersensitivity, lipid-altering medications, MI, revascularisation procedures, unstable angina, significant medical or psychological disorders. 730 received atorvastatin and 694 received simvastatin Atorvastatin baseline TC: 7.36 mmol/L (285 mg/dL) Atorvastatin baseline LDL-C: 4.69 mmol/L (181 mg/dL) Atorvastatin baseline HDL-C: 1.11 mmol/L (42.92 mg/dL) Atorvastatin baseline TG: 3.43 mmol/L (304 mg/dL)

Atorvastatin for lowering lipids (Review)

ASSET 2001 (Continued)

Interventions	Atorvastatin 10 mg/d Simvastatin 10 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	6 weeks: 18/730 were excluded for reasons such as "not safely evaluable, missing LDL cholesterol data at baseline or after randomization, study medication was discontinued for >48 hours before blood withdrawal" 2.5% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer Inc funded the study; Pfizer manufactures and sells atorvastatin; data may be biased towards atorvastatin

AstraZeneca 2010

Methods	4-Week dietary wash-out period 6-Week before-and-after study
Participants	146 men and women with hypercholesterolaemia aged 18 years or older LDL-C \geq 3.36 mmol/L (130 mg/dL) and $<$ 6.50 mmol/L (250 mg/dL), fasting TG $<$ 4.52 mmol/L (400 mg/dL) and a history of CHD or a CHD risk equivalent, or clinical evidence of atherosclerosis or 10-year CHD risk \geq 10% Exclusion criteria: none Atorvastatin baseline LDL-C: 4.21 mmol/L (169 mg/dL) Atorvastatin baseline TG: 2.06 mmol/L (182.5 mg/dL)
Interventions	Atorvastatin 10 mg/d

Atorvastatin for lowering lipids (Review)

AstraZeneca 2010 (Continued)

Rosuvastatin 5 mg/d for 0 to 6 weeks

Rosuvastatin 5 to 10 mg/d for 6 to 12 weeks

Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	7/146 = 4.8% were not included in the efficacy analysis
Selective reporting (reporting bias)	High risk	Total cholesterol and HDL-cholesterol data were not reported
Other bias	High risk	AstraZeneca funded the trial

ASTRO-2 2009

Methods	No wash-out was required because participants were not receiving any lipid-altering agents for at least 2 months 8-Week open-label randomised study
Participants	877 men and women aged > 20 years with hypercholesterolaemia 442 randomly assigned to rosuvastatin 5 mg/d 435 randomly assigned to atorvastatin 10 mg/d Exclusion criteria: severe hypertension, type 1 diabetes mellitus, familial hypercholesterolaemia, fasting TG > 400 mg/dL, MI or cerebrovascular disorder within 3 months before the start of the study, serious cardiac insufficiency, revascularisation during the study period, active hepatic disease, renal dysfunction, pregnancy or possible pregnancy, hypothyroidism, muscle disease, drug and alcohol abuse Atorvastatin baseline LDL-C: 4.38 mmol/L (169 mg/dL) Atorvastatin baseline HDL-C: 1.57 mmol/L (61 mg/dL) Atorvastatin baseline TG: 1.46 mmol/L (129 mg/dL)
Interventions	Rosuvastatin 5 mg/d

Atorvastatin for lowering lipids (Review)

ASTRO-2 2009 (Continued)

Atorvastatin 10 mg/d

Outcomes	Per cent change from baseline at 4 to 8 weeks of plasma LDL-C, HDL-C and triglycerides
Notes	Rosuvastatin 5 mg/d data were not analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	3/435 (0.7%) participants were not included in the efficacy analysis
Selective reporting (reporting bias)	High risk	TC was not included in the efficacy analysis
Other bias	Low risk	Industry did not fund the trial

Atalar 2002

Methods	6-Week dietary stabilisation period 12-Week open-label study
Participants	36 men and women with hyperlipidaemia with stable CAD; mean age 53 years; TC > 200 mg/dL, LDL-C > 130 mg/dL Exclusion criteria: MI within 12 weeks, CABG surgery within 6 months, unstable angina, ongoing infection, diabetes mellitus, cancer, chronic liver disease, renal insufficiency, hypothyroidism, connective tissue disease, obesity, childbearing potential, treatment with anti-inflammatory or anticoagulant drugs Baseline TC: 6.70 mmol/L (259 mg/dL) Baseline LDL-C: 4.58 mmol/L (177 mg/dL) Baseline HDL-C: 1.22 mmol/L (47 mg/dL) Baseline TG: 1.91 mmol/L (169 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Atorvastatin for lowering lipids (Review)

Atalar 2002 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

ATLANTIKA 2008

Methods	4-Week dietary baseline stabilisation period 24-Week randomised open-label trial
Participants	<p>697 men and women 18 to 75 years of age with CHD, dyslipidaemia and type 2 diabetes mellitus; LDL-C > 2.5 mmol/L (97 mg/dL); HDL-C < 1 mmol/L (39 mg/dL) in men and < 1.3 mmol/L (50.3 mg/dL) in women; TG ≥ 1.7 mmol/L (151 mg/dL); BP ≥ 130/85 mmHg</p> <p>237 participants received atorvastatin 10 mg/d for 0 to 24 weeks; 234 received atorvastatin 10 mg/d for 0 to 4 weeks, then titrated atorvastatin from 20 mg/d to 80 mg/d for 4 to 24 weeks; 226 received common therapy, which could include lipid-lowering drugs</p> <p>Exclusion criteria: TG > 4.5 mmol/L (399 mg/dL), TC > 8.0 mmol/L (309 mg/dL); secondary hyperlipidaemia due to uncontrolled hypothyroidism, nephrotic syndrome, type 1 diabetes mellitus, gall bladder disease, biliary disease, pancreatitis, active liver disease, renal dysfunction; AST, ALT and γ-glutamylaminopeptidase are 2 × ULN, CK is 5 × ULN; acute illness within 1 month of screening, type III and IV hypercholesterolaemia; women who were pregnant or lactating; participants who were participating in another trial or were taking medication that affects serum lipids</p> <p>Group A atorvastatin TC: 6.47 mmol/L (250 mg/dL)</p> <p>Group A atorvastatin LDL-C: 4.30 mmol/L (166 mg/dL)</p> <p>Group A atorvastatin HDL-C: 1.35 mmol/L (52 mg/dL)</p> <p>Group A atorvastatin TG: 1.76 mmol/L (156 mg/dL)</p> <p>Group B atorvastatin TC: 6.30 mmol/L (244 mg/dL)</p> <p>Group B atorvastatin LDL-C: 4.18 mmol/L (162 mg/dL)</p> <p>Group B atorvastatin HDL-C: 1.29 mmol/L (50 mg/dL)</p>

Atorvastatin for lowering lipids (Review)

ATLANTIKA 2008 (Continued)

Group B atorvastatin TG: 1.82 mmol/L (161 mg/dL)

Groups A + B atorvastatin baseline TC: 6.39 mmol/L (247 mg/dL)

Groups A + B atorvastatin baseline LDL-C: 4.24 mmol/L (164 mg/dL)

Groups A + B atorvastatin baseline HDL-C: 1.32 mmol/L (51 mg/dL)

Groups A + B atorvastatin baseline TG: 1.79 mmol/L (159 mg/dL)

Interventions	Group A atorvastatin 10 mg for 0 to 12 weeks Group B atorvastatin 10 mg for 0 to 4 weeks Atorvastatin 20 mg for 4 to 8 weeks Atorvastatin 40 mg for 8 to 12 weeks Atorvastatin 80 mg for 12 to 24 weeks Group C common therapy, which could include lipid-lowering drugs
Outcomes	Per cent change from baseline at 4 to 12 weeks of LDL-C
Notes	First atorvastatin dose was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Group A atorvastatin 10 mg for 0 to 12 weeks and Group B atorvastatin 10 mg for 0 to 4 weeks; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Group A atorvastatin 10 mg for 0 to 12 weeks and Group B atorvastatin 10 mg for 0 to 4 weeks; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Group A atorvastatin 10 mg for 0 to 12 weeks and Group B atorvastatin 10 mg for 0 to 4 weeks; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	Group A: 21/237 were missing Group B: 27/234 were missing 48/471 were not included in the efficacy analysis 10% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	High risk	No data for TC, HDL-C and TG at 4 to 12 weeks
Other bias	Low risk	The study appears to be free of other sources of bias

ATOROS 2006

Methods	6-Week wash-out period
---------	------------------------

Atorvastatin for lowering lipids (Review)

ATOROS 2006 (Continued)

24-Week single-centre open-label randomised parallel-group study

Participants	<p>120 men and women from Greece with primary hyperlipidaemia; mean age 53 years; TC > 240 mg/dL (6.2 mmol/L), TG < 350 mg/dL (4.0 mmol/L)</p> <p>60 participants received atorvastatin 20 mg/d, 60 received rosuvastatin 20 mg/d</p> <p>Exclusion criteria: hepatic dysfunction, renal dysfunction, diabetes mellitus, hyperthyroidism, medical conditions that threaten study protocol completion</p> <p>Atorvastatin baseline TC: 7.37 mmol/L (285 mg/dL)</p> <p>Atorvastatin baseline LDL-C: 5.28 mmol/L (204 mg/dL)</p> <p>Atorvastatin baseline HDL-C: 1.24 mmol/L (48 mg/dL)</p> <p>Atorvastatin baseline TG: 1.77 mmol/L (157 mg/dL)</p>
Interventions	<p>Atorvastatin 20 mg/d for 0 to 6 weeks</p> <p>Atorvastatin conditional titration of 40 mg/d for weeks 6 to 24</p> <p>Rosuvastatin 20 mg/d for 0 to 6 weeks</p> <p>Rosuvastatin conditional titration of 40 mg/d for weeks 6 to 24</p>
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	<p>First atorvastatin dose was analysed</p> <p>SDs were imputed</p>

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d for 0 to 6 weeks; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d for 0 to 6 weeks; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d for 0 to 6 weeks; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

AVALON 2006

Methods	<p>2-Week to 6-week wash-out period</p> <p>8-Week multi-centre double-blind double-dummy randomised placebo-controlled study</p>
---------	--

Atorvastatin for lowering lipids (Review)

AVALON 2006 (Continued)

Participants	<p>848 men and women from the USA and Canada aged 18 to 75 years of any ethnicity with HTN and dyslipidaemia were randomly assigned; 847 took at least 1 dose of the study medication</p> <p>239 participants received placebo, 200 received atorvastatin 10 mg/d, 201 received amlodipine 5 mg/d, 207 received atorvastatin 10 mg/d + amlodipine 5 mg/d</p> <p>Exclusion criteria: calcium channel blocker and statin intolerance, pregnancy or lactation, hepatic and renal dysfunction, serious cardiovascular problems within 3 to 6 months of screening, secondary dyslipidaemia or HTN of any aetiology, diabetes mellitus or disorders that would interfere with study</p> <p>Placebo baseline LDL-C: 4.22 mmol/L (163 mg/dL)</p> <p>Atorvastatin baseline LDL-C: 4.18 mmol/L (162 mg/dL)</p>
Interventions	<p>Placebo amlodipine and placebo atorvastatin for 0 to 8 weeks</p> <p>Placebo amlodipine and atorvastatin 10 mg/d for 0 to 8 weeks</p> <p>Amlodipine 5 mg/d and placebo atorvastatin for 0 to 8 weeks</p> <p>Amlodipine 5 mg/d + atorvastatin 10 mg/d for 0 to 8 weeks</p> <p>Amlodipine 5 mg/d + atorvastatin 10 mg/d for 8 to 16 weeks</p> <p>Amlodipine 5 to 10 mg/d + atorvastatin 10 to 80 mg/d for 16 to 28 weeks</p>
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	<p>Placebo and atorvastatin monotherapy groups were analysed</p> <p>WDAEs were reported</p>

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Phase one was an 8-week, double-blind, double-dummy"
Incomplete outcome data (attrition bias) All outcomes	Low risk	<p>Placebo: 10/239 were not included in the ITT efficacy analysis</p> <p>Atorvastatin: 7/200 were not included in the ITT efficacy analysis</p> <p>4% of participants were not included in the ITT efficacy analysis</p>
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer Inc funded the study; Pfizer markets atorvastatin; data may be biased towards atorvastatin

Bach-Ngohou 2005

Methods	None were taking any medication that could affect lipids for at least 2 months before the study 8-Week open-label study
Participants	7 men and women with type 2 diabetes mellitus with mixed dyslipidaemia aged 47 to 65 years; 169 mg/dL < TG < 670 mg/dL (219 mg/dL < TC < 321 mg/dL) Baseline TC: 6.97 mmol/L (270 mg/dL) Baseline LDL-C: 4.26 mmol/L (165 mg/dL) Baseline HDL-C: 1.22 mmol/L (47 mg/dL) Baseline TG: 3.84 mmol/L (340 mg/dL)
Interventions	Atorvastatin 40 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Number of participants was small (7). Pfizer funded the study; data may be biased towards atorvastatin

Bahadir 2009

Methods	No wash-out period was required; participants were not taking any medication that would affect lipid metabolism 8-Week open-label study
Participants	12 men and women with hypercholesterolaemia and metabolic syndrome aged ≥ 30 years; TG ≥ 150 mg/dL, HDL-C < 40 mg/dL Baseline TC: 6.35 mmol/L (246 mg/dL) Baseline LDL-C: 4.17 mmol/L (161 mg/dL) Baseline HDL-C: 1.17 mmol/L (45 mg/dL)

Atorvastatin for lowering lipids (Review)

Bahadir 2009 (Continued)

Baseline TG: 2.37 mmol/L (210 mg/dL)

Exclusion criteria: patients with severe renal disease or renal dysfunction, liver disease, inflammatory muscle disease, CVD, cancer except non-melanoma skin cancer, antidiabetic treatment modification within the past 3 months, conditions known to influence metabolism or immunity, drug and substance dependency and a history of stroke or coronary syndrome within the past 3 months

Interventions	Atorvastatin 20 mg/d Rosuvastatin 10 mg/d Simvastatin 40 mg/d Pravastatin 40 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding for the trial was not reported

Bakker-Arkema 1996

Methods	4-Week wash-out period 4-Week double-blind randomised Placebo-controlled parallel-group multi-centre study Randomisation method: stratified randomisation code based on the mean of the participant's qualifying LDL-C levels
Participants	56 men and women from Canada and the USA with primary hypertriglyceridaemia aged 26 to 74 years; BMI \leq 32, women of non-childbearing potential, 2 total TG values \geq 3.95 mmol/L (350 mg/dL) with the lower value within 30% of the higher value 14 participants received placebo, 13 received atorvastatin 5 mg/d, 16 received atorvastatin 10 mg/d, 12 received atorvastatin 80 mg/d

Atorvastatin for lowering lipids (Review)

Bakker-Arkema 1996 (Continued)

Exclusion criteria: active liver disease, kidney disease, uncontrolled HTN, endocrine disease that affects serum lipids, > 14 alcoholic drinks per week, lipid-altering medications

Placebo baseline TC: 6.78 mmol/L (262 mg/dL)

Placebo baseline LDL-C: 2.98 mmol/L (115 mg/dL)

Placebo baseline HDL-C: 0.80 mmol/L (32 mg/dL)

Placebo baseline TG: 7.04 mmol/L (624 mg/dL)

Atorvastatin 5 mg/d baseline TC: 6.55 mmol/L (253 mg/dL)

Atorvastatin 5 mg/d baseline LDL-C: 3.15 mmol/L (122 mg/dL)

Atorvastatin 5 mg/d baseline HDL-C: 0.84 mmol/L (32 mg/dL)

Atorvastatin 5 mg/d baseline TG: 6.14 mmol/L (544 mg/dL)

Atorvastatin 10 mg/d baseline TC: 7.47 mmol/L (289 mg/dL)

Atorvastatin 10 mg/d baseline LDL-C: 3.19 mmol/L (123 mg/dL)

Atorvastatin 10 mg/d baseline HDL-C: 0.83 mmol/L (32 mg/dL)

Atorvastatin 10 mg/d baseline TG: 7.44 mmol/L (659 mg/dL)

Atorvastatin 80 mg/d baseline TC: 6.82 mmol/L (264 mg/dL)

Atorvastatin 80 mg/d baseline LDL-C: 2.79 mmol/L (108 mg/dL)

Atorvastatin 80 mg/d baseline HDL-C: 0.80 mmol/L (31 mg/dL)

Atorvastatin 80 mg/d baseline TG: 6.62 mmol/L (586 mg/dL)

Interventions	Placebo Atorvastatin 5 mg/d Atorvastatin 10 mg/d Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	WDAEs not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Insufficient information about the sequence generation process was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	Insufficient information about the method of allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported

Bakker-Arkema 1996 (Continued)

Selective reporting (reporting bias)	Low risk	All primary objective parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may be biased towards atorvastatin

Balakhonova 2002

Methods	4-Week baseline dietary stabilisation period 12-Week open-label trial
Participants	16 men and women aged 32 to 63 years with type 2a hypercholesterolaemia; LDL-C \geq 7 mmol/L (271 mg/dL), TG \leq 4 mmol/L (354 mg/dL) Exclusion criteria: statin hypersensitivity, diabetes mellitus, unstable angina, uncontrolled HTN with BP > 150/100 mmHg, active liver disease, active kidney disease, serum liver enzymes > 20% ULN, women receiving HRT Baseline TC: 10.7 mmol/L (415 mg/dL) Baseline LDL-C: 8.6 mmol/L (333 mg/dL) Baseline HDL-C: 1.4 mmol/L (54 mg/dL) Baseline TG: 1.5 mmol/L (133 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Ballantyne 2004

Methods	20-Week wash-out period 24-Week multi-centre double-blind randomised study Evening dose
Participants	788 men and women from the USA aged > 17 years with hypercholesterolaemia; LDL-C > 130 mg/dL (3.36 mmol/L), TG < 350 mg/dL (3.95 mmol/L) 262 received atorvastatin, 526 received Vytorin + simvastatin Exclusion criteria: no active liver disease or renal disease Atorvastatin baseline TC: 6.90 mmol/L (268 mg/dL) Atorvastatin baseline LDL-C: 4.67 mmol/L (118 mg/dL) Atorvastatin baseline HDL-C: 1.21 mmol/L (31.71 mg/dL)
Interventions	Atorvastatin 10 mg/d for weeks 0 to 6 Atorvastatin 20 mg/d for weeks 6 to 12 Atorvastatin 40 mg/d for weeks 12 to 18 Atorvastatin 80 mg/d for weeks 18 to 24 Vytorin + simvastatin 10 mg/d for weeks 0 to 6 Vytorin + simvastatin 20 mg/d for weeks 6 to 12 Vytorin + simvastatin 40 mg/d for weeks 12 to 18 Vytorin + simvastatin 80 mg/d for weeks 18 to 24 Vytorin + simvastatin 20 mg/d for weeks 0 to 6 Vytorin + simvastatin 40 mg/d for weeks 6 to 12 Vytorin + simvastatin 40 mg/d for weeks 12 to 18 Vytorin + simvastatin 80 mg/d for weeks 18 to 24
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C and HDL-C
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias)	Low risk	Data on all participants were reported

Atorvastatin for lowering lipids (Review)

Ballantyne 2004 (Continued)

All outcomes

Selective reporting (reporting bias)	High risk	No TG data were reported because reported values were median values
Other bias	High risk	Merck funded the study; data may support bias against atorvastatin

Barter 2000

Methods	4-Week wash-out period 6-Week open-label randomised parallel-group multi-centre study Evening dose
Participants	1028 men and women from Australia aged 18 to 75 years with hypercholesterolaemia; TC > 5.5 mmol/L (213 mg/dL), HDL-C < 1.0 mmol/L (39 mg/dL) 691 participants received atorvastatin, 337 received simvastatin Exclusion criteria: secondary hypercholesterolaemia, CHD symptoms in the previous 3 months, plasma TG > 4.0 mmol/L, ALT or AST > 1.5 × ULN, CK > 3 × ULN, statin hypersensitivities, other conditions precluding completion of study Atorvastatin baseline TC: 7.41 mmol/L (287 mg/dL) Atorvastatin baseline LDL-C: 5.22 mmol/L (202 mg/dL) Atorvastatin baseline HDL-C: 1.23 mmol/L (47.5 mg/dL) Atorvastatin baseline TG: 2.10 mmol/L (186 mg/dL)
Interventions	Atorvastatin 10 mg/d for 6 weeks Atorvastatin conditionally titrated to 20 mg/d for 6 to 12 weeks Atorvastatin conditionally titrated to 40 mg/d for 12 to 18 weeks Atorvastatin conditionally titrated to 80 mg/d for 18 to 24 weeks Simvastatin 10 mg/d for 6 weeks Simvastatin conditionally titrated to 20 mg/d for 6 to 12 weeks Simvastatin conditionally titrated to 40 mg/d for 12 to 18 weeks Simvastatin conditionally titrated to 80 mg/d for 18 to 24 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Barter 2000 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer funded the study; data may support bias in favour of atorvastatin

Bays 2011

Methods	5-Week single-blind placebo wash-out period 8-Week multi-centre double-blind randomised placebo-controlled study
Participants	62 dyslipidaemic obese men and women aged 18 to 75 years; LDL-C 130 to 280 mg/dL, TG 150 to 550 mg/dL, HDL-C no greater than 60 mg/dL 31 participants received placebo, 31 received atorvastatin 20 mg/d Exclusion criteria: patients with diabetes mellitus, CVD, secondary dyslipidaemia <u>Placebo:</u> Baseline TC: 6.51 mmol/L (252 mg/dL) Baseline LDL-C: 4.16 mmol/L (161 mg/dL) Baseline HDL-C: 1.13 mmol/L (44 mg/dL) Baseline TG: 2.87 mmol/L (254 mg/dL) <u>Atorvastatin:</u> Baseline TC: 6.35 mmol/L (246 mg/dL) Baseline LDL-C: 4.27 mmol/L (165 mg/dL) Baseline HDL-C: 1.1 mmol/L (42.5 mg/dL) Baseline TG: 2.26 mmol/L (200 mg/dL)
Interventions	Placebo Atorvastatin 20 mg/d MBX-8025 50 mg/d, 100 mg/d MBX-8025 50 mg/d + atorvastatin 20 mg/d MBX-8025 100 mg/d + atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG; withdrawals due to adverse events
Notes	Placebo and atorvastatin monotherapy groups were analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
------	--------------------	-----------------------

Atorvastatin for lowering lipids (Review)

Bays 2011 (Continued)

Random sequence generation (selection bias)	Unclear risk	Insufficient information about the sequence generation process was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	Insufficient information about the allocation concealment process was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind trial
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Metabolex funded the study; the company makes MBX-8025; data may support bias against atorvastatin

Berthold 2004

Methods	8-Week wash-out period 8-Week multi-centre randomised assignment in blocks of 6; double-blind placebo-controlled trial
Participants	50 menopausal (of at least 2 years) women > 55 years old 25 participants received placebo, 25 received atorvastatin Exclusion criteria: metabolic bone disease, non-postmenopausal bone loss, untreated hyperthyroidism, inadequately treated hypothyroidism, liver disease, elevated serum transaminases > 2 × ULN, kidney disease, severe heart disease, muscular or neuromuscular disease and/or CK > 3 × ULN, cancer, statin intolerance, HRT, use of drugs to affect bone metabolism, diabetes mellitus, smoking, complete lack of exercise Placebo baseline TC: 6.54 mmol/L (253 mg/dL) Placebo baseline LDL-C: 4.27 mmol/L (165 mg/dL) Placebo baseline HDL-C: 1.76 mmol/L (68 mg/dL) Placebo baseline TG: 1.19 mmol/L (105 mg/dL) Atorvastatin baseline TC: 6.44 mmol/L (249 mg/dL) Atorvastatin baseline LDL-C: 4.14 mmol/L (160 mg/dL) Atorvastatin baseline HDL-C: 1.81 mmol/L (70 mg/dL) Atorvastatin baseline TG: 1.22 mmol/L (108 mg/dL)
Interventions	Placebo Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	WDAEs were reported

Risk of bias
Atorvastatin for lowering lipids (Review)

Berthold 2004 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"A multicenter, randomized, double-blind, placebo-controlled trial" "All investigators were blinded to the lipid measurements"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin 20 mg: 1/25 were missing because the study was terminated after 4 weeks as the result of viral bronchitis 2% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Bertolami 2002

Methods	4-Week wash-out period 12-Week multi-centre randomised open treatment period
Participants	157 participants from Brazil with hypertriglyceridaemia and hypercholesterolaemia aged 45 to 65 years; LDL 130 to 250 mg/dL (3.36-6.46 mmol/L), TG < 400 mg/dL (4.52 mmol/L) 107 participants received atorvastatin, 50 received simvastatin Exclusion criteria: statin hypersensitivity, uncontrolled HTN, secondary hyperlipidaemia, aged < 18 or > 80 years, major coronary events, lipid-altering drugs Atorvastatin baseline TC: 7.14 mmol/L (276 mg/dL) Atorvastatin baseline LDL-C: 4.93 mmol/L (191 mg/dL) Atorvastatin baseline HDL-C: 1.27 mmol/L (49.11 mg/dL) Atorvastatin baseline TG: 2.05 mmol/L (182 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 6 weeks Atorvastatin 20 mg/d for 6 to 12 weeks Simvastatin 10 mg/d for 0 to 6 weeks Simvastatin 20 mg/d for 6 to 12 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed SDs were imputed

Atorvastatin for lowering lipids (Review)

Bertolami 2002 (Continued)

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin group: 2/107 were not included in the efficacy analysis Comment: very small number; 2% of participants were not included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Best 1996

Methods	4-Week wash-out period 4-Week open-label Randomised multi-centre; treatment period evening dose
Participants	25 men and women outpatients from Australia with NIDDM with elevated cholesterol; 13 received atorvastatin, 12 received simvastatin; mean age 63 years; LDL \geq 4.1 mmol/L (159 mg/dL) Exclusion criteria: BMI < 20 or > 38, DBP > 95 mmHg; hepatic, renal or thyroid dysfunction; alcohol intake > 140 g/wk, lipid-altering drug intake Atorvastatin baseline TC: 7.10 mmol/L (275 mg/dL) Atorvastatin baseline LDL-C: 4.80 mmol/L (186 mg/dL) Atorvastatin baseline HDL-C: 1.20 mmol/L (46 mg/dL) Atorvastatin baseline TG: 2.20 mmol/L (195 mg/dL)
Interventions	Atorvastatin 10 mg/d Simvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Best 1996 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may be biased in favour of atorvastatin

Bevilacqua 2004

Methods	4-Week wash-out period 3-Month single-centre open-label randomised study via a randomisation list Evening dose
Participants	100 men and women from Italy with NIDDM aged 45 to 71 years; LDL-C 150 to 300 mg/dL (3.9-7.76 mmol/L), HDL-C < 50 mg/dL (1.29 mmol/L), TG > 200 mg/dL (2.256 mmol/L) 50 participants received fluvastatin, 50 received atorvastatin No baseline lipid values were reported Exclusion criteria: surgery, hepatic and renal dysfunction, serious cardiovascular events within 6 months, statin hypersensitivity, poorly controlled HTN, myopathy, alcohol or drug abuse, risk of getting pregnant, oral contraceptive use at study start, lipid-lowering drug intake within 8 weeks preceding study Atorvastatin baseline LDL-C: 3.65 mmol/L (141 mg/dL) Atorvastatin baseline HDL-C: 1.06 mmol/L (41 mg/dL) Atorvastatin baseline TG: 4.63 mmol/L (410 mg/dL)
Interventions	Atorvastatin 20 mg/d Fluvastatin 80 mg/d
Outcomes	Per cent change from baseline at 3 months of serum LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
------	--------------------	-----------------------

Bevilacqua 2004 (Continued)

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TC data were not reported
Other bias	Unclear risk	The source of funding was not provided

Blagden 2007

Methods	4-Week baseline period 6-Week randomised open-label parallel-group multi-centre study
Participants	148 men and women with untreated primary hypercholesterolaemia and CHD aged 18 to 75 years; LDL-C 3.3 to 5.2 mmol/L (130-209 mg/dL), TG < 4.2 mmol/L (368 mg/dL) 76 participants received atorvastatin, 72 received ezetimibe + atorvastatin Exclusion criteria: congestive heart failure, MI, acute coronary insufficiency, coronary bypass surgery or angioplasty, unstable or severe peripheral artery disease within the past 3 months, unstable angina, poorly controlled type 1 and 2 diabetes, uncontrolled HTN, conditions that affect serum lipids or lipoproteins, renal dysfunction; blood, gastrointestinal or neurological disorders; AST, ALT, CK > 1.5 × ULN; cancer, statin hypersensitivity, individuals taking lipid-lowering treatment, pregnancy Atorvastatin baseline TC: 5.89 mmol/L (228 mg/dL) Atorvastatin baseline LDL-C: 4.09 mmol/L (158 mg/dL) Atorvastatin baseline HDL-C: 1.37 mmol/L (53 mg/dL)
Interventions	Atorvastatin 10 mg/d Ezetimibe 10 mg/d + atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
------	--------------------	-----------------------

Blagden 2007 (Continued)

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	1/76 were not included in the efficacy analysis because of adverse events 1.3% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Schering-Plough funded the study; data may support bias against atorvastatin

Bloomfield 2009

Methods	<p>Visit 1 to Visit 2 period was 6 weeks if the participant needed to wash out from fibrate therapy, or 4 weeks for other lipid-lowering therapy. Participants not requiring a wash-out had 2 weeks between Visit 1 and Visit 2. 2-Week to 6-week placebo run-in between Visits 2 and 3. Participants were randomly assigned at Visit 3</p> <p>8-Week multi-centre randomised double-blind placebo-controlled parallel-group dose-ranging study</p>
Participants	<p>589 men and women aged 18 to 75 years; LDL-C 110 to 190 mg/dL (2.84-4.91 mmol/L), TG > 150 mg/dL (1.69 mmol/L)</p> <p>59 received placebo, 59 received atorvastatin, 236 received anacetrapib, 235 received anacetrapib + atorvastatin</p> <p>Exclusion criteria: CHD history, symptomatic artery disease, uncontrolled cardiac arrhythmias, HTN (> 160/90 mmHg), uncontrolled diabetes, women of childbearing potential or who were pregnant or lactating, use of drugs that affect serum lipids</p> <p>Placebo baseline TC: 5.78 mmol/L (224 mg/dL)</p> <p>Placebo baseline LDL-C: 3.60 mmol/L (139 mg/dL)</p> <p>Placebo baseline HDL-C: 1.33 mmol/L (51 mg/dL)</p> <p>Atorvastatin baseline TC: 5.85 mmol/L (226 mg/dL)</p> <p>Atorvastatin baseline LDL-C: 3.64 mmol/L (141 mg/dL)</p> <p>Atorvastatin baseline HDL-C: 1.31 mmol/L (51 mg/dL)</p>
Interventions	<p>Placebo</p> <p>Atorvastatin 20 mg/d</p> <p>Anacetrapib 10, 40, 150, 300 mg/d</p> <p>Atorvastatin 20 mg/d + anacetrapib 10, 40, 150, 300 mg/d</p>

Bloomfield 2009 (Continued)

Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C and HDL-C
Notes	Placebo and atorvastatin monotherapy groups were analysed WDAEs were reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Low risk	"Randomized via an interactive voice response system equally to one of 10 groups"
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Placebo 1/59 was not included in the efficacy analysis Atorvastatin 20 mg/d 1/59 was not included in the efficacy analysis 1.7% of participants were not included in the efficacy analysis
Selective reporting (reporting bias)	High risk	TG data were not reported because they were expressed as median values
Other bias	High risk	Merck funded the study; data may support bias against atorvastatin

Bo 2001

Methods	2-Month wash-out period 24-Week single-centre randomised open-label study Evening dose
Participants	26 men and women from Italy recruited from a lipid clinic with heterozygous FH, mean age 55 years; TC > 8.0 mmol/L (309 mg/dL), TG < 4.5 mmol/L (399 mg/dL) 13 participants received atorvastatin, 13 received simvastatin Exclusion criteria: aged < 18 and > 75 years, hepatic and renal dysfunction, neurological or endocrine disease, alcohol abuse, neoplasms, use of lipid-lowering drugs, women who are likely to become pregnant Baseline TC, HDL-C and TG values not given Atorvastatin baseline LDL-C: 8.50 mmol/L (329 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 6 weeks Atorvastatin conditional titration of 20 mg/d for 6 to 12 weeks Atorvastatin conditional titration of 40 mg/d for 12 to 18 weeks Atorvastatin conditional titration of 80 mg/d for 18 to 24 weeks Simvastatin 10 mg/d for 0 to 6 weeks

Atorvastatin for lowering lipids (Review)

Bo 2001 (Continued)

Simvastatin conditional titration of 20 mg/d for 6 to 12 weeks

Simvastatin conditional titration of 40 mg/d for 12 to 18 weeks

Simvastatin conditional titration of 80 mg/d for 18 to 24 weeks

Outcomes	Per cent change from baseline at 6 weeks of serum LDL-C
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TC, HDL-C and TG data were not reported
Other bias	Unclear risk	The source of funding was not provided

Bogsrud 2013

Methods	6-Week wash-out period 4-Week before-and-after study
Participants	41 men and women aged 18 to 75 years with hypercholesterolaemia Exclusion criteria: serious adverse events during previous statin therapy, liver or kidney failure, individuals taking concomitant medication that would interfere with the study Atorvastatin baseline TC: 7.17 mmol/L (277 mg/dL) Atorvastatin baseline LDL-C: 5.18 mmol/L (200 mg/dL) Atorvastatin baseline HDL-C: 1.49 mmol/L (57.6 mg/dL) Atorvastatin baseline TG: 1.67 mmol/L (148 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Atorvastatin for lowering lipids (Review)

Bogsrud 2013 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study was funded by Pharma Nord ApS, which does not market statins of any kind

Branchi 1999

Methods	6-Week wash-out period 2-Month randomised study
Participants	200 men and women outpatients from Italy, mean age 58.3 years (24-75); LDL 160 mg/dL (4.14 mmol/L), 160-426 mg/dL (4.14-11.02 mmol/L); TG < 400 mg/dL (4.52 mmol/L), 52 to 398 mg/dL (1.34-4.49 mmol/L) 50 participants received atorvastatin, 50 received fluvastatin, 50 received pravastatin, 50 received simvastatin Exclusion criteria: diabetes, hypothyroidism, renal and hepatic dysfunction Atorvastatin baseline TC: 8.29 mmol/L (320 mg/dL) Atorvastatin baseline LDL-C: 6.05 mmol/L (233 mg/dL) Atorvastatin baseline HDL-C: 1.29 mmol/L (49.88 mg/dL) Atorvastatin baseline TG: 2.09 mmol/L (185 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 2 months Fluvastatin 40 mg/d for 0 to 2 months Pravastatin 20 mg/d for 0 to 2 months Simvastatin 10 mg/d for 0 to 2 months
Outcomes	Per cent change from baseline at 2 months of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Other bias	Unclear risk	The source of funding was not provided

Brown 1998

Methods	12-Week wash-out period 54-Week multi-centre open-label parallel-group randomised study Randomisation code
Participants	318 men and women from the USA aged 18 to 80 years; LDL-C > 130 to 250 mg/dL (3.36-6.5 mmol/L) 80 participants received atorvastatin, 80 received fluvastatin, 81 received lovastatin, 77 received simvastatin Exclusion criteria: pregnancy threat, statin hypersensitivities, taking prohibited medications, secondary hyperlipidaemia, uncontrolled hypothyroidism, nephrotic syndrome, renal dysfunction, uncontrolled diabetes mellitus, hepatic dysfunction, cardiovascular incidents within 1 month of screening, taking confounding agents Atorvastatin baseline TC: 6.57 mmol/L (254 mg/dL) Atorvastatin baseline LDL-C: 4.47 mmol/L (173 mg/dL) Atorvastatin baseline HDL-C: 1.06 mmol/L (41 mg/dL) Atorvastatin baseline TG: 2.29 mmol/L (203 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 12 weeks Atorvastatin 20 mg/d for 12 to 24 weeks Atorvastatin 40 mg/d for 24 to 36 weeks Atorvastatin 80 mg/d for 36 to 48 weeks Atorvastatin 80 mg/d + colestipol 5 g BID for 48 to 54 weeks Simvastatin 10 mg/d for 0 to 12 weeks Simvastatin 20 mg/d for 12 to 24 weeks Simvastatin 40 mg/d for 24 to 36 weeks Simvastatin 40 mg/d + colestipol 5 g BID for 36 to 48 weeks Simvastatin 40 mg/d + colestipol 10 g BID for 48 to 54 weeks Lovastatin 20 mg/d for 0 to 12 weeks Lovastatin 40 mg/d for 12 to 24 weeks Lovastatin 40 mg BID for 24 to 36 weeks Lovastatin 40 mg BID + colestipol 5 g BID for 36 to 48 weeks Lovastatin 40 mg BID + colestipol 10 g BID for 48 to 54 weeks

Brown 1998 (Continued)

Fluvastatin 20 mg/d for 0 to 12 weeks

Fluvastatin 40 mg/d for 12 to 24 weeks

Fluvastatin 40 mg/d + colestipol 5 g BID for 24 to 36 weeks

Fluvastatin 40 mg/d + colestipol 10 g BID for 36 to 54 weeks

Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	12 weeks: 2/80 were not included in the efficacy analysis because of lack of post-randomisation lipid measurement, or participants were off study medication 2.5% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Bruni 2003

Methods	6-Week dietary stabilisation period 6-Week randomised study
Participants	64 men and women with hypercholesterolaemia aged 36 to 63 years 16 participants received atorvastatin, 16 received simvastatin, 16 received fluvastatin, 16 received pravastatin Atorvastatin baseline TC: 6.91 mmol/L (267 mg/dL) Atorvastatin baseline LDL-C: 5.14 mmol/L (199 mg/dL) Atorvastatin baseline HDL-C: 1.24 mmol/L (48 mg/dL) Atorvastatin baseline TG: 1.15 mmol/L (102 mg/dL)
Interventions	Atorvastatin 10 mg/d

Atorvastatin for lowering lipids (Review)

Bruni 2003 (Continued)

Simvastatin 20 mg/d

Fluvastatin 40 mg/d

Pravastatin 40 mg/d

Outcomes	Per cent change from baseline at 3 to 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Bruni 2005

Methods	6-Week wash-out period 6-Week single-centre study
Participants	72 men and women aged 38 to 65 years with hypercholesterolaemia; BMI 24.9, TC 6.58 mmol/L (254 mg/dL), HDL-C 1.23 mmol/L (48 mg/dL), TG 1.11 mmol/L (98 mg/dL) 24 participants received atorvastatin, 24 received simvastatin, 24 received pravastatin Exclusion criteria: history of cardiovascular events, HTN, diabetes mellitus; liver, renal, thyroid infection; immunological or malignant disease, pregnancy threat Atorvastatin baseline TC: 6.56 mmol/L (254 mg/dL) Atorvastatin baseline LDL-C: 4.84 mmol/L (187 mg/dL) Atorvastatin baseline HDL-C: 1.21 mmol/L (47 mg/dL) Atorvastatin baseline TG: 1.11 mmol/L (98.4 mg/dL)
Interventions	Atorvastatin 10 mg/d Simvastatin 20 mg/d Pravastatin 40 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias
Atorvastatin for lowering lipids (Review)

Bruni 2005 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, this is an unblinded trial
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Budinski 2009

Methods	6-Week to 8-week lead-in dietary stabilisation period 12-Week multi-centre prospective randomised double-blind double-dummy controlled trial
Participants	821 men and non-pregnant, non-lactating women aged 18 to 75 years with primary hypercholesterolaemia or combined dyslipidaemia; LDL-C 160 to 220 mg/dL (4.1-5.7 mmol/L), TG \leq 400 mg/dL (4.5 mmol/L) 616 participants received pitavastatin; 102 received atorvastatin 10 mg for 0 to 12 weeks; 103 received atorvastatin 10 mg for 4 weeks, then titrated up to atorvastatin 20 mg for 4 to 12 weeks Exclusion criteria: statin intolerance, homozygous FH, familial hypoalphalipoproteinaemia, secondary dyslipidaemia, uncontrolled diabetes mellitus, pregnancy, condition affecting drug metabolism or excretion, heart failure type III or IV, significant CVD, impaired pancreatic function, liver enzyme levels $> 1.5 \times$ ULN, impaired renal function, impaired urinary tract function, uncontrolled hypothyroidism, symptomatic cerebrovascular disease, left ventricular ejection fraction < 0.25 , uncontrolled HTN, muscular or neuromuscular disease, cancer, treatment with other lipid-lowering drugs or drug that interfere with statins Atorvastatin baseline TC: 6.76 mmol/L (261 mg/dL) Atorvastatin baseline LDL-C: 4.65 mmol/L (180 mg/dL) Atorvastatin baseline HDL-C: 1.30 mmol/L (50 mg/dL) Atorvastatin baseline TG: 1.77 mmol/L (157 mg/dL)
Interventions	Atorvastatin 10 mg/d Atorvastatin 10 mg/d for 4 weeks, then titrated to 20 mg/d for Weeks 4 to 12 Pitavastatin 2 mg/d Pitavastatin 2 mg/d for 4 weeks, then titrated to 4 mg/d for Weeks 4 to 12

Budinski 2009 (Continued)

Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin monotherapy group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, this is an unblinded trial
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Buldak 2012

Methods	<p>Wash-out period was not required because individuals receiving lipid-lowering agents were excluded from the study</p> <p>3-Month single-blind randomised trial</p>
Participants	<p>67 men and women with mixed hyperlipidaemia aged 35 to 65 years</p> <p>TC > 200 mg/dL (5.17 mmol/L), LDL-C > 130 mg/dL (3.36 mmol/L), TG > 200 mg/dL (2.26 mmol/L), fasting glycaemia (100-125 mg/dL), glycaemia at 2 hours of oral glucose tolerance test < 140 mg/dL, BMI 25 to 35 kg/m², postmenopausal state or effective methods of mechanical contraception</p> <p>Exclusion criteria: secondary hyperlipidaemia, significant heart failure, unstable coronary artery disease, moderate or severe hypertension, cancer within 5 years, chronic kidney disease (Stage III-V), hepatic dysfunction, malnutrition syndrome, diabetes or glucose intolerance, oral contraceptive or HRT, inflammatory disease, non-compliance, abnormal safety lab findings</p> <p>Atorvastatin baseline TC: 6.67 mmol/L (258 mg/dL) Atorvastatin baseline LDL-C: 3.93 mmol/L (152 mg/dL) Atorvastatin baseline HDL-C: 1.13 mmol/L (43.7 mg/dL) Atorvastatin baseline TG: 2.71 mmol/L (240 mg/dL)</p>
Interventions	<p>Atorvastatin 10 mg/d</p> <p>Fenofibrate 267 mg/d</p> <p>Atorvastatin fenofibrate 10/267 mg/d combination therapy</p>

Atorvastatin for lowering lipids (Review)

Buldak 2012 (Continued)

Outcomes	Per cent change from baseline at 30 to 90 days of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin monotherapy group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, this is an unblinded trial
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	University-funded trial

CAP 2008

Methods	6-Week wash-out period 26-Week multi-centre prospective randomised double-blind double-dummy design
Participants	340 men and women aged < 80 years with documented CAD; low-grade inflammation, LDL-C 1.29 to 3.87 mmol/L (50-150 mg/dL), TG ≤ 4.56 mmol/L (400 mg/dL) 170 received 10 mg/d, 169 received 80 mg/d Exclusion criteria: presence of secondary hyperlipidaemia or type 1 diabetes mellitus or type 2 with insulin therapy, inadequately controlled diabetes mellitus, alcohol or drug abuse, inadequate compliance, progressive or life-threatening disease with life expectancy < 1 year, statin intolerance, active hepatic disease or hepatic dysfunction, use of a potent cytochrome P450 3A4 inhibitor, women who were pregnant or breastfeeding Atorvastatin 10 mg/d baseline TC: 5.41 mmol/L (209 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 3.26 mmol/L (126 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.24 mmol/L (48 mg/dL) Atorvastatin 10 mg/d baseline TG: 2.05 mmol/L (182 mg/dL) Atorvastatin 80 mg/d baseline TC: 5.34 mmol/L (206 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 3.26 mmol/L (126 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.24 mmol/L (48 mg/dL) Atorvastatin 80 mg/d baseline TG: 1.85 mmol/L (164 mg/dL)

CAP 2008 (Continued)

Interventions	Atorvastatin 10 mg/d Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 5 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin 10 mg/d: All 170 were included in the analysis Atorvastatin 80 mg/d: 1/170 was not included in the ITT analysis because of lack of post-baseline data 0.3% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin

Castano 2003a

Methods	4-Week wash-out period 8-Week single-centre randomised single-blind parallel-treatment period Randomly assigned by a fixed randomisation method using a block size of 10 and an allocation ratio of 1:1 Evening dose
Participants	75 men and women from Cuba with type II hypercholesterolaemia, mean age 65 years (60 to 80); Veterans House, LDL-C \geq 3.4 mmol/L (131 mg/dL), TC \geq 5.2 mmol/L (201 mg/dL), TG < 4.52 mmol/L (400 mg/dL) 37 participants received atorvastatin, 38 received policosanol Exclusion criteria: renal and hepatic dysfunction, severe HTN, neoplastic disease and uncontrolled diabetes, unstable cardiovascular condition Atorvastatin baseline TC: 6.34 mmol/L (245 mg/dL) Atorvastatin baseline LDL-C: 4.27 mmol/L (165 mg/dL) Atorvastatin baseline HDL-C: 1.27 mmol/L (49.11 mg/dL) Atorvastatin baseline TG: 2.04 mmol/L (181 mg/dL)
Interventions	Atorvastatin 10 mg/d

Atorvastatin for lowering lipids (Review)

Castano 2003a (Continued)

Policosanol 10 mg/d

Outcomes	Per cent change from baseline at 4 to 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Chen 2013

Methods	4-Week placebo run-in wash-out period 12-Week randomized double-blind trial
Participants	Men and women aged 18 to 80 years with mixed hyperlipidaemia; LDL-C 130 to 190 mg/dL (3.36-4.91 mmol/L), TG 150 to 500 mg/dL (1.69-5.65 mmol/L) Exclusion criteria: creatinine > 2.0 mg/dL, ALT or AST > 1.5 ULN, creatine kinase > 2 ULN, abnormal thyroid-stimulating hormone, endocrine or metabolic disease, significant renal disease, cardiovascular event or procedure within 3 months, hepatic disease, peptic ulcer disease within 3 months of study, gout within 1 year unless taking allopurinol, cancer within 5 years, gastric bypass surgery and HIV, pregnancy or breastfeeding women, those about to get pregnant, medications or supplements that affect lipid metabolism and HRT
Interventions	ERN/LRPT 1 g + simvastatin 10 mg, then titrated to ERN/LRPT 2 g + simvastatin 20 mg at 4 weeks ERN/LRPT 1 g + simvastatin 20 mg, then titrated to ERN/LRPT 2 g + simvastatin 40 mg at 4 weeks Atorvastatin 10 mg Atorvastatin 20 mg Atorvastatin 40 mg Atorvastatin 80 mg
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C and HDL-C
Notes	Atorvastatin monotherapy groups were analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin treatment arms were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin treatment arms were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin treatment arms were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	18/298 (6.0%) of atorvastatin 10-mg/d arm were not included in the efficacy analysis 37/439 (8.4%) of atorvastatin 20-mg/d arm were not included in the efficacy analysis

Atorvastatin for lowering lipids (Review)

Chen 2013 (Continued)

27/437 (6.2%) of atorvastatin 40-mg/d arm were not included in the efficacy analysis

31/433 (7.2%) of atorvastatin 80-mg/d arm were not included in the efficacy analysis

Selective reporting (reporting bias)	High risk	Serum triglycerides were not measured
Other bias	High risk	Merck funded the trial

CHES 2003

Methods	6-Week run-in period 24-Week multi-centre randomised double-blind parallel-group study
Participants	917 men and women from the USA with hypercholesterolaemia aged 21 to 75 years; LDL-C > 130 mg/dL (3.36 mmol/L), HDL-C < 40 mg/dL (1.03 mmol/L) in men; HDL-C < 50 mg/dL (1.29 mmol/L) in women; TG > 150 mg/dL (1.69 mmol/L) 464 participants received atorvastatin, 453 received simvastatin Exclusion criteria: drugs known to interfere with statin metabolism, renal dysfunction, secondary hypercholesterolaemia, diabetes mellitus, hepatic dysfunction, CK 50% > ULN Atorvastatin baseline LDL-C: 4.85 mmol/L (187.5 mg/dL) Atorvastatin baseline HDL-C: 1.21 mmol/L (47 mg/dL)
Interventions	Atorvastatin 80 mg/d Simvastatin 80 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum LDL-C and HDL-C
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	Atorvastatin group: 95/464 were missing (without valid baseline and post-baseline measurements and withdrawal due to adverse events) 20.4% of participants were excluded from the efficacy analysis

CHES 2003 (Continued)

Selective reporting (reporting bias)	High risk	TC and TG data were not reported
Other bias	High risk	Merck funded the study; data may support bias against atorvastatin

CHEST 2003

Methods	No use of lipid-lowering agents in the 6 months before enrolment 12-Week before-and-after study	
Participants	80 men and women from the USA aged > 18 years 2 participants failed to return for follow-up blood testing; therefore 78 participants were included in the analysis 30 participants received atorvastatin, 21 received simvastatin, 27 received pravastatin Exclusion criteria: CHD history, hepatic dysfunction, statin intolerance history, alcohol or drug abuse, major illness, surgery, malignancy, pregnancy threat Atorvastatin baseline TC: 6.15 mmol/L (238 mg/dL) Atorvastatin baseline LDL-C: 4.08 mmol/L (158 mg/dL) Atorvastatin baseline HDL-C: 1.22 mmol/L (47 mg/dL) Atorvastatin baseline TG: 2.05 mmol/L (182 mg/dL)	
Interventions	Atorvastatin 10 mg/d Simvastatin 20 mg/d Pravastatin 40 mg/d	
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	Atorvastatin group was analysed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured

CHEST 2003 (Continued)

Other bias	Low risk	The study appears to be free of other sources of bias
------------	----------	---

CHIBA 2008

Methods	4-Week dietary lead-in period 12-Week open randomised study
Participants	204 men and women aged ≥ 20 years; TC ≥ 220 mg/dL, TG < 400 mg/dL including FH 103 participants received atorvastatin, 101 received pitavastatin Exclusion criteria: statin hypersensitivity, hepatic dysfunction, ALT ≥ 100 IU/L, suspected hepatic metabolism disorders or biliary obstruction, renal dysfunction, pregnancy or those who may become pregnant, poorly controlled diabetes Atorvastatin baseline TC: 6.90 mmol/L (267 mg/dL) Atorvastatin baseline LDL-C: 4.60 mmol/L (178 mg/dL) Atorvastatin baseline HDL-C: 1.55 mmol/L (60 mg/dL) Atorvastatin baseline TG: 1.61 mmol/L (143 mg/dL)
Interventions	Atorvastatin 10 mg/d Pitavastatin 2 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	5/103 were excluded from the efficacy analysis because of loss to follow-up 103 were included in the safety analysis 5% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Cho 2011

Methods	4-Week wash-out dietary stabilisation period 6-Week before-and-after study
Participants	43 men and women with CAD and hypercholesterolaemia aged 20 to 79 years; TG \geq 200 mg/dL but < 400 mg/dL, HDL-C < 40 mg/dL Exclusion criteria: congestive heart failure type III or IV, poorly controlled HTN, uncontrolled endocrine or metabolic disease known to influence serum lipid profile and concomitant excluded drug use Baseline TC: 5.13 mmol/L (198 mg/dL) Baseline LDL-C: 3.42 mmol/L (132 mg/dL) Baseline HDL-C: 1.19 mmol/L (46 mg/dL) Baseline TG: 1.47 mmol/L (130 mg/dL)
Interventions	Atorvastatin 20 mg/d Ezetimibe/simvastatin 10/20 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not stated

Chu 2006a

Methods	4-Week wash-out period 3 months of rosiglitazone monotherapy, then 3 more months of atorvastatin 10 mg/d added
---------	---

Atorvastatin for lowering lipids (Review)

Chu 2006a (Continued)

Participants	<p>30 men and women with type 2 diabetes and hypercholesterolaemia; TC \geq 200 mg/dL, LDL-C \geq 160 mg/dL</p> <p>Exclusion criteria: renal or hepatic disease, jaundice, severe hypertriglyceridaemia, anaemia, acute illness, leukocytosis, thrombocytosis, chronic inflammatory disease, connective tissue disorder, Class III or IV congestive heart failure, ACS within 6 months of screening, SBP > 180 mmHg, DBP > 110 mmHg, drug or alcohol abuse, use of cytochrome P450 3A inducers or inhibitors</p> <p>Baseline TC: 5.90 mmol/L (228 mg/dL) Baseline LDL-C: 3.49 mmol/L (135 mg/dL) Baseline HDL-C: 1.09 mmol/L (42 mg/dL) Baseline TG: 2.31 mmol/L (205 mg/dL)</p>
Interventions	Atorvastatin 10 mg/d + rosiglitazone 4 mg/d
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d + rosiglitazone 4 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d + rosiglitazone 4 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d + rosiglitazone 4 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Chu 2006b

Methods	<p>4-Week dietary stabilisation period</p> <p>3-Month before-and-after study</p>
Participants	<p>26 consecutive men and women outpatients with hypercholesterolaemia; TC > 200 mg/dL, LDL-C > 160 mg/dL</p> <p>Exclusion criteria: active hepatic or renal disease, any acute illness, leukocytosis, thrombocytosis, chronic inflammatory disease, cancer, connective tissue disease, corticosteroid therapy, ACS within 6 months of enrolment, women of childbearing potential, pregnant women</p>

Chu 2006b (Continued)

Baseline TC: 6.72 mmol/L (260 mg/dL)
 Baseline LDL-C: 4.89 mmol/L (189 mg/dL)
 Baseline HDL-C: 1.09 mmol/L (42 mg/dL)
 Baseline TG: 1.45 mmol/L (128 mg/dL)

Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Chu 2006c

Methods	4-Week dietary stabilisation period 3-Month before-and-after study
Participants	32 men and women with hypercholesterolaemia; TC > 200 mg/dL (5.17 mmol/L), LDL-C > 130 mg/dL (3.36 mmol/L) Exclusion criteria: any acute illness, leukocytosis, thrombocytosis, chronic inflammatory disease, connective tissue disease, individuals with ACS within 6 months of enrolment Baseline TC: 6.60 mmol/L (255 mg/dL) Baseline LDL-C: 4.61 mmol/L (178 mg/dL) Baseline HDL-C: 1.09 mmol/L (42 mg/dL) Baseline TG: 1.76 mmol/L (156 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG

Atorvastatin for lowering lipids (Review)

Chu 2006c (Continued)

Notes SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Claeys 2004

Methods	4-Week placebo run-in period 4-Week before-and-after multi-centre study
Participants	41 individuals with stable ischaemic heart disease; LDL-C > 130 mg/dL (3.36 mmol/L) Exclusion criteria: ACS within 1 month of study entry, with PTCA/CABG within 3 months of study entry; severe organic disease, baseline ECG abnormalities, treatment with lipid-lowering therapy within 2 months of study, treatment with medications interfering with statin metabolism Baseline TC: 6.52 mmol/L (252 mg/dL) Baseline LDL-C: 4.19 mmol/L (162 mg/dL) Baseline HDL-C: 1.58mmol/L (61 mg/dL) Baseline TG: 1.69 mmol/L (150 mg/dL)
Interventions	Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Claeys 2004 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin

COMETS 2005

Methods	4-Week wash-out period 12-Week multi-centre randomised double-blind placebo-controlled double-dummy parallel-group study
Participants	<p>401 men and women recruited internationally with metabolic syndrome aged > 17 years; TG > 1.70 mmol/L (150 mg/dL), HDL-C < 1.04 mmol/L (40 mg/dL) for men, HDL-C < 1.30 mmol/L (50 mg/dL) for women, LDL-C > 3.36 mmol/L (130 mg/dL)</p> <p>79 participants received placebo, 157 received atorvastatin, 165 received rosuvastatin</p> <p>Exclusion criteria: use of lipid-lowering agents within past 6 months, CVD, FH, statin hypersensitivity, uncontrolled hypothyroidism and HTN, acute liver disease and hepatic dysfunction, unexplained serum CK increase, use of prohibited concomitant medications</p> <p>Placebo baseline TC: 6.60 mmol/L (255 mg/dL) Placebo baseline LDL-C: 4.42 mmol/L (171 mg/dL) Placebo baseline HDL-C: 1.20 mmol/L (46 mg/dL) Placebo baseline TG: 5.40 mmol/L (478 mg/dL)</p> <p>Atorvastatin baseline TC: 6.47 mmol/L (250 mg/dL) Atorvastatin baseline LDL-C: 4.35 mmol/L (168 mg/dL) Atorvastatin baseline HDL-C: 1.16 mmol/L (45 mg/dL) Atorvastatin baseline TG: 5.30 mmol/L (470 mg/dL)</p>
Interventions	Placebo 0 to 6 weeks Placebo 6 to 12 weeks Atorvastatin 10 mg/d for 0 to 6 weeks Atorvastatin 20 mg/d for 6 to 12 weeks Rosuvastatin 10 mg/d for 0 to 6 weeks Rosuvastatin 20 mg/d for 6 to 12 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	0-Week to 6-week placebo and atorvastatin groups were analysed WDAEs were reported

Risk of bias
Atorvastatin for lowering lipids (Review)

COMETS 2005 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"A double-blind, double-dummy"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Placebo: 1/79 were not included in the efficacy analysis Atorvastatin 10 mg/d: 2/157 were not included in the efficacy analysis 1.3% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study. Data may support bias against atorvastatin Conflict of Interest: Some study authors had received consultant fees from several pharmaceutical companies

CORALL 2005

Methods	6-Week wash-out period 18-Week multi-centre open randomised study
Participants	263 men and women from the Netherlands with NIDDM aged > 18 years; LDL-C 2.99 to 5.00 mmol/L (115.6-193.3 mg/dL), TG < 4.52 mmol/L (400.7 mg/dL) 132 participants received atorvastatin, 131 received rosuvastatin Exclusion criteria: statin hypersensitivity, active CVD, pregnancy threat, renal and hepatic disease, homozygous FH, uncontrolled hypothyroidism, unexplained CK elevations > 3 × ULN Atorvastatin baseline TC: 6.53 mmol/L (252.5 mg/dL) Atorvastatin baseline LDL-C: 4.43 mmol/L (171 mg/dL) Atorvastatin baseline HDL-C: 1.27 mmol/L (49 mg/dL) Atorvastatin baseline TG: 1.84 mmol/L (163 mg/dL)
Interventions	Atorvastatin 20 mg/d Atorvastatin conditional titrated dose of 40 mg/d for 6 to 12 weeks Atorvastatin conditional titrated dose of 80 mg/d for 12 to 18 weeks Rosuvastatin 10 mg/d Rosuvastatin conditional titrated dose of 20 mg/d for 6 to 12 weeks Rosuvastatin conditional titrated dose of 40 mg/d for 12 to 18 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Atorvastatin for lowering lipids (Review)

CORALL 2005 (Continued)

SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group as included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may be biased against atorvastatin

Crouse III 1999

Methods	4-Week wash-out period 12-Week open randomised multi-centre treatment period
Participants	842 individuals with hypercholesterolaemia 425 participants received atorvastatin, 417 received simvastatin Exclusion criteria: none reported No baseline TC value given Atorvastatin baseline LDL-C: 5.5 mmol/L (213 mg/dL) Atorvastatin baseline HDL-C: 1.2 mmol/L (46.4 mg/dL) Atorvastatin baseline TG: 2.1 mmol/L (186 mg/dL)
Interventions	Atorvastatin 20 mg/d Atorvastatin 40 mg/d Simvastatin 40 mg/d Simvastatin 80 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum LDL-C, HDL-C and TG
Notes	Atorvastatin groups were analysed

Risk of bias
Atorvastatin for lowering lipids (Review)

Crouse III 1999 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d and atorvastatin 40 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d and atorvastatin 40 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d and atorvastatin 40 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TC data were not reported
Other bias	High risk	Merck and Co funded the study; data may support bias against atorvastatin

Cubeddu 2006

Methods	8-Week wash-out period 12-Week double-blind randomised placebo-controlled double-dummy parallel study Randomly assigned by a double-dummy design to 4 groups
Participants	99 men and women from the USA aged > 20 years; LDL-C 140 to 190 mg/dL (3.62-4.91 mg/dL) 25 participants received policosanol, 25 received atorvastatin, 25 received policosanol plus atorvastatin, 24 received placebo Exclusion criteria: individuals with CVD, hepatic dysfunction, renal dysfunction, uncontrolled diabetes mellitus, alcohol or drug abuse, oral hypoglycaemic therapy within 4 weeks of study, cancer, hyperthyroidism, women who might become pregnant, HRT Placebo baseline TC: 6.23 mmol/L (241 mg/dL) Placebo baseline LDL-C: 4.08 mmol/L (158 mg/dL) Placebo baseline HDL-C: 1.31 mmol/L (51 mg/dL) Placebo baseline TG: 1.80 mmol/L (159 mg/dL) Atorvastatin baseline TC: 6.54 mmol/L (253 mg/dL) Atorvastatin baseline LDL-C: 4.34 mmol/L (168 mg/dL) Atorvastatin baseline HDL-C: 1.38 mmol/L (53 mg/dL) Atorvastatin baseline TG: 1.82 mmol/L (161 mg/dL)
Interventions	Placebo Atorvastatin 10 mg/d Policosanol 20 mg/d Policosanol 20 mg/d + atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Placebo and atorvastatin monotherapy group was analysed

Atorvastatin for lowering lipids (Review)

Cubeddu 2006 (Continued)

SDs were imputed
 WDAEs were reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	"A noninvestigator pharmacist provided to the study coordinator the medications according to the randomization code"
Blinding (performance bias and detection bias) All outcomes	Low risk	"Atorvastatin and dummy atorvastatin were provided in identical bottles" "A randomized, parallel, double-blind"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	PHARMED Group funded the study; PHARMED Group markets policosanol; data may support bias against atorvastatin

CURVES 1998

Methods	6-Week wash-out period 8-Week multi-centre randomised open-label parallel-group study
Participants	<p>534 men and women from the USA with hypercholesterolaemia, 55 years old (20-80); LDL > 161 mg/dL (4.16 mmol/L), TG < 401 mg/dL (4.53 mmol/L)</p> <p>ITT analysis included 522 participants who provided post-treatment efficacy data</p> <p>195 participants received atorvastatin, 80 received pravastatin, 180 received simvastatin, 43 received lovastatin, 24 received fluvastatin</p> <p>Exclusion criteria: primary hypothyroidism, nephrotic syndrome, uncontrolled diabetes, HTN hepatic dysfunction, BMI > 32, MI, coronary bypass, unstable angina, HMG-CoA reductase inhibitor hypersensitivities, participants receiving lipid-altering drugs</p> <p>Atorvastatin 10 mg/d baseline TC: 7.72 mmol/L (299 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 5.52 mmol/L (213 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.37 mmol/L (53 mg/dL) Atorvastatin 10 mg/d baseline TG: 1.91 mmol/L (169 mg/dL)</p> <p>Atorvastatin 20 mg/d baseline TC: 7.68 mmol/L (297 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 5.51 mmol/L (213 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.28 mmol/L (49 mg/dL) Atorvastatin 20 mg/d baseline TG: 1.94 mmol/L (172 mg/dL)</p> <p>Atorvastatin 40 mg/d baseline TC: 7.40 mmol/L (286 mg/dL) Atorvastatin 40 mg/d baseline LDL-C: 5.32 mmol/L (206 mg/dL) Atorvastatin 40 mg/d baseline HDL-C: 1.29 mmol/L (50 mg/dL) Atorvastatin 40 mg/d baseline TG: 1.73 mmol/L (153 mg/dL)</p>

Atorvastatin for lowering lipids (Review)

CURVES 1998 (Continued)

Atorvastatin 80 mg/d baseline TC: 7.65 mmol/L (296 mg/dL)
 Atorvastatin 80 mg/d baseline LDL-C: 5.51 mmol/L (213 mg/dL)
 Atorvastatin 80 mg/d baseline HDL-C: 1.37 mmol/L (53 mg/dL)
 Atorvastatin 80 mg/d baseline TG: 1.69 mmol/L (150 mg/dL)

Interventions	Atorvastatin 10 mg/d Atorvastatin 20 mg/d Atorvastatin 40 mg/d Atorvastatin 80 mg/d Simvastatin 10 mg/d Simvastatin 20 mg/d Simvastatin 40 mg/d Pravastatin 10 mg/d Pravastatin 20 mg/d Pravastatin 40 mg/d Lovastatin 20 mg/d Lovastatin 40 mg/d Lovastatin 80 mg/d Fluvastatin 20 mg/d Fluvastatin 40 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin groups were analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured

Atorvastatin for lowering lipids (Review)

CURVES 1998 (Continued)

Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin
------------	-----------	--

DALI 2001

Methods	<p>Lipid-lowering drugs were withdrawn at least 8 weeks before the start of the 2-week placebo run-in phase</p> <p>30-Week double-blind randomised placebo-controlled trial</p>
Participants	<p>217 men and women with diabetic dyslipidaemia aged 45 to 75 years; TC 4.0 to 8.0 mmol/L (155-309 mg/dL)</p> <p>TG 1.5 to 6.0 mmol/L (133-531 mg/dL)</p> <p>72 participants received placebo</p> <p>73 participants received atorvastatin 10 mg/d</p> <p>72 participants received atorvastatin 40 mg/d</p> <p>Exclusion criteria: MI history, coronary angioplasty, bypass, coronary artery disease</p> <p>Unstable with severe angina pectoris, heart failure, severe cardiac arrhythmia, renal or hepatic dysfunction, intestinal bypass surgery, any surgical procedure or systemic inflammatory disease within 3 months of trial, cancer, vasculitis, rheumatoid arthritis, lung fibrosis, ulcerative colitis, Crohn's disease, drug known to interfere with lipid metabolism</p> <p>Placebo baseline TG: 2.62 mmol/L (232 mg/dL)</p> <p>Atorvastatin 10 mg/d baseline TG: 2.54 mmol/L (225 mg/dL)</p> <p>Atorvastatin 40 mg/d baseline TG: 2.85 mmol/L (252 mg/dL)</p>
Interventions	<p>Placebo for 0 to 4 weeks</p> <p>Atorvastatin 10 mg/d for 0 to 4 weeks</p> <p>Atorvastatin 40 mg/d for 0 to 4 weeks</p> <p>Atorvastatin 80 mg/d for 4 to 30 weeks</p>
Outcomes	Per cent change from baseline in serum triglycerides
Notes	<p>Atorvastatin 80 mg/d for 4 to 30 weeks; intervention was not analysed</p> <p>SDs were imputed</p>

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'

DALI 2001 (Continued)

Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	High risk	Triglycerides were included in the efficacy analysis
Other bias	High risk	Parke-Davis funded the study; efficacy data could be biased towards atorvastatin

Davidson 2002

Methods	6-Week wash-out period 12-Week multi-centre double-blind randomised Placebo-controlled treatment period	
Participants	519 men and women from Canada and the USA aged ≥ 18 years with type IIa or IIb hypercholesterolaemia; LDL 4.14 to 6.47 mmol/L (160-250 mg/dL), TG ≤ 4.52 mmol/L (175 mg/dL) 132 participants received placebo, 259 received rosuvastatin, 128 received atorvastatin Exclusion criteria: unstable CVD, FH, uncontrolled HTN and diabetes, hepatic dysfunction Placebo baseline TC: 7.06 mmol/L (273 mg/dL) Placebo baseline LDL-C: 4.83 mmol/L (187 mg/dL) Placebo baseline HDL-C: 1.26 mmol/L (49 mg/dL) Placebo baseline TG: 2.11 mmol/L (187 mg/dL) Atorvastatin baseline TC: 7.04 mmol/L (272 mg/dL) Atorvastatin baseline LDL-C: 4.80 mmol/L (186 mg/dL) Atorvastatin baseline HDL-C: 1.30 mmol/L (50 mg/dL) Atorvastatin baseline TG: 2.06 mmol/L (182 mg/dL)	
Interventions	Placebo for 0 to 12 weeks Atorvastatin 10 mg/d for 0 to 12 weeks Rosuvastatin 10 mg/d for 0 to 12 weeks Rosuvastatin 20 mg/d for 0 to 12 weeks	
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	Placebo and atorvastatin monotherapy group was analysed WDAEs were reported	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'

Davidson 2002 (Continued)

Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind study, placebo-controlled trial"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin group at 12 weeks: 1/128 was not included in the efficacy analysis because participant did not take any medication. All 132 participants receiving placebo were included in the efficacy analysis 0.4% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Della-Morte 2011

Methods	No wash-out period was required because no participant received lipid medications within 6 months of the trial 1 month before and after study
Participants	40 men and women stroke free and statin naive with coronary heart disease or equivalent ≥ 2 risk factors for CHD and an LDL ≥ 130 mg/dL (3.36 mmol/L) < 2 risk factors and an LDL ≥ 160 mg/dL (4.14 mmol/L) Men ≥ 45 years, women ≥ 55 years; NCEP ATP III risk factors for CHD Exclusion criteria: carotid stenosis ≥ 60%, hospitalisation for acute coronary syndrome within the past 6 months, hepatic or renal dysfunction, connective tissue or chronic inflammatory disease, cancer history, any acute illness, leukocytosis, thrombocytosis, anaemia, corticosteroid use, pregnancy or breast-feeding Atorvastatin baseline TC: 5.715 mmol/L (221 mg/dL) Atorvastatin baseline LDL-C: 3.72 mmol/L (144 mg/dL) Atorvastatin baseline HDL-C: 1.267 mmol/L (49 mg/dL) Atorvastatin baseline TG: 1.51 mmol/L (134 mg/dL)
Interventions	Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 30 days of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; treatment intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Della-Morte 2011 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 80 mg/d; treatment intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 80 mg/d; treatment intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer funded the study

Demir 2001

Methods	No wash-out was required because participants were not treated pharmacologically or participants receiving other hypolipidaemic drugs were excluded from the study 12-Week prospective open-label non-comparative study	
Participants	19 men and women with hypercholesterolaemia from Turkey aged ≥ 30 years; LDL-C ≥ 130 mg/dL or TC ≥ 200 mg/dL or both Exclusion criteria: history of acute coronary events or clinical instability, severe congestive heart failure, TG > 600 mg/dL, uncontrolled HTN, statin hypersensitivity, active liver disease or hepatic dysfunction, secondary hypercholesterolaemia, CK $> 3 \times$ ULN, alcoholism, any medication that could possibly interfere with haemostatic parameters Baseline TC: 6.71 mmol/L (259 mg/dL) Baseline LDL-C: 4.59 mmol/L (177 mg/dL) Baseline HDL-C: 1.29 mmol/L (50 mg/dL) Baseline TG: 1.78 mmol/L (158 mg/dL)	
Interventions	Atorvastatin 10 mg/d	
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Atorvastatin for lowering lipids (Review)

Demir 2001 (Continued)

All outcomes

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Despres 2002

Methods	4-Week wash-out period 12-Week multi-centre randomised open-label study
Participants	181 men and women from Canada and the UK with dyslipidaemia, mean age 50 years (18-75); HDL-C < 1.1 to 1.2 mmol/L (42.5-46.4 mg/dL), LDL-C > 125 mg/dL (3.23 mmol/L), TG < 400 mg/dL (4.52 mmol/L) 87 participants received fenofibrate, 94 received atorvastatin Exclusion criteria: type 1 and 2 diabetes, pancreatitis, gall bladder disease, ulcers, alcohol abuse Atorvastatin baseline TC: 6.15 mmol/L (238 mg/dL) Atorvastatin baseline LDL-C: 4.18 mmol/L (162 mg/dL) Atorvastatin baseline HDL-C: 0.94 mmol/L (36.35 mg/dL) Atorvastatin baseline TG: 2.26 mmol/L (200 mg/dL)
Interventions	Atorvastatin 10 mg/d Fenofibrate 200 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin group: 8/94 were not included in the efficacy analysis according to the ITT principle, using the population of the full analysis set, that is, all treated participants with a baseline value and at least 1 value on treatment 8.5% of participants were excluded from the efficacy analysis

Despres 2002 (Continued)

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Diepeveen 2005

Methods	<p>Wash-out was not required because no participants used lipid-lowering drugs</p> <p>12-Week double-blind placebo-controlled trial</p>
Participants	<p>44 clinically stable non-diabetic men and women from the Netherlands receiving dialysis therapy without manifest CVD, mean age 49 years; BMI 24.7</p> <p>Exclusion criteria: none</p> <p>Groups 1 and 4</p> <p><u>Placebo:</u></p> <p>Baseline TC: 4.8 mmol/L (186 mg/dL) Baseline LDL-C: 2.7 mmol/L (104 mg/dL) Baseline HDL-C: 0.92 mmol/L (35.6 mg/dL) Baseline TG: 2.6 mmol/L (230 mg/dL)</p> <p><u>Atorvastatin:</u></p> <p>Baseline TC: 5.1 mmol/L (197 mg/dL) Baseline LDL-C: 2.6 mmol/L (100.5 mg/dL) Baseline HDL-C: 0.97 mmol/L (37.5 mg/dL) Baseline TG: 3.8 mmol/L (337 mg/dL)</p> <p>Groups 2 and 3</p> <p><u>Placebo:</u></p> <p>Baseline TC: 4.8 mmol/L (186 mg/dL) Baseline LDL-C: 2.7 mmol/L (104 mg/dL) Baseline HDL-C: 0.95 mmol/L (36.7 mg/dL) Baseline TG: 2.5 mmol/L (221 mg/dL)</p> <p><u>Atorvastatin:</u></p> <p>Baseline TC: 4.9 mmol/L (189 mg/dL) Baseline LDL-C: 3.0 mmol/L (116 mg/dL) Baseline HDL-C: 1.46 mmol/L (56.5 mg/dL) Baseline TG: 1.7 mmol/L (151 mg/dL)</p>
Interventions	<p>Group 1: atorvastatin 40 mg/d + placebo vitamin E</p> <p>Group 2: placebo atorvastatin + vitamin E</p> <p>Group 3: atorvastatin 40 mg/d + vitamin E</p> <p>Group 4: placebo atorvastatin + placebo vitamin E</p>
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin data from groups 1 and 3 were combined, and placebo data from groups 2 and 4 were combined

Diepeveen 2005 (Continued)

No WDAEs were reported
 SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	Unclear risk	The source of funding was not reported

DISCOVERY 2005

Methods	6-Week dietary stabilisation period 12-Week randomised multi-national multi-centre open-label 2-arm parallel-group phase 3b/4 study
Participants	2159 men and women were enrolled in the study, of whom 1482 aged ≥ 18 years with primary hypercholesterolaemia were randomly assigned with LDL-C > 3.5 mmol/L (135 mg/dL), cardiovascular risk $> 20\%/10$ y, type 2 diabetes, history of CHD or other established atherosclerotic disease Exclusion criteria: none 995 participants received rosuvastatin (950 in the ITT efficacy analysis set), 487 received atorvastatin (472 in the ITT efficacy analysis set) Atorvastatin baseline TC: 6.50 mmol/L (251 mg/dL) Atorvastatin baseline LDL: 4.38 mmol/L (169 mg/dL) Atorvastatin baseline HDL: 1.33 mmol/L (51 mg/dL) Atorvastatin baseline TG: 1.74 mmol/L (154 mg/dL)
Interventions	Atorvastatin 10 mg/d Rosuvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias
Atorvastatin for lowering lipids (Review)

DISCOVERY 2005 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	205/472 were not analysed because no dietary wash-out baseline stabilisation period was provided for the 204 switched participants and 1 participant had Week 12 lipid data provided by a non-study laboratory
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

DISCOVERY ALPHA 2006

Methods	No lipid-lowering therapies within the previous 6 months if lipid-lowering therapy-naive; 12-week randomised open-label study
Participants	<p>1506 men and women aged ≥ 18 years with primary hypercholesterolaemia; LDL-C > 3.5 mmol/L (135 mg/dL), TG < 4.52 mmol/L (400 mg/dL) and 10-year CHD risk $> 20\%$, history of CHD, atherosclerosis</p> <p>1002 participants received rosuvastatin, 504 received atorvastatin</p> <p>Exclusion criteria: FH, dysbetalipoproteinaemia, secondary dyslipidaemia of any cause, uncontrolled diabetes mellitus or HTN, unstable CVD, active hepatic disease or hepatic dysfunction, AST or ALT $\geq 1.5 \times$ ULN, CK $> 3 \times$ ULN, childbearing potential, pregnant or breastfeeding, use of lipid-modifying agents, agents known to interact with statins and increase risk for muscular adverse events</p> <p>Naive atorvastatin baseline TC: 6.75 mmol/L (261 mg/dL) Naive atorvastatin baseline LDL-C: 4.57 mmol/L (177 mg/dL) Naive atorvastatin baseline HDL-C: 1.25 mmol/L (48 mg/dL) Naive atorvastatin baseline TG: 2.06 mmol/L (182 mg/dL)</p>
Interventions	Naive atorvastatin 10 mg/d Switched atorvastatin 10 mg/d Naive rosuvastatin 10 mg/d Switched rosuvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Naive atorvastatin group was analysed

Risk of bias
Atorvastatin for lowering lipids (Review)

DISCOVERY ALPHA 2006 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Naive atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Naive atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Naive atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	214/504 were not analysed because 185 participants in the non-naive group did not have a wash-out dietary stabilisation period and 29 participants did not receive at least 1 dose of atorvastatin
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca partially funded the study; data may support bias against atorvastatin

Dobreanu 2007

Methods	4-Week wash-out baseline period 8-Week before-and-after study
Participants	22 participants with unstable angina and 10 with stable CAD $130 \leq \text{LDL-C} \leq 160$ Exclusion criteria: TG ≥ 400 mg/dL (4.52 mmol/L), CPK and alanine aminotransferase $\geq 3 \times \text{ULN}$, creatinine ≥ 2 mg/dL, myopathy, nephrotic syndrome, diabetes, pancreatitis, smoking, obesity. Initial C-reactive protein ≤ 8 mg/dL and a marked increase after 1 month (≥ 25 mg/L) suggest the possibility of acute infection and were excluded from the statistical analysis Baseline TC: 6.10 mmol/L (236 mg/dL) Baseline LDL-C: 3.87 mmol/L (150 mg/dL) Baseline HDL-C: 1.27 mmol/L (49 mg/dL) Baseline TG: 1.86 mmol/L (165 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 4 weeks and 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Dobreanu 2007 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	12/22 were not included in the efficacy analysis (TC and LDL-C were not measured in unstable angina patients); 55% of participants were excluded from the efficacy analysis Risk of bias was high
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Dogra 2007

Methods	4-Week run-in period 6-Week double-blind randomised placebo-controlled parallel study
Participants	119 men and women with stage 3 to 5 chronic kidney disease 40 participants received placebo, 39 received atorvastatin, 40 received gemfibrozil Exclusion criteria: individuals with nephrotic range proteinuria, bilateral arteriovenous fistulas, abnormal liver function test results, CK > 2 × ULN, alcohol abuse, active upper gastrointestinal dyspepsia, a clinical cardiovascular event within the preceding 6 months, anticoagulant or immunosuppressant use, statin or fibrate intolerance Placebo baseline TC: 5.09 mmol/L (197 mg/dL) Placebo baseline LDL-C: 2.90 mmol/L (112 mg/dL) Atorvastatin baseline TC: 5.90 mmol/L (229 mg/dL) Atorvastatin baseline LDL-C: 3.59 mmol/L (139 mg/dL)
Interventions	Placebo Atorvastatin 40 mg/d Gemfibrozil 600 mg BID
Outcomes	Per cent change from baseline at 6 weeks of serum TC and LDL-C
Notes	Placebo and atorvastatin monotherapy groups were analysed SDs were imputed WDAEs were reported

Risk of bias

Bias	Authors' judgement	Support for judgement
------	--------------------	-----------------------

Dogra 2007 (Continued)

Random sequence generation (selection bias)	Low risk	"Block randomization using random number tables"
Allocation concealment (selection bias)	Low risk	"Performed by a clinical trials pharmacist"
Blinding (performance bias and detection bias) All outcomes	Low risk	"A double-blind" "All investigators, patients, renal staff, and the vascular function technician were blinded to treatment allocation"
Incomplete outcome data (attrition bias) All outcomes	High risk	<p>Placebo: 8/40 were not included in the efficacy analysis because of adverse events</p> <p>Atorvastatin: 8/39 were not included in the efficacy analysis because of adverse events</p> <p>20% of participants were excluded from the efficacy analysis</p> <p>Risk of bias was high</p>
Selective reporting (reporting bias)	High risk	HDL-C and TG data were not reported
Other bias	High risk	Pfizer partially funded the study; data may support bias for atorvastatin

ECLIPSE 2008

Methods	6-Week dietary lead-in period 24-Week open-label randomised parallel-group study
Participants	1036 men and women ≥ 18 years; hypercholesterolaemia and a history of CHD, clinical evidence of atherosclerosis or a 10-year CHD risk score $> 20\%$, $160 \leq \text{LDL-C} < 250$ mg/dL ($4.14 \leq \text{LDL-C} < 6.47$ mmol/L and within 15% of each other), TG < 400 mg/dL (4.52 mmol/L) 514 participants received atorvastatin, 522 received rosuvastatin Atorvastatin baseline TC: 7.15 mmol/L (276 mg/dL) Atorvastatin baseline LDL-C: 4.89 mmol/L (189 mg/dL) Atorvastatin baseline HDL-C: 1.34 mmol/L (52 mg/dL) Atorvastatin baseline TG: 2.00 mmol/L (177 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 6 weeks Atorvastatin 20 mg/d for 6 to 12 weeks Atorvastatin 40 mg/d for 12 to 18 weeks Atorvastatin 80 mg/d for 18 to 24 weeks Rosuvastatin 10 mg/d for 0 to 6 weeks Rosuvastatin 20 mg/d for 6 to 12 weeks Rosuvastatin 40 mg/d for 12 to 24 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	4/514 were not included in the efficacy analysis because no post-treatment lipid value was provided 0.7% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Economides 2004

Methods	<p>Wash-out was not required because participants were excluded if they received lipid-lowering drugs within 3 months of the study</p> <p>3-Month randomised double-blind placebo-controlled trial</p>
Participants	<p>77 men and women from USA with diabetes or at risk of diabetes aged 51 years (21-80); BMI 29.65</p> <p>Exclusion criteria: cardiac arrhythmia, congestive heart failure, uncontrolled HTN, recent stroke, chronic renal disease, severe dyslipidaemia or other serious chronic disease requiring active treatment, participants taking glucocorticoids, antineoplastic agents, psychoactive drugs and bronchodilators, type 2 diabetes and at risk of type 2 diabetes groups combined</p> <p><u>Placebo:</u></p> <p>Baseline TC: 5.48 mmol/L (212 mg/dL) Baseline LDL-C: 3.28 mmol/L (127 mg/dL) Baseline HDL-C: 1.61 mmol/L (62 mg/dL) Baseline TG: 1.25 mmol/L (111 mg/dL)</p> <p><u>Atorvastatin:</u></p> <p>Baseline TC: 5.16 mmol/L (200 mg/dL) Baseline LDL-C: 3.10 mmol/L (120 mg/dL) Baseline HDL-C: 1.51 mmol/L (58 mg/dL) Baseline TG: 1.29 mmol/L (114 mg/dL)</p>
Interventions	Placebo

Economides 2004 (Continued)

Atorvastatin 20 mg/d

Outcomes Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG

 Notes No WDAEs were reported
 SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind fashion"
Incomplete outcome data (attrition bias) All outcomes	High risk	10/77 participants were not analysed 19% of participants were excluded from the efficacy analysis Risk of bias is quite high
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	High risk	Pfizer partially funded the study; data may support bias for the drug

Farnier 2000

Methods	6-Week wash-out period 6-Week multi-centre randomised open-label study Randomisation was unbalanced, 2:2:1 ratio Evening dose
Participants	272 men and women from France recruited from lipid clinics and general practitioner centres with hypercholesterolaemia, mean age 50 years (18-70); LDL \geq 4.1 mmol/L (159 mg/dL), TG \leq 3.4 mmol/L (301 mg/dL) 109 participants received atorvastatin, 163 received simvastatin Exclusion criteria: pregnancy threat, secondary hyperlipidaemia, major CVD within 6 months of study, uncontrolled HTN, BMI > 30, statin hypersensitivities, alcohol abuse Atorvastatin baseline TC: 8.25 mmol/L (319 mg/dL) Atorvastatin baseline LDL-C: 6.39 mmol/L (247 mg/dL) Atorvastatin baseline HDL-C: 1.14 mmol/L (44.08 mg/dL) Atorvastatin baseline TG: 1.69 mmol/L (1 mg/dL)
Interventions	Atorvastatin 10 mg/d Simvastatin 10 mg/d Simvastatin 20 mg/d

Atorvastatin for lowering lipids (Review)

Farnier 2000 (Continued)

Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	Atorvastatin group was analysed	
Risk of bias		
Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Ferreira 2007

Methods	No current or past use of hypolipidaemic drugs in the past 6 months 8-Week before-and-after trial
Participants	91 women with systemic lupus erythematosus; three were excluded for reasons not related to the therapeutic protocol; 88 participants completed the study 64 participants received atorvastatin, 24 control participants received no atorvastatin Exclusion criteria: menopausal status, diabetes mellitus, serum creatinine > 1.2 mg/dL, pregnancy, smoking status in the past 12 months, family history of CHD, skeletal myopathic disease, elevated CK, hepatic disease, use of cyclosporine Atorvastatin baseline TC: 4.20 mmol/L (162 mg/dL) Atorvastatin baseline LDL-C: 2.38 mmol/L (92 mg/dL) Atorvastatin baseline HDL-C: 1.22 mmol/L (47 mg/dL) Atorvastatin baseline TG: 1.30 mmol/L (50 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Ferreira 2007 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Franiak-Pietryga 2009

Methods	8-Week wash-out dietary stabilisation period 12-Week before-and-after trial
Participants	20 menopausal women with metabolic syndrome aged 55 years; TG > 150 mg/dL (1.7 mmol/L), HDL-C < 50 mg/dL (1.3 mmol/L) Exclusion criteria: none Atorvastatin baseline TC: 7.25 mmol/L (280 mg/dL) Atorvastatin baseline LDL-C: 4.80 mmol/L (186 mg/dL) Atorvastatin baseline HDL-C: 1.11 mmol/L (43 mg/dL) Atorvastatin baseline TG: 2.76 mmol/L (244 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 4 and 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Franiak-Pietryga 2009 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not stated

Fu 2013

Methods	4-Week lead-in dietary phase 4-Week open study
Participants	363 men and women with hyperlipidaemia aged 41 to 78 years TG > 1.78 mmol/L (158 mg/dL), total cholesterol > 6.00 mmol/L (232 mg/dL), LDL-C > 3.36 mmol/L (130 mg/dL) 189 participants received atorvastatin, 174 received simvastatin Exclusion criteria: unstable or uncontrolled clinically significant disease, uncontrolled hypothyroidism or diabetes, hepatic and renal dysfunction Atorvastatin baseline TC: 7.09 mmol/L (274 mg/dL) Atorvastatin baseline LDL-C: 3.62 mmol/L (140 mg/dL) Atorvastatin baseline HDL-C: 1.65 mmol/L (63.8 mg/dL) Atorvastatin baseline TG: 1.93 mmol/L (171 mg/dL)
Interventions	Atorvastatin 20 mg/d Simvastatin 20 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Atorvastatin for lowering lipids (Review)

Fu 2013 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	Industry did not fund the study

Geiss 2001

Methods	6-Week wash-out period 4-Week before-and-after study
Participants	9 hypercholesterolaemic individuals from Germany, LDL \geq 200 mg/dL (5.17 mmol/L); 11 type 2 diabetes mellitus, LDL-C \geq 125 mg/dL (3.23 mmol/L); 10 normolipidaemic controls LDL-C < 150 mg/dL (3.88 mmol/L) Exclusion criteria: none Baseline TC: 6.40 mmol/L (247 mg/dL) Baseline LDL: 4.30 mmol/L (166 mg/dL) Baseline HDL: 1.22 mmol/L (47 mg/dL) Baseline TG: 2.03 mmol/L (180 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported

Geiss 2001 (Continued)

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Gokkaya 2008

Methods	1-Month wash-out period 1-Month before-and-after study
Participants	25 men with hypercholesterolaemia, TC > 200 mg/dL Exclusion criteria: individuals with hormonal or neurogenic pathologies, previous treatment with sildenafil and a normal penile vascular system after penile duplex ultrasonography investigation, cardiac instability Baseline TC: 6.28 mmol/L (243 mg/dL) Baseline LDL-C: 4.55 mmol/L (176 mg/dL) Baseline HDL-C: 1.31 mmol/L (50.6 mg/dL) Baseline TG: 2.45 mmol/L (217 mg/dL)
Interventions	Atorvastatin 10 mg/d Atorvastatin 10 mg/d + sildenafil 200 mg/wk
Outcomes	Per cent change from baseline at 1 month of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin 10 mg/d + sildenafil 200 mg/wk group was not analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured

Gokkaya 2008 (Continued)

Other bias	Unclear risk	The source of funding was not provided
------------	--------------	--

Goldberg 2009

Methods	6-Week diet run-in period 12-Week phase 3 multi-centre double-blind active-controlled study
Participants	613 men and women aged ≥ 18 years with mixed dyslipidaemia; TG ≥ 150 mg/dL (1.69 mmol/L), HDL-C < 40 mg/dL (1.03 mmol/L) for men and < 50 mg/dL (1.29 mmol/L) for women, LDL-C ≥ 130 mg/dL (3.36 mmol/L) 113 participants received atorvastatin 20 mg/d, 110 received atorvastatin 40 mg/d, 56 received atorvastatin 80 mg/d, 113 received ABT-335, 110 received ABT-335 + atorvastatin 20 mg/d, 111 received ABT-335 + atorvastatin 40 mg/d Exclusion criteria: pregnancy, unstable CHD, type 1 diabetes mellitus, history of diabetic ketoacidosis, unstable type 2 diabetes mellitus with haemoglobin A1c $> 8.5\%$ or history of diagnosed myopathy, use of prohibited medications Baseline atorvastatin TC: 6.73 mmol/L (260 mg/dL) Baseline atorvastatin LDL-C: 4.11 mmol/L (159 mg/dL) Baseline atorvastatin HDL-C: 1.00 mmol/L (39 mg/dL) Baseline atorvastatin TG: 3.09 mmol/L (274 mg/dL)
Interventions	Atorvastatin 20 mg/d Atorvastatin 40 mg/d Atorvastatin 80 mg/d ABT-335 for 0 to 12 weeks ABT-335 + atorvastatin 20 mg/d ABT-335 + atorvastatin 40 mg/d
Outcomes	Per cent change from baseline at 12 weeks for serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin groups were analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Goldberg 2009 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	<p>Atorvastatin 20 mg/d: TC 4/113 were not included in the efficacy analysis, resulting in 109 in the full analysis set</p> <p>LDL-C: 6/109 values were not reported</p> <p>HDL-C: 8/109 values were not reported</p> <p>TG: 1/109 value was not reported</p> <p>Atorvastatin 40 mg/d: TC and TG 4/109 were not included in the efficacy analysis, resulting in 105 in the full analysis set</p> <p>LDL-C: 10/105 values were not reported</p> <p>HDL-C: 13/105 values were not reported</p> <p>Atorvastatin 80 mg/d: TC 4/56 were not included in the efficacy analysis, resulting in 52 in the full analysis set</p>
Selective reporting (reporting bias)	High risk	<p>All lipid parameters were reported for atorvastatin 20 and 40 mg/d</p> <p>LDL-C, HDL-C and TG were not reported for atorvastatin 80 mg/d</p>
Other bias	High risk	Abbott funded the study; data may support bias against atorvastatin

Goudevenos 2000

Methods	6-Week wash-out period 24-Week open-label single-centre study Evening dose
Participants	<p>90 men and women from Greece were recruited from a lipid clinic with dyslipidaemia, mean age 48 years; BMI \leq 32, LDL-C $>$ 4.16 mmol/L (161 mg/dL), TG $>$ 2.26 mmol/L (200 mg/dL)</p> <p>Exclusion criteria: smokers, hepatic and renal dysfunction, proteinuria, diabetes, raised TSH, drugs that affect lipid parameters</p> <p>Baseline TC: 8.07 mmol/L (312 mg/dL)</p> <p>Baseline LDL-C: 5.69 mmol/L (220 mg/dL)</p> <p>Baseline HDL-C: 1.16 mmol/L (44.86 mg/dL)</p> <p>Baseline TG: 2.71 mmol/L (240 mg/dL)</p>
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	Only LDL-C was measured
Other bias	Unclear risk	The study was funded by Kowa Research Europe Ltd

Guo 2013

Methods	<p>Participants were not taking any lipid medications within 4 weeks of the trial</p> <p>8-Week before-and-after trial</p>
Participants	<p>32 participants with atherosclerosis aged 18 to 70 years</p> <p>19 participants received atorvastatin 10 mg/d, 13 received atorvastatin 20 mg/d</p> <p>Exclusion criteria: TG \geq 500 mg/dL (5.6 mmol/L), previous coronary syndrome within 1 month, serious heart failure or arrhythmia, infectious disease within 1 month, hepatic and renal dysfunction, au-</p>

Atorvastatin for lowering lipids (Review)

Guo 2013 (Continued)

to immune disease, cancer, pregnancy or lactation, psychiatric disorders, ALT or AST > 3 × ULN, creatine phosphokinase > 5 × ULN

Atorvastatin 10 mg/d baseline TC: 4.93 mmol/L (191 mg/dL)
 Atorvastatin 10 mg/d baseline LDL-C: 3.03 mmol/L (117 mg/dL)
 Atorvastatin 10 mg/d baseline HDL-C: 1.19 mmol/L (46.0 mg/dL)
 Atorvastatin 10 mg/d baseline TG: 2.18 mmol/L (193 mg/dL)

Atorvastatin 20 mg/d baseline TC: 4.73 mmol/L (183 mg/dL)
 Atorvastatin 20 mg/d baseline LDL-C: 3.17 mmol/L (123 mg/dL)
 Atorvastatin 20 mg/d baseline HDL-C: 1.02 mmol/L (39.4 mg/dL)
 Atorvastatin 20 mg/d baseline TG: 2.13 mmol/L (189 mg/dL)

Interventions	Atorvastatin 10 mg/d Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 4 to 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d and 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d and 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d and 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	Industry did not fund the trial

Han 2008

Methods	4-Week run-in dietary stabilisation period 4-Week single-blind randomised trial
Participants	67 aged hypercholesterolaemic individuals with LDL-C 4.14 to 6.50 mmol/L (160-251 mg/dL), TG ≤ 4.52 mmol/L (400 mg/dL) 34 participants received atorvastatin, 33 received rosuvastatin

Han 2008 (Continued)

Exclusion criteria: cardiovascular or cerebrovascular events within 3 months before randomisation, hypersensitivity to statins, liver disease, kidney disease, radiotherapy or chemotherapy, drug or alcohol abuse, serious medical conditions

Atorvastatin baseline TC: 5.2 mmol/L (201 mg/dL)
 Atorvastatin baseline LDL-C: 3.3 mmol/L (128 mg/dL)
 Atorvastatin baseline HDL-C: 1.23 mmol/L (48 mg/dL)
 Atorvastatin baseline TG: 1.6 mmol/L (142 mg/dL)

Interventions	Atorvastatin 20 mg/d Rosuvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	1/34 participants was not included in the efficacy analysis 3% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Harangi 2009

Methods	6-Week dietary baseline stabilisation period 3-Month before-and-after study
Participants	33 non-smoking men and women aged 21 to 70 years; untreated type IIa and IIb hyperlipidaemia Exclusion criteria: hepatic, endocrine or renal disorders; type 2 diabetes mellitus; alcohol and drug abuse; gallstones; cancer; pregnancy or lactation; anticoagulant or use of lipid-lowering therapy Baseline TC: 6.68 mmol/L (258 mg/dL) Baseline LDL-C: 4.39 mmol/L (170 mg/dL) Baseline HDL-C: 1.49 mmol/L (58 mg/dL)

Atorvastatin for lowering lipids (Review)

Harangi 2009 (Continued)

Baseline TG: 1.75 mmol/L (155 mg/dL)

Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

HD-ROWS 2012

Methods	No wash-out was required because participants were not receiving any lipid-altering agents 8-Week randomised double-blind parallel-group study
Participants	23 men and women aged 18 to 65 years with documented dyslipidaemia LDL-C > 100 mg/dL (2.59 mmol/L) and TG < 200 mg/dL (2.26 mmol/L) Exclusion criteria: HMG-CoA reductase sensitivity or intolerance, coronary heart disease, diabetes mellitus, hypothyroidism, concurrent use of interacting agents, hepatic disease, renal disease, any medical or psychological condition that would interfere with the study, pregnancy or threat of pregnancy Baseline TC: 5.79 mmol/L (224 mg/dL) Baseline LDL-C: 3.67 mmol/L (142 mg/dL) Baseline HDL-C: 1.267 mmol/L (49 mg/dL) Baseline TG: 1.48 mmol/L (131 mg/dL)
Interventions	Atorvastatin 10 mg/d Rosuvastatin 80 mg/wk
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG

Atorvastatin for lowering lipids (Review)

HD-ROWS 2012 (Continued)

Notes SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	3/13 = 23.1% of participants were not included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not reported

HeFH 2003

Methods	6-Week wash-out period 18-Week multi-centre randomised double-blind parallel-group study
Participants	623 men and women from North America with heterozygous FH aged 19 to 79 years; LDL-C > 190 mg/dL (4.91 mmol/L), TC > 290 mg/dL (7.5 mmol/L), TG < 400 mg/dL (4.5 mmol/L) 187 participants received atorvastatin, 436 received rosuvastatin Exclusion criteria: hepatic impairment, active arterial disease, uncontrolled HTN, uncontrolled hypothyroidism, CK increase > 3 × ULN, renal dysfunction, HRT, any medication that affects serum lipids or with potential safety issue with regard to drug-drug interactions Atorvastatin baseline TC: 9.49 mmol/L (367 mg/dL) Atorvastatin baseline LDL-C: 7.45 mmol/L (288 mg/dL) Atorvastatin baseline HDL-C: 1.22 mmol/L (47 mg/dL) Atorvastatin baseline TG: 1.79 mmol/L (159 mg/dL)
Interventions	Atorvastatin 20 mg/d for 0 to 6 weeks Atorvastatin conditional titration to 40 mg/d for 6 to 12 weeks Atorvastatin conditional titration to 80 mg/d for 12 to 18 weeks Rosuvastatin 20 mg/d for 0 to 6 weeks Rosuvastatin conditional titration 40 mg/d for 6 to 12 weeks Rosuvastatin conditional titration 80 mg/d for 12 to 18 weeks

Atorvastatin for lowering lipids (Review)

HeFH 2003 (Continued)

Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Her 2010

Methods	4-Week wash-out dietary stabilisation period 8-Week before-and-after study
Participants	Men and women aged 20 to 79 years; LDL-C > 130 mg/dL (3.36 mmol/L), TG < 400 mg/dL (4.52 mmol/L) Exclusion criteria: FH, diabetes mellitus, pregnant or breastfeeding women, stroke or MI within 3 months, thyroid dysfunction, cancer Atorvastatin baseline TC: 6.49 mmol/L (251 mg/dL) Atorvastatin baseline LDL-C: 4.34 mmol/L (168 mg/dL) Atorvastatin baseline HDL-C: 1.30 mmol/L (50 mg/dL) Atorvastatin baseline TG: 1.87 mmol/L (166 mg/dL)
Interventions	Atorvastatin 20 mg/d Rosuvastatin 10 mg/d Atorvastatin/ezetimibe 5 mg/5 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias
Atorvastatin for lowering lipids (Review)

Her 2010 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Hernandez 2011

Methods	<p>Wash-out was not required because participants were not receiving lipid-lowering therapy within the past 3 months</p> <p>4-Week double-blind randomised placebo-controlled trial</p>
Participants	<p>63 men and women with hypercholesterolaemia aged 45 to 75 years</p> <p>Exclusion criteria: receiving anti-inflammatory agents, pregnancy, acute or chronic infection, diabetes mellitus, cancer, liver disease, connective tissue disease, renal failure</p> <p><u>Placebo:</u></p> <p>Baseline TC: 6.59 mmol/L (255 mg/dL) Baseline LDL-C: 4.34 mmol/L (168 mg/dL) Baseline HDL-C: 1.42 mmol/L (55 mg/dL)</p> <p><u>Atorvastatin 10 mg/d:</u></p> <p>Baseline TC: 6.31 mmol/L (244 mg/dL) Baseline LDL-C: 4.19 mmol/L (162 mg/dL) Baseline HDL-C: 1.4 mmol/L (54 mg/dL)</p> <p><u>Atorvastatin 40 mg/d:</u></p> <p>Baseline TC: 6.7 mmol/L (259 mg/dL) Baseline LDL-C: 4.5 mmol/L (174 mg/dL) Baseline HDL-C: 1.47 mmol/L (57 mg/dL)</p>
Interventions	<p>Placebo</p> <p>Atorvastatin 10 mg/d</p> <p>Atorvastatin 40 mg/d</p>

Atorvastatin for lowering lipids (Review)

Hernandez 2011 (Continued)

Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C and HDL-C
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Information about the sequence generation process was insufficient to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	Information about the allocation concealment process was insufficient to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	Low risk	4/66 = 6.1% did not finish the trial
Selective reporting (reporting bias)	High risk	TG data and withdrawal due to adverse events data were not reported
Other bias	High risk	Pfizer partially funded the study

Herregods 2008

Methods	4-Week dietary wash-out period 24-Week open-label randomised 2-arm parallel-group multi-centre study
Participants	938 men and women aged ≥ 18 years; type IIa and type IIb hypercholesterolaemia and 10-year cardiovascular risk $> 20\%$ or type 2 diabetes or history of CHD or other established atherosclerotic disease; LDL-C > 3.5 mmol/L (> 135 mg/dL) for naive participants 459 participants received atorvastatin, 479 received rosuvastatin Exclusion criteria: history of a serious adverse event with another HMG-CoA reductase inhibitor, active liver disease, unstable CVD, severe renal or hepatic impairment, use of cyclosporine or any disallowed drug Atorvastatin baseline TC: 6.61 mmol/L (256 mg/dL) Atorvastatin baseline LDL-C: 4.38 mmol/L (169 mg/dL) Atorvastatin baseline HDL-C: 1.38 mmol/L (53 mg/dL) Atorvastatin baseline TG: 1.86 mmol/L (165 mg/dL)
Interventions	Atorvastatin 10 mg/d Rosuvastatin 10 mg/d Atorvastatin 10 mg/d for 0 to 12 weeks, then switched to rosuvastatin for 12 to 24 weeks Rosuvastatin 10 mg/d Rosuvastatin 20 mg/d

Atorvastatin for lowering lipids (Review)

Herregods 2008 (Continued)

Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Unswitched atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	72/479 were not included in the efficacy analysis (72 were treated with usual Belux starting dose) 15% of participants were excluded from the efficacy analysis Risk of bias is high
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	Dr Vandenhoven and Dr Vissers are employees of AstraZeneca The source of funding was not provided

Hogue 2008a

Methods	6-Week wash-out period 6-Week randomised double-blind study
Participants	11 men with type 2 diabetes mellitus TG (2.3-8.1 mmol/L) 6 participants received atorvastatin, 5 received fenofibrate Exclusion criteria: CVD, microalbuminuria, genetic conditions that affect serum lipids, uncontrolled hypothyroidism, nephrotic syndrome, anorexia nervosa, statin hypersensitivity, alcohol or drug abuse, uncontrolled diabetes mellitus; persistent elevation of ALT, AST, CPK; uncontrolled endocrine or metabolic disease, mental health issues, HIV positive Atorvastatin baseline TC: 6.25 mmol/L (242 mg/dL) Atorvastatin baseline LDL-C: 2.61 mmol/L (101 mg/dL) Atorvastatin baseline HDL-C: 0.73 mmol/L (28 mg/dL) Atorvastatin baseline TG: 5.07 mmol/L (449 mg/dL)
Interventions	Atorvastatin 20 mg/d

Atorvastatin for lowering lipids (Review)

Hogue 2008a (Continued)

Fenofibrate 200 mg/d

Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin

Hoogerbrugge 1998

Methods	6-Week wash-out period 12-Week open-label single-centre study
Participants	41 men and women from the Netherlands with FH from an outpatient lipid clinic of a tertiary referral centre, LDL-C > 5.0 mmol/L (193 mg/dL) Exclusion criteria: none reported Baseline TC: 10.2 mmol/L (394 mg/dL) Baseline LDL-C: 7.69 mmol/L (297 mg/dL) Baseline HDL-C: 1.22 mmol/L (47 mg/dL) Baseline TG: 2.52 mmol/L (223 mg/dL)
Interventions	Atorvastatin 40 mg/d for 0 to 6 weeks Atorvastatin 80 mg/d for 6 to 12 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed SD was imputed for HDL-C

Hoogerbrugge 1998 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Hoogerbrugge 1999

Methods	6-Week wash-out period 12-Week before-and-after study
Participants	40 men and women from the Netherlands, mean age 42 years; hypercholesterolaemia, LDL-C > 6 mmol/L (232 mg/dL), tendon xanthomas in participant or first-degree relative Exclusion criteria: none reported Baseline TC: 10.23 mmol/L (396 mg/dL) Baseline LDL-C: 8.07 mmol/L (312 mg/dL) Baseline HDL-C: 1.31 mmol/L (50.66 mg/dL) Baseline TG: 2.14 mmol/L (190 mg/dL)
Interventions	Atorvastatin 40 mg/d for 0 to 6 weeks Atorvastatin 80 mg/d for 6 to 12 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Atorvastatin for lowering lipids (Review)

Hoogerbrugge 1999 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Huang 2012

Methods	Participants were not receiving lipid-altering medications within 1 month of the study; no wash-out was required 3-Month quasi-randomised trial	
Participants	80 elderly participants with type 2 diabetes mellitus - 60 years old 40 participants received atorvastatin 20 mg/d, 40 received pitavastatin 2 mg/d Exclusion criteria: type 1 diabetes, statin allergies, homozygous familial hypercholesterolaemia, active liver disease, AST or ALT 3 × ULN, individuals receiving immunosuppressants, severe kidney disease, severe cardiovascular and cerebrovascular diseases, acute heart failure, critically ill individuals, severe infection, hyperthyroidism, cancer, psychiatric problems Baseline atorvastatin TC: 4.37 mmol/L (169 mg/dL) Baseline atorvastatin LDL-C: 2.96 mmol/L (114 mg/dL) Baseline atorvastatin HDL-C: 1.13 mmol/L (43.7 mg/dL) Baseline atorvastatin TG: 1.61 mmol/L (143 mg/dL)	
Interventions	Atorvastatin 20 mg/d Pitavastatin 2 mg/d	
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG	
Notes	Atorvastatin 20 mg/d; intervention was analysed SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Huang 2012 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	2/40 (5%) participants were not included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not reported

Hufnagel 2000

Methods	No wash-out period was required because participants did not receive hypolipidaemic treatment in the previous 3 months 4-Week before-and-after study	
Participants	31 individuals from France with hypercholesterolaemia aged < 80 years Exclusion criteria: statin allergy, liver disease, alcohol abuse, hypothyroidism, severe progressive disease, cachexia Baseline TC: 7.65 mmol/L (296 mg/dL) Baseline LDL-C: 5.22 mmol/L (202 mg/dL) Baseline HDL-C: 1.16 mmol/L (45 mg/dL) Baseline TG: 2.96 mmol/L (262 mg/dL)	
Interventions	Atorvastatin 10 mg/d	
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement

Hufnagel 2000 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	2/31 were not analysed because they withdrew as the result of adverse effects 6.5% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not reported

Hunninghake 1998

Methods	4-Week wash-out period 54-Week multi-centre open-label randomised drug parallel-group study
Participants	344 men and women from the USA with risk factors for CHD from primary, lipid and cardiology centres, aged 18 to 80 years; BMI ≤ 32 Exclusion criteria: hypersensitivities to reductase inhibitors, drugs that affect lipid metabolism, pregnancy or lactation, secondary hyperlipoproteinaemia, active liver disease or hepatic dysfunction, cardiovascular events or interventions within 1 month of screening, participation in another clinical study, significant abnormalities that the investigator judged could compromise the individual's safety or successful participation in the study Atorvastatin baseline TC: 7.70 mmol/L (286 mg/dL) Atorvastatin baseline LDL-C: 5.30 mmol/L (205 mg/dL) Atorvastatin baseline HDL-C: 1.09 mmol/L (42.15 mg/dL) Atorvastatin baseline TG: 2.14 mmol/L (190 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 12 weeks Atorvastatin 20 mg/d for 12 to 24 weeks Atorvastatin 40 mg/d for 24 to 36 weeks Atorvastatin 80 mg/d for 36 to 48 weeks Atorvastatin 80 mg/d + colestipol 5 g BID for 48 to 54 weeks Simvastatin 10 mg/d for 0 to 12 weeks Simvastatin 20 mg/d for 12 to 24 weeks Simvastatin 40 mg/d for 24 to 36 weeks Simvastatin 40 mg/d + colestipol 5 g BID for 36 to 48 weeks Simvastatin 40 mg/d + colestipol 10 g BID for 48 to 54 weeks Lovastatin 20 mg/d for 0 to 12 weeks Lovastatin 40 mg/d for 12 to 24 weeks Lovastatin 80 mg/d for 24 to 36 weeks Lovastatin 80 mg/d + colestipol 5 g BID 36 to 48 weeks Lovastatin 80 mg/d + colestipol 10 g BID 48 to 54 weeks Fluvastatin 20 mg/d for 0 to 12 weeks Fluvastatin 40 mg/d for 12 to 24 weeks

Hunninghake 1998 (Continued)

Fluvastatin 40 mg/d + colestipol 5 g BID for 24 to 36 weeks

Fluvastatin 40 mg/d + colestipol 10 g BID for 36 to 54 weeks

Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	1/86 participants was not included in the efficacy analysis 1.1% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Hunninghake 2001a

Methods	8-Week wash-out period 6-Week multi-centre randomised open-label study Evening dose
Participants	215 men and women from the USA with primary hypercholesterolaemia, mean age 56.5 years (18-80); BMI \leq 32, LDL \geq 4.14 mmol/L (160 mg/dL), TG \leq 4.52 mmol/L (400 mg/dL) 108 participants received atorvastatin, 107 received cerivastatin Exclusion criteria: women who are likely to become pregnant, secondary hyperlipoproteinaemia, renal or hepatic dysfunction, type 1 diabetes, uncontrolled type 2 diabetes, uncontrolled HTN, alcohol abuse, unstable CVD, lipid-altering drug usage, statin hypersensitivity, immunosuppressants Atorvastatin baseline TC: 7.48 mmol/L (289 mg/dL) Atorvastatin baseline LDL-C: 5.25 mmol/L (203 mg/dL) Atorvastatin baseline HDL-C: 1.3 mmol/L (50.27 mg/dL) Atorvastatin baseline TG: 2.03 mmol/L (180 mg/dL)
Interventions	Atorvastatin 10 mg/d Cerivastatin 0.3 mg/d

Atorvastatin for lowering lipids (Review)

Hunninghake 2001a (Continued)

Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer Inc funded the study; data may support bias for atorvastatin

Hunninghake 2001b

Methods	4-Week wash-out period 4-Week multi-centre double-blind randomised placebo-controlled parallel-group study
Participants	<p>94 men and women from the USA with moderate hypercholesterolaemia aged 28 to 79 years; LDL \geq 160 mg/dL (4.14 mmol/L)</p> <p>19 participants received placebo, 17 received colesvelam, 19 received atorvastatin 10 mg/d, 20 received atorvastatin 80 mg/d, 19 received colesvelam + atorvastatin</p> <p>Exclusion criteria: women who were likely to become pregnant, dysphagia, swallowing or intestinal motility disorders, any medically unstable condition</p> <p>Placebo baseline TC: 6.80 mmol/L (263 mg/dL) Placebo baseline LDL-C: 4.77 mmol/L (184 mg/dL) Placebo baseline HDL-C: 1.20 mmol/L (46 mg/dL) Placebo baseline TG: 1.70 mmol/L (151 mg/dL)</p> <p>Atorvastatin 10 mg/d baseline TC: 6.94 mmol/L (268 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.71 mmol/L (182 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.27 mmol/L (49 mg/dL) Atorvastatin 10 mg/d baseline TG: 2.00 mmol/L (177 mg/dL)</p> <p>Atorvastatin 80 mg/d baseline TC: 6.84 mmol/L (265 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 4.71 mmol/L (182 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.21 mmol/L (47 mg/dL) Atorvastatin 80 mg/d baseline TG: 1.73 mmol/L (153 mg/dL)</p>

Atorvastatin for lowering lipids (Review)

Hunninghake 2001b (Continued)

Interventions	Placebo for 0 to 4 weeks Atorvastatin 10 mg/d for 0 to 4 weeks Atorvastatin 80 mg/d for 0 to 4 weeks Atorvastatin 10 mg/d + colesevelam 3.8 g/d for 0 to 4 weeks Colesevelam 3.8 g/d for 0 to 4 weeks
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Placebo and atorvastatin monotherapy groups were analysed HDL-C and TG were not analysed because the per cent change from baseline was expressed as median WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Low risk	Placebo capsules were identical in appearance to active medications
Blinding (performance bias and detection bias) All outcomes	Low risk	"Placebo for colesevelam or atorvastatin was administered to monotherapy groups in order to satisfy the double-blind nature of the study"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Placebo: All 19 participants were included in the efficacy analysis Atorvastatin 10 mg/d: 1/19 was not included in the efficacy analysis because the participant was excluded from the ITT analysis Atorvastatin 80 mg/d: All 20 participants were included in the efficacy analysis 1.7% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	High risk	HDL-C and TG were not analysed; WDAEs were not measured
Other bias	High risk	GelTex Pharmaceuticals funded the study; data may result in bias against atorvastatin

Hunninghake 2003

Methods	4-Week wash-out period 36-Week multi-centre double-blind randomised study
Participants	Of the 826 randomly assigned participants, 813 men and women from the USA with or without metabolic syndrome in hypercholesterolaemia aged 21 to 70 years, were included in the ITT population. Information on 808 participants was sufficient to reveal metabolic syndrome status at baseline. 212 in the simvastatin group and 113 in the atorvastatin group met the criteria for metabolic syndrome. 193 in the simvastatin group and 295 in the atorvastatin group did not meet the criteria for metabolic syndrome. LDL \geq 160 mg/dL (4.14 mmol/L); TG < 350 mg/dL (3.95 mmol/L)

Hunninghake 2003 (Continued)

Exclusion criteria: types 1, 3-5 hyperlipidaemia, homozygous FH, type 1 or uncontrolled type 2 diabetes, renal and hepatic dysfunction, uncontrolled HTN and unstable cardiovascular conditions
 Atorvastatin baseline TC: 7.58 mmol/L (293 mg/dL)

Interventions	Atorvastatin 20 mg/d for 0 to 6 weeks Atorvastatin 40 mg/d for 6 to 12 weeks Atorvastatin 80 mg/d for 12 to 36 weeks Simvastatin 20 mg/d for 0 to 6 weeks Simvastatin 40 mg/d for 6 to 12 weeks Simvastatin 80 mg/d for 12 to 36 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC
Notes	First atorvastatin dose was analysed LDL-C, HDL-C and TG results from the original study by Illingworth 2001 were analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	Atorvastatin group of 408 from the Illingworth paper: 295/408 participants were missing because of non-metabolic syndrome 72.3% of participants were excluded from the efficacy analysis Risk of bias was high
Selective reporting (reporting bias)	Low risk	LDL-C, HDL-C and TG data were obtained from the Illingworth 2001 trial
Other bias	High risk	Merck funded the study; data may support bias against atorvastatin

Hwang 2004

Methods	Wash-out was not required because no participants were receiving any drug treatments at baseline 12-Week before-and-after study
Participants	22 patients from Taiwan with hypercholesterolaemia, TC > 220 mg/dL, LDL-C > 130 mg/dL Exclusion criteria: none

Atorvastatin for lowering lipids (Review)

Hwang 2004 (Continued)

Baseline TC: 6.65 mmol/L (257 mg/dL)
 Baseline LDL-C: 4.65 mmol/L (180 mg/dL)
 Baseline HDL-C: 1.06 mmol/L (41 mg/dL)
 Baseline TG: 1.59 mmol/L (141 mg/dL)

Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Ikewaki 2009

Methods	4-Week to 8-week run-in period 4-Week before-and-after study
Participants	26 men and women aged 40 to 75 years with hypercholesterolaemia; LDL-C \geq 140 mg/dL (3.62 mmol/L) Exclusion criteria: none Baseline TC: 7.45 mmol/L (288 mg/dL) Baseline LDL-C: 5.04 mmol/L (195 mg/dL) Baseline HDL-C: 1.60 mmol/L (62 mg/dL) Baseline TG: 1.80 mmol/L (159 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Atorvastatin for lowering lipids (Review)

Ikewaki 2009 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Astellas Pharmaceutical Co, a subsidiary of Pfizer, funded the study; data may support bias for atorvastatin

Illingworth 2001

Methods	4-Week wash-out period 36-Week multi-centre double-blind randomised parallel-group study
Participants	Of the 826 randomly assigned participants, 813 men and women from the USA aged 21 to 70 years; LDL-C > 4.2 mmol/L (162 mg/dL), TG < 4.0 mmol/L (354 mg/dL) 405 participants received simvastatin, 408 received atorvastatin Exclusion criteria: receiving immunosuppressants or drugs affecting lipid determinations, women likely to become pregnant No baseline TC values were reported Atorvastatin baseline LDL-C: 5.33 mmol/L (206 mg/dL) Atorvastatin baseline HDL-C: 1.31 mmol/L (50.66 mg/dL) Atorvastatin baseline TG: 2.00 mmol/L (177 mg/dL)
Interventions	Atorvastatin 20 mg/d for 0 to 6 weeks Atorvastatin 40 mg/d for 6 to 12 weeks Atorvastatin 80 mg/d for 12 to 36 weeks Simvastatin 20 mg/d for 0 to 6 weeks Simvastatin 40 mg/d for 6 to 12 weeks Simvastatin 80 mg/d for 12 to 36 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum LDL-C, HDL-C and TG

Atorvastatin for lowering lipids (Review)

Illingworth 2001 (Continued)

Notes	<p>First atorvastatin dose was analysed</p> <p>TC data from the Hunninghake 2003 paper were analysed</p> <p>SDs for imputed per cent change from baseline of TG were expressed as a median value, so this was not added to the dataset</p>
-------	--

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	TC data were obtained from the Hunninghake 2003 trial
Other bias	High risk	Merck & Co funded the study; data may support bias against atorvastatin

IRIS 2007

Methods	<p>6-Week wash-out period</p> <p>6-Week multi-centre randomised open-label parallel study</p>
Participants	<p>740 men and women from North America of South Asian ethnicity with hypercholesterolaemia, mean age 55 years (> 17 years); LDL-C < 300 mg/dL (7.8 mmol/L), TG < 500 mg/dL (5.6 mmol/L)</p> <p>369 participants received atorvastatin, 371 received rosuvastatin</p> <p>Exclusion criteria: type I, III or V hyperlipoproteinaemia; active arterial disease, uncontrolled HTN, poorly controlled diabetes mellitus, hepatic or renal dysfunction</p> <p>Atorvastatin baseline TC: 6.18 mmol/L (239 mg/dL) Atorvastatin baseline LDL-C: 4.07 mmol/L (157 mg/dL) Atorvastatin baseline HDL-C: 1.12 mmol/L (43.3 mg/dL) Atorvastatin baseline TG: 2.16 mmol/L (191.5 mg/dL)</p>
Interventions	<p>Atorvastatin 10 mg/d</p> <p>Atorvastatin 20 mg/d</p> <p>Rosuvastatin 10 mg/d</p> <p>Rosuvastatin 20 mg/d</p>

Atorvastatin for lowering lipids (Review)

IRIS 2007 (Continued)

Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin groups were analysed SDs were imputed for LDL-C and HDL-C

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin 10 mg/d: 5/185 participants were not included in the efficacy analysis because they were not included in the ITT group Atorvastatin 20 mg/d: 9/184 participants were not included in the efficacy analysis because they were not included in the ITT group 3.8% of participants were excluded from the ITT groups
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Issa 2012

Methods	4-Week wash-out period and 4-week placebo run-in period 12-Week randomised trial
Participants	87 non-smoking postmenopausal women with hypercholesterolaemia aged 50 to 65 years with no family history of coronary artery disease LDL-C > 130 mg/dL (3.36 mmol/L) 17 received atorvastatin 10 mg/d 34 received hormone therapy 36 received combined hormone therapy and atorvastatin Exclusion criteria: thyroid, liver or renal disease; diabetes, hypertriglyceridaemia Atorvastatin baseline TC: 7.24 mmol/L (280 mg/dL) Atorvastatin baseline LDL-C: 4.89 mmol/L (189 mg/dL) Atorvastatin baseline HDL-C: 1.47 mmol/L (57 mg/dL) Atorvastatin baseline TG: 1.99 mmol/L (176 mg/dL)

Issa 2012 (Continued)

Interventions	Atorvastatin 10 mg/d Hormone therapy Hormone therapy and atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin 10 mg/d; intervention was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	Industry did not fund the trial

J-CLAS 1997

Methods	4-Week wash-out 8-Week double-blind multi-centre randomised placebo-controlled study Evening doses
Participants	121 individuals from Japan with primary hyperlipidaemia were randomly assigned; 13 withdrew and 108 completed the study; men and women aged 50 to 60 years; TC > 219 mg/dL (5.66 mmol/L), TG < 400 mg/dL (4.52 mmol/L) on a low-fat diet 27 participants received placebo, 81 received atorvastatin Placebo baseline TC: 7.9 mmol/L (305 mg/dL) Placebo baseline LDL-C: 5.9 mmol/L (228 mg/dL) Placebo baseline HDL-C: 1.3 mmol/L (50 mg/dL) Placebo baseline TG: 1.5 mmol/L (133 mg/dL) Atorvastatin 5 mg/d baseline TC: 7.7 mmol/L (298 mg/dL) Atorvastatin 5 mg/d baseline LDL-C: 5.7 mmol/L (220 mg/dL) Atorvastatin 5 mg/d baseline HDL-C: 1.3 mmol/L (50 mg/dL) Atorvastatin 5 mg/d baseline TG: 1.6 mmol/L (142 mg/dL)

Atorvastatin for lowering lipids (Review)

J-CLAS 1997 (Continued)

Atorvastatin 10 mg/d baseline TC: 7.7 mmol/L (298 mg/dL)
 Atorvastatin 10 mg/d baseline LDL-C: 5.7 mmol/L (220 mg/dL)
 Atorvastatin 10 mg/d baseline HDL-C: 1.3 mmol/L (50 mg/dL)
 Atorvastatin 10 mg/d baseline TG: 1.4 mmol/L (124 mg/dL)

Atorvastatin 20 mg/d baseline TC: 8.2 mmol/L (317 mg/dL)
 Atorvastatin 20 mg/d baseline LDL-C: 6.2 mmol/L (240 mg/dL)
 Atorvastatin 20 mg/d baseline HDL-C: 1.3 mmol/L (50 mg/dL)
 Atorvastatin 20 mg/d baseline TG: 1.6 mmol/L (142 mg/dL)

Interventions	Placebo Atorvastatin 5 mg/d Atorvastatin 10 mg/d Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	WDAEs were reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind randomized treatment period"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured; WDAEs were reported
Other bias	Unclear risk	No source of funding was provided

Jin 2012

Methods	Participants were not receiving any lipid medications; therefore no wash-out period was required 3-Month before-and-after study
Participants	72 men and women with hyperlipidaemia; LDL-C \geq 4.14 mmol/L (160 mg/dL) Exclusion criteria: coronary artery disease, cardiac dysfunction, fever, peripheral vascular disease, liver or renal dysfunction, autoimmune disease, cancer, surgery or stroke within 6 months, history of infection, chronic inflammation, abnormal thyroid function, electrolyte imbalance, use of anti-inflammatory drugs excluding aspirin

Jin 2012 (Continued)

 Atorvastatin baseline TC: 6.37 mmol/L (246 mg/dL)
 Atorvastatin baseline LDL-C: 4.99 mmol/L (193 mg/dL)

Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change in serum TC and LDL-C from baseline at 12 weeks
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	High risk	HDL-C and triglycerides were not included in the efficacy analysis
Other bias	Low risk	Industry did not fund the trial

Joukhadar 2001

Methods	<p>Participants were not taking any hypolipidaemic drugs before the study; no wash-out run-in period was required</p> <p>3-Month double-blind randomised study</p>
Participants	<p>99 male and female participants from Austria enrolled in 3 groups, 33 per group, aged 52 to 55 years; BMI 24 to 25, TC 5.2 to 9.1 mmol/L, TG < 2.9 mmol/L</p> <p>Exclusion criteria: aged < 35 or > 75 years, BMI > 32, statin hypersensitivity, unstable coronary heart disease, diabetes mellitus, impaired hepatic or renal function, secondary hypercholesterolaemia, consumption of > 40 g ethanol per day, BP > 160/100 mmHg, anticoagulant, anti-inflammatory or antihypertensive drugs, thyroid disease, pregnancy or lactation, cancer, other abnormalities that threatened participant safety or completion of the trial</p> <p>Atorvastatin 10 mg/d baseline TC: 6.49 mmol/L (251 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.29 mmol/L (166 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.63 mmol/L (63 mg/dL) Atorvastatin 10 mg/d baseline TG: 1.25 mmol/L (111 mg/dL)</p>
Interventions	Atorvastatin 10 mg/d

Atorvastatin for lowering lipids (Review)

Joukhadar 2001 (Continued)

Simvastatin 40 mg/d

Pravastatin 40 mg/d

Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	4/33 (12.1%) were not included in the efficacy analysis because of problems with the assay
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	Source of funding was not reported

Kadikoylu 2003

Methods	<p>Participants were not taking lipid-lowering drugs within 8 weeks of the study; therefore no wash-out run-in period was required</p> <p>12-Week double-blind randomised prospective trial</p>
Participants	<p>61 men and women from Turkey, mean age 53 years (39 to 74); LDL-C > 130 mg/dL (3.36 mmol/L); all participants had at least 2 coronary risk factors</p> <p>35 received atorvastatin 10 mg/d, 26 received simvastatin 10 mg/d</p> <p>Exclusion criteria: pregnancy, lactation, cancer, CHD, type 1 or uncontrolled type 2 diabetes mellitus, TG > 500 mg/dL, BMI > 35, clotting disorders, elevated CK, liver enzyme levels at ULN, thrombocytopenia or thrombocytosis, hepatitis, chronic renal failure, alcohol abuse, secondary hypercholesterolaemia due to hypothyroidism, obstructive liver disease and nephrotic syndrome, statin hypersensitivity</p> <p>Baseline TC: 6.82 mmol/L (264 mg/dL) Baseline LDL-C: 4.36 mmol/L (169 mg/dL) Baseline HDL-C: 1.39 mmol/L (54 mg/dL) Baseline TG: 2.50 mmol/L (221 mg/dL)</p>

Atorvastatin for lowering lipids (Review)

Kadikoylu 2003 (Continued)

Interventions	Atorvastatin 10 mg/d for 0 to 12 weeks Atorvastatin 20 mg/d for 12 to 24 weeks in some patients Simvastatin 10 mg/d for 0 to 12 weeks Simvastatin 20 mg/d for 12 to 24 weeks in some patients
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not reported

Kadoglou 2011

Methods	Participants were not receiving lipid-altering substances within 12 weeks of the study; no wash-out was required 12-Week before-and-after study
Participants	52 men and women with hypercholesterolaemia; LDL-C \geq 130 mg/dL (3.36 mmol/L) Exclusion criteria: liver dysfunction, renal dysfunction, CAD, uncontrolled hormone or metabolic disease, diabetes, autoimmune disease, cancer, infection, use of anti-inflammatory drugs, weight loss Atorvastatin 20 mg/d baseline TC: 6.21 mmol/L (240 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.17 mmol/L (161 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.16 mmol/L (45 mg/dL) Atorvastatin 20 mg/d baseline TG: 2.04 mmol/L (181 mg/dL)
Interventions	Atorvastatin 20 mg/d

Atorvastatin for lowering lipids (Review)

Kadoglou 2011 (Continued)

Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	SDs were imputed	
Risk of bias		
Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	6% were not analysed
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Kajinami 2003

Methods	<p>≥ 8-Week wash-out period</p> <p>24-Week titration study</p>
Participants	<p>35 Japanese men and women with heterozygous FH; TC > 230 mg/dL (5.94 mmol/L)</p> <p>Exclusion criteria: acute illness, bone disease, chronic endocrine or renal disease, bone metabolism affecting drugs</p> <p>Baseline TC: 9.21 mmol/L (356 mg/dL) Baseline LDL-C: 7.19 mmol/L (278 mg/dL) Baseline HDL-C: 1.27 mmol/L (49 mg/dL) Baseline TG: 1.63 mmol/L (144 mg/dL)</p>
Interventions	<p>Atorvastatin 10 mg/d for 0 to 4 weeks</p> <p>Atorvastatin 20 mg/d for 4 to 12 weeks</p> <p>Atorvastatin 40 mg/d for 12 to 24 weeks</p>
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	<p>First atorvastatin dose was analysed</p> <p>SDs were imputed</p>

Atorvastatin for lowering lipids (Review)

Kim 2010 (Continued)

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	Chong Kun Dang Pharmacy Corporation funded the study

Kim 2013

Methods	4-Week wash-out period 8-Week before-and-after study
Participants	Eligible patients were men and women aged 20 to 79 years with documented primary hypercholesterolaemia; LDL-C > 100 mg/dL Exclusion criteria: therapy with other investigational drugs within 30 days of randomisation, statin hypersensitivity, uncontrolled hypertension, poorly controlled diabetes mellitus, unstable angina, new-onset MI, creatinine > 2.5 mg/dL, ALT > 2 × ULN, AST > 2 × ULN, CK 2 × ULN, history of malignancy or psychosis, chronic liver disease, drug or alcohol abuse, women who could become pregnant, HRT Atorvastatin 20 mg/d baseline TC: 5.875 mmol/L (227 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.03 mmol/L (156 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.24 mmol/L (48 mg/dL) Atorvastatin 20 mg/d baseline TG: 1.74 mmol/L (154 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	Dong-A Pharmaceutical Company Co, Ltd, sponsored the study

Kocic 2002

Methods	6-Week dietary wash-out baseline stabilisation period 8-Week before-and-after trial
Participants	20 eligible patients were men and women aged 50 to 75 years with primary hypercholesterolaemia; TC > 6.2 mmol/L, LDL-C > 4.2 mmol/L, TG < 4.5 mmol/L Exclusion criteria: pregnancy or breastfeeding, patients who had metabolic or endocrine disease that affected lipid levels Atorvastatin 10 mg/d baseline TC: 9.53 mmol/L (369 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 5.42 mmol/L (210 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.02 mmol/L (39 mg/dL) Atorvastatin 10 mg/d baseline TG: 2.87 mmol/L (254 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 8 weeks of plasma TC, LDL-C, HDL-C and TG
Notes	16 participants with NIDDM were not included in the analysis because lipid values did not add up according to the Friedewald equation

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not reported

Koh 2010

Methods	No participants took lipid-altering medications or supplements within 2 months of screening; no wash-out was required 8-Week single-blind randomised placebo-controlled trial
Participants	220 men and women with hypercholesterolaemia aged 54 to 58 years; LDL-C ≥ 100 mg/dL

Atorvastatin for lowering lipids (Review)

Koh 2010 (Continued)

Exclusion criteria: hepatic dysfunction, renal failure, hyperthyroidism, myopathy, uncontrolled diabetes, severe HTN, stroke, unstable angina, acute MI, coronary revascularisation within 3 months, alcohol abuse

Placebo baseline TC: 6.21 mmol/L (240 mg/dL)
 Placebo baseline LDL-C: 3.98 mmol/L (154 mg/dL)
 Placebo baseline HDL-C: 1.29 mmol/L (50 mg/dL)
 Placebo baseline TG: 1.94 mmol/L (172 mg/dL)

Atorvastatin 10 mg/d baseline TC: 6.15 mmol/L (238 mg/dL)
 Atorvastatin 10 mg/d baseline LDL-C: 4.03 mmol/L (156 mg/dL)
 Atorvastatin 10 mg/d baseline HDL-C: 1.32 mmol/L (51 mg/dL)
 Atorvastatin 10 mg/d baseline TG: 1.72 mmol/L (152 mg/dL)

Atorvastatin 20 mg/d baseline TC: 6.34 mmol/L (245 mg/dL)
 Atorvastatin 20 mg/d baseline LDL-C: 4.11 mmol/L (159 mg/dL)
 Atorvastatin 20 mg/d baseline HDL-C: 1.40 mmol/L (54 mg/dL)
 Atorvastatin 20 mg/d baseline TG: 1.77 mmol/L (157 mg/dL)

Atorvastatin 40 mg/d baseline TC: 6.26 mmol/L (242 mg/dL)
 Atorvastatin 40 mg/d baseline LDL-C: 4.01 mmol/L (155 mg/dL)
 Atorvastatin 40 mg/d baseline HDL-C: 1.32 mmol/L (51 mg/dL)
 Atorvastatin 40 mg/d baseline TG: 2.02 mmol/L (179 mg/dL)

Atorvastatin 80 mg/d baseline TC: 6.54 mmol/L (253 mg/dL)
 Atorvastatin 80 mg/d baseline LDL-C: 4.37 mmol/L (169 mg/dL)
 Atorvastatin 80 mg/d baseline HDL-C: 1.34 mmol/L (52 mg/dL)
 Atorvastatin 80 mg/d baseline TG: 1.85 mmol/L (164 mg/dL)

Interventions	Placebo Atorvastatin 10 mg/d Atorvastatin 20 mg/d Atorvastatin 40 mg/d Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG; WDAEs
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Insufficient information about the sequence generation process was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	High risk	Single-blind; investigators were not blinded
Blinding (performance bias and detection bias) All outcomes	High risk	Single-blind study
Incomplete outcome data (attrition bias) All outcomes	Low risk	7/220 (3.2%) were not analysed

Koh 2010 (Continued)

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured; WDAEs were reported
Other bias	Low risk	The study appears to be free of other sources of bias

Kom 2007

Methods	All participants were naive to statins or other lipid-lowering medications; therefore no wash-out run-in period was required 6-Week randomised placebo-controlled trial	
Participants	24 men and women from Germany with hypercholesterolaemia aged 35 to 60 years; LDL-C \geq 160 mg/dL 12 participants received placebo, 12 received atorvastatin 40 mg/d Exclusion criteria: alcohol and drug abuse, pregnancy or breastfeeding status, liver dysfunction, renal disease, nephrotic syndrome, diabetes mellitus <u>Placebo:</u> Baseline TC: 7.34 mmol/L (284 mg/dL) Baseline LDL-C: 5.22 mmol/L (202 mg/dL) Baseline HDL-C: 1.31 mmol/L (51 mg/dL) <u>Atorvastatin:</u> Baseline TC: 8.18 mmol/L (316 mg/dL) Baseline LDL-C: 5.97 mmol/L (231 mg/dL) Baseline HDL-C: 1.53 mmol/L (59 mg/dL)	
Interventions	Placebo Atorvastatin 40 mg/d	
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C and HDL-C	
Notes	SDs were imputed No WDAE data were recorded	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Unclear risk	No information about blinding was provided to permit judgement of 'yes' or 'no' "Randomized to atorvastatin 40 mg or placebo for 6 weeks"
Incomplete outcome data (attrition bias)	High risk	Data on all participants were reported

Atorvastatin for lowering lipids (Review)

Kom 2007 (Continued)

All outcomes

Selective reporting (reporting bias)	High risk	TG data were not reported; no withdrawals due to adverse events were reported
Other bias	Unclear risk	The source of funding was not reported

Kosmidou 2008

Methods	6-Week dietary lead-in 12-Week before-and-after study
Participants	97 men and women with hyperlipidaemia with and without HTN; LDL-C > 160 mg/dL (4.14 mmol/L), TG < 250 mg/dL (2.82 mmol/L) 60 participants received atorvastatin, 37 received no medication Exclusion criteria: renal dysfunction, liver disease, TSH > 5 mU/L, diabetes mellitus, childbearing potential, use of lipid-altering drugs, antihypertensive therapy Atorvastatin baseline TC: 7.3 mmol/L (282 mg/dL) Atorvastatin baseline LDL-C: 5.1 mmol/L (197 mg/dL) Atorvastatin baseline HDL-C: 1.3 mmol/L (50 mg/dL) Atorvastatin baseline TG: 1.9 mmol/L (168 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Kural 2004

Methods	No participants had been receiving lipid-lowering drug treatment; therefore no wash-out period was required 6-Week to 12-week before-and-after trial	
Participants	40 men and women from Turkey with dyslipidaemia aged 53 years (41-65) Exclusion criteria: hypothyroidism, diabetes mellitus, nephrotic syndrome, renal insufficiency, hepatic dysfunction, cancer, immune disorder, uncontrolled HTN, smoking, CAD Baseline TC: 7.45 mmol/L (288 mg/dL) Baseline LDL-C: 5.28 mmol/L (204 mg/dL) Baseline HDL-C: 1.06 mmol/L (41 mg/dL) Baseline TG: 2.27 mmol/L (201 mg/dL)	
Interventions	Atorvastatin 40 mg/d	
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Kural 2004 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Labios 2005

Methods	6-Week wash-out period 2-Month before-and-after study
Participants	33 men and women with primary hypercholesterolaemia with or without mixed hyperlipidaemia, aged 55 years Exclusion criteria: organic underlying disease, cancer, infectious or inflammatory disorder, use of antiplatelet drugs, diabetes, SBP > 140 mmHg, DBP > 90 mmHg, obesity, pregnancy, other additional lipid-lowering treatment Baseline TC: 6.85 mmol/L (265 mg/dL) Baseline LDL-C: 4.53 mmol/L (175 mg/dL) Baseline HDL-C: 1.50 mmol/L (58 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 2 months of serum TC, LDL-C and HDL-C
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Atorvastatin for lowering lipids (Review)

Labios 2005 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin

Lavallee 2009

Methods	<p>Statin or fibrate treatment had to be stopped \geq 50 days before the study</p> <p>12-Week double-blind randomised placebo-controlled trial</p>
Participants	<p>117 men and women with lacunar stroke within the previous 3 months aged \geq 18 years</p> <p>Exclusion criteria: arterial stenosis \geq 50% in the stroke territory, childbearing potential, unstable angina, severe respiratory insufficiency, no temporal bone window</p> <p>Placebo baseline TC: 5.7 mmol/L (220 mg/dL) Placebo baseline LDL-C: 3.6 mmol/L (139 mg/dL) Placebo baseline HDL-C: 1.4 mmol/L (54 mg/dL)</p> <p>Atorvastatin 80 mg/d baseline TC: 5.8 mmol/L (224 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 3.6 mmol/L (139 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.5 mmol/L (58 mg/dL)</p>
Interventions	<p>Placebo</p> <p>Atorvastatin 80 mg/d</p>
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C and HDL-C; WDAEs
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Insufficient information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	Insufficient information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	Low risk	33.2% were not analysed
Selective reporting (reporting bias)	High risk	TG data were not analysed

Atorvastatin for lowering lipids (Review)

Lavallee 2009 (Continued)

Other bias	High risk	Pfizer funded the trial
------------	-----------	-------------------------

Lawrence 2004

Methods	6-Week baseline dietary stabilisation period 8-Week randomised double-blind placebo-controlled study
Participants	44 obese men and women with NIDDM from the UK aged 45 to 80 years; TC > 5 mmol/L (193 mg/dL); 40 completed the study 20 participants received placebo, 20 received atorvastatin Exclusion criteria: statin hypersensitivity, taking insulin or a thiazolidinedione, lipid-lowering therapy within 4 months of the study; women of childbearing age were not excluded if sterilised or using adequate contraception Placebo baseline TC: 5.87 mmol/L (227 mg/dL) Placebo baseline LDL-C: 6.20 mmol/L (240 mg/dL) Placebo baseline HDL-C: 1.24 mmol/L (48 mg/dL) Placebo baseline TG: 2.05 mmol/L (182 mg/dL) Atorvastatin baseline TC: 5.64 mmol/L (218 mg/dL) Atorvastatin baseline LDL-C: 5.74 mmol/L (222 mg/dL) Atorvastatin baseline HDL-C: 1.30 mmol/L (50 mg/dL) Atorvastatin baseline TG: 1.93 mmol/L (171 mg/dL)
Interventions	Placebo Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed WDAEs were reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"A double-blind, randomized, placebo-controlled design"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Placebo: 2/22 were not included in the efficacy analysis because they did not complete the study Atorvastatin: 2/22 were not included in the efficacy analysis because they did not complete the study 9.1% of participants were excluded from the efficacy analysis

Lawrence 2004 (Continued)

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured; WDAEs were reported
Other bias	High risk	Pfizer Pharmaceuticals funded the study; data may support bias for atorvastatin

LCP-AtorFen 2009

Methods	4-Week to 8-week wash-out period 12-Week multi-centre randomised double-blind study
Participants	220 men and women \geq 18 years with mixed lipidaemia; TG 150 to 500 mg/dL 145 participants received fenofibrate, 73 received fenofibrate-atorvastatin combination, 74 received atorvastatin Exclusion criteria: women who were pregnant or could become pregnant, poorly controlled type 2 diabetes mellitus, type 1 diabetes mellitus, lipoprotein lipase impairment or deficiency, apo CII deficiency, familial dysbetalipoproteinaemia, history of pancreatitis, CPK $>$ $2 \times$ ULN, ALT or AST $>$ $1.5 \times$ ULN, muscle pain, myopathy or rhabdomyolysis, poorly controlled HTN, unstable CHD, TIAs, stroke, aortic aneurysm, revascularisation or resection 6 months previously; renal, pulmonary, hepatic, biliary or gastrointestinal disease; statin or fibrate allergy, food supplements that can alter serum lipids Atorvastatin baseline TC: 6.58 mmol/L (2548 mg/dL) Atorvastatin baseline LDL-C: 4.27 mmol/L (165 mg/dL) Atorvastatin baseline HDL-C: 1.10 mmol/L (42.5 mg/dL) Atorvastatin baseline TG: 2.99 mmol/L (2651 mg/dL)
Interventions	Atorvastatin 40 mg/d Atorvastatin/fenofibrate 40/100 mg/d Fenofibrate 145 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum LDL-C, HDL-C and TG
Notes	Atorvastatin monotherapy group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d monotherapy group; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d monotherapy group; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d monotherapy group; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias)	Low risk	Of 74 participants randomly assigned to atorvastatin, 70 were analysed for efficacy

Atorvastatin for lowering lipids (Review)

LCP-AtorFen 2009 (Continued)

All outcomes

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	The study was sponsored by LifeCycle Pharma, which supplies atorvastatin fenofibrate combination, so there may be bias against atorvastatin

Lee 2007

Methods	4-Week dietary lead-in period 8-Week randomised open-label multi-centre study
Participants	268 men and women aged 20 to 79 years with untreated hypercholesterolaemia; TG < 400 mg/dL (4.52 mmol/L), LDL-C > 130 mg/dL (3.36 mmol/L), 222 participants completed the study 112 participants received atorvastatin, 110 received pitavastatin Exclusion criteria: pregnant and breastfeeding women, current use of lipid-altering therapy, uncontrolled diabetes mellitus, uncontrolled HTN, history of cerebrovascular disease or MI within 3 months of enrolment, congestive heart failure, serum creatinine > 2.0 mg/dL, hepatic dysfunction, CK > 2.5 × ULN Atorvastatin baseline TC: 6.18 mmol/L (239 mg/dL) Atorvastatin baseline LDL-C: 4.14 mmol/L (160 mg/dL) Atorvastatin baseline HDL-C: 1.34 mmol/L (52 mg/dL) Atorvastatin baseline TG: 1.54 mmol/L (136 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 4 weeks Atorvastatin conditional titration of 20 mg/d for 4 to 8 weeks Pitavastatin 2 mg/d for 0 to 4 weeks Pitavastatin conditional titration of 4 mg/d for 4 to 8 weeks
Outcomes	Per cent change from baseline at 4 weeks for serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Lee 2007 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Choongwae Pharma Corp funded the study; data may support bias against atorvastatin

Lee 2011

Methods	4-Week dietary wash-out period 8-Week before-and-after trial
Participants	Men and women aged 20 to 79 years; LDL-C > 130 mg/dL, TG < 400 mg/dL Exclusion criteria: FH, pregnancy or breastfeeding, stroke history or MI within 3 months of study, renal dysfunction, thyroid dysfunction, inflammatory disease, anti-inflammatory drug use, cancer, history of adverse reaction to test drugs Atorvastatin 20 mg/d baseline TC: 6.18 mmol/L (239 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.24 mmol/L (164 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.31 mmol/L (51 mg/dL) Atorvastatin 20 mg/d baseline TG: 1.45 mmol/L (128 mg/dL)
Interventions	Atorvastatin 20 mg/d Atorvastatin/ezetimibe 5 mg/5 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis

Lee 2013 (Continued)

Other bias	Unclear risk	Grant from MSD Inc was provided for funding
------------	--------------	---

Lemieux 2003

Methods	4-Week wash-out period 12-Week multi-centre randomised study	
Participants	136 dyslipidaemic individuals from Canada aged 18 to 75 years; LDL-C > 3.24 mmol/L (125.3 mg/dL), HDL-C < 1.10 mmol/L (42.5 mg/dL) in men, HDL-C < 1.20 mmol/L (46.4 mg/dL) in women, TG < 4.52 mmol/L (400.7 mg/dL) 72 participants received atorvastatin, 64 received fenofibrate Exclusion criteria: diabetes mellitus, digestive disease, PTCA or CABG within 6 months, unstable angina, alcoholism Atorvastatin baseline TC: 6.03 mmol/L (233 mg/dL) Atorvastatin baseline LDL-C: 4.10 mmol/L (159 mg/dL) Atorvastatin baseline HDL-C: 0.94 mmol/L (36 mg/dL) Atorvastatin baseline TG: 2.18 mmol/L (193 mg/dL)	
Interventions	Atorvastatin 10 mg/d for 0 to 12 weeks Fenofibrate 200 mg/d for 0 to 12 weeks	
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	Atorvastatin group was analysed SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Leung 2002

Methods	6-Week wash-out period 18-Week open-label multi-centre study
Participants	63 men and women from Hong Kong, mean age 64 years (44-78) with CAD and hypercholesterolaemia; LDL 3.4 to 5.2 mmol/L (131-201 mg/dL), TG ≤ 4.5 mmol/L (399 mg/dL) Exclusion criteria: < 18 or > 80 years, women likely to become pregnant, heavy drinking, secondary hypercholesterolaemia, uncontrolled HTN and type 2 diabetes, BMI > 30, liver and renal dysfunction or history of CAD that required intervention Baseline TC: 5.90 mmol/L (228 mg/dL) Baseline LDL-C: 4.04 mmol/L (156 mg/dL) Baseline HDL-C: 1.20 mmol/L (46.4 mg/dL) Baseline TG: 1.60 mmol/L (142 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 6 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Li 2010

Methods	Participants were not receiving lipid-altering agents, so no wash-out was required 12-Week before-and-after trial
Participants	84 men and women with CHD aged 55 to 76 years Exclusion criteria: liver or renal failure, diabetes mellitus, MI, HTN, severe or unstable angina pectoris, heart failure, severe cardiac arrhythmia, transplantation

Atorvastatin for lowering lipids (Review)

Li 2010 (Continued)

Atorvastatin 10 mg/d baseline TC: 5.43 mmol/L (210 mg/dL)
 Atorvastatin 10 mg/d baseline LDL-C: 3.31 mmol/L (128 mg/dL)
 Atorvastatin 10 mg/d baseline HDL-C: 1.13 mmol/L (44 mg/dL)
 Atorvastatin 10 mg/d baseline TG: 1.68 mmol/L (149 mg/dL)

Interventions	Atorvastatin 10 mg/d Simvastatin 20 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Lins 2004

Methods	4-Week wash-out period 12-Week multi-centre randomised double-blind placebo-controlled parallel-group study Block randomisation with block size 4 Morning doses
Participants	42 men and women from Belgium with chronic renal failure > 17 years, TC > 210 mg/dL (5.4 mmol/L), TG > 500 mg/dL (5.6 mmol/L) 23 participants received atorvastatin, 19 received placebo Exclusion criteria: pregnant and breastfeeding women, uncontrolled diabetes, hepatic dysfunction Placebo baseline TC: 6.08 mmol/L (235 mg/dL) Placebo baseline LDL-C: 3.54 mmol/L (137 mg/dL) Placebo baseline HDL-C: 1.14 mmol/L (44 mg/dL) Placebo baseline TG: 2.26 mmol/L (200 mg/dL) Atorvastatin baseline TC: 6.28 mmol/L (243 mg/dL)

Atorvastatin for lowering lipids (Review)

Lins 2004 (Continued)

Atorvastatin baseline LDL-C: 3.39 mmol/L (131 mg/dL)
 Atorvastatin baseline HDL-C: 1.16 mmol/L (45 mg/dL)
 Atorvastatin baseline TG: 2.22 mmol/L (197 mg/dL)

Interventions	Placebo Atorvastatin 10 mg/d for 0 to 4 weeks Atorvastatin 20 mg/d for 4 to 8 weeks Atorvastatin 40 mg/d for 8 to 12 weeks
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	The placebo group and the first atorvastatin dose group were analysed WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"The study had a randomized, double-blind, placebo-controlled, parallel-group design"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin

Llaverias 2008

Methods	4-Week wash-out period 4-Week study
Participants	12 men with type IIb FH; all individuals fulfilled the standard criteria of untreated serum cholesterol or TG levels above the sex- and age-adjusted 90th percentile for the reference population Exclusion criteria: secondary causes of hyperlipidaemia, tendon xanthoma, diagnosis matching FH Baseline TC: 8.74 mmol/L (338 mg/dL) Baseline LDL-C: 6.05 mmol/L (234 mg/dL) Baseline HDL-C: 1.22 mmol/L (47.2 mg/dL)
Interventions	Atorvastatin 40 mg/d

Atorvastatin for lowering lipids (Review)

Llaverias 2008 (Continued)

Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C and HDL-C
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	High risk	TG data were not reported because data were expressed as median values
Other bias	Low risk	The study appears to be free of other sources of bias

Loughrey 2013

Methods	<p>Participants were not receiving any lipid medications; therefore no wash-out period was required</p> <p>6-Week randomized double-blind placebo-controlled trial</p>
Participants	<p>50 men and women with metabolic syndrome aged 35-63 years with metabolic syndrome as defined by the International Diabetes Federation; central obesity plus 2 of the following:</p> <p>hypertension, glucose intolerance, low HDL-C hypertriglyceridaemia</p> <p>24 participants received atorvastatin; 26 received placebo</p> <p>Exclusion criteria: preexisting indication for lipid-lowering therapy, history of intolerance for these agents, insulin use or HRT, liver or muscle disease, renal dysfunction, potential for pregnancy, total cholesterol > 6.5 mmol/L (251 mg/dL) or < 4 mmol/L (155 mg/dL)</p> <p>Atorvastatin baseline TC: 5.64 mmol/L (218 mg/dL) Atorvastatin baseline LDL-C: 3.37 mmol/L (130 mg/dL) Atorvastatin baseline HDL-C: 1.26 mmol/L (49 mg/dL) Atorvastatin baseline TG: 2.02 mmol/L (179 mg/dL)</p> <p>Placebo baseline TC: 5.52 mmol/L (213 mg/dL) Placebo baseline LDL-C: 3.21 mmol/L (124 mg/dL) Placebo baseline HDL-C: 1.43 mmol/L (55 mg/dL) Placebo baseline TG: 2.02 mmol/L (179 mg/dL)</p>
Interventions	Atorvastatin 10 mg/d

Atorvastatin for lowering lipids (Review)

Loughrey 2013 (Continued)

Placebo

Outcomes Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG

Notes SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	Unclear risk	The source of funding was not reported

LUNAR 2012

Methods	<p>Participants were not receiving lipid-lowering medications within 4 weeks of the trial; no wash-out period was required</p> <p>12-Week randomised open-label parallel-group study</p>
Participants	<p>825 men and women with acute coronary syndrome and coronary artery disease 18 to 75 years old; LDL-C > 70 mg/dL (1.81 mmol/L) and TG < 500 mg/dL (5.645 mmol/L)</p> <p>278 participants received atorvastatin, 547 received rosuvastatin</p> <p>Exclusion criteria: hormone therapy within the previous 3 months, Q-wave MI, pulmonary oedema, moderate or severe heart failure, acute moderate to severe mitral regurgitation, acute ventricular septal defect, ventricular fibrillation or tachycardia, complete heart block, new-onset atrial fibrillation with uncontrolled ventricular rate, paced ventricular rhythm, stroke, sepsis, acute pericarditis, systemic or pulmonary embolus within preceding 4 weeks, bypass within 3 months, PCI within 6 months, statin hypersensitivity, pregnancy or breastfeeding, uncontrolled diabetes mellitus, hypertension, hypothyroidism, systolic hypotension, hepatic dysfunction, severe anaemia, serum creatine kinase 3 × ULN not caused by myocardial injury</p> <p>Atorvastatin 80 mg/d baseline TC: 5.066 mmol/L (196 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 3.445 mmol/L (133 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.03 mmol/L (40 mg/dL) Atorvastatin 80 mg/d baseline TG: 1.78 mmol/L (157 mg/dL)</p>
Interventions	<p>Atorvastatin 80 mg/d</p> <p>Rosuvastatin 20 mg/d</p>

Atorvastatin for lowering lipids (Review)

LUNAR 2012 (Continued)

Rosuvastatin 40 mg/d

Outcomes	Per cent change from baseline at 6 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin treatment was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 80 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 80 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	21/278 (7.6%) participants were not included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	High risk	AstraZeneca funded the trial; efficacy could be biased against atorvastatin

Lupattelli 2012

Methods	Participants were not receiving any lipid medications; therefore no wash-out period was required 8-Week before-and-after trial
Participants	80 men and women with polygenic hypercholesterolaemia or familial combined hyperlipaemia type IIB; individuals with polygenic hypercholesterolaemia had LDL-C of 160 to 199 mg/dL (4.14-5.15 mmol/L) Exclusion criteria: secondary hyperlipaemia, autosomal dominant hypercholesterolaemia, familial hypertriglyceridaemia Atorvastatin 10 mg/d baseline LDL-C: 5.13 mmol/L (198 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.125 mmol/L (43.5 mg/dL) Atorvastatin 10 mg/d baseline TG: 1.97 mmol/L (174 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias
Atorvastatin for lowering lipids (Review)

Lupattelli 2012 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	High risk	Total cholesterol was not included in the efficacy analysis
Other bias	Unclear risk	The source of funding was not reported

Ma 2000

Methods	10-Week wash-out period 8-Week multi-centre double-blind randomised study Randomly assigned in a 2:2:1:1 ratio Evening doses
Participants	340 men and women from Canada with combined type IIb dyslipidaemia, mean age 56.6 years (18-80); TG 2.8 to 9.0 mmol/L (248-797 mg/dL), LDL-C 2.6 to 3.4 mmol/L (100-131 mg/dL) Exclusion criteria: women who are likely to become pregnant, unstable weight, type 1 diabetes or uncontrolled type 2 diabetes, severe HTN, MI, unstable CVD, hypothyroidism, cancer, renal and hepatic dysfunction, neuromuscular disease, gastrointestinal disease, pancreatitis, drugs affecting lipid analysis or values, alcohol and drug abuse, immunosuppressants Atorvastatin 10 mg/d baseline TC: 6.80 mmol/L (263 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.21 mmol/L (163 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.01 mmol/L (39 mg/dL) Atorvastatin 10 mg/d baseline TG: 3.67 mmol/L (325 mg/dL) Atorvastatin 20 mg/d baseline TC: 7.20 mmol/L (278 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.57 mmol/L (1773 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.06 mmol/L (41 mg/dL) Atorvastatin 20 mg/d baseline TG: 3.75 mmol/L (315 mg/dL)
Interventions	Atorvastatin 10 mg/d Atorvastatin 20 mg/d Cerivastatin 0.4 mg/d Cerivastatin 0.8 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C and HDL-C

Atorvastatin for lowering lipids (Review)

Ma 2000 (Continued)

Notes Atorvastatin groups were analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin 10 mg/d: 1/112 were not included in the efficacy analysis because of absence of post-randomisation lipid data Atorvastatin 20 mg/d: 1/56 were not included in the efficacy analysis because of absence of post-randomisation lipid data 1.2% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	High risk	TG data reported were excluded from this review because they were expressed as median per cent change
Other bias	High risk	The trial was supported by Bayer Canada Inc; data may support bias against atorvastatin

Mabuchi 2005

Methods	4-Week dietary lead-in period 8-Week study
Participants	14 men and women from Japan with hypercholesterolaemia; TC > 220 mg/dL (5.69 mmol/L) Exclusion criteria: pregnant or lactating women, women of childbearing potential Baseline TC: 7.09 mmol/L (274 mg/dL) Baseline LDL-C: 4.97 mmol/L (192 mg/dL) Baseline HDL-C: 1.40 mmol/L (54 mg/dL) Baseline TG: 1.57 mmol/L (139 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Mabuchi 2005 (Continued)

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Mabuchi 2007

Methods	4-Week dietary lead-in period 16-Week randomised double-blind placebo-controlled study to examine the effects of CoQ10 and placebo in hypercholesterolaemic patients treated with atorvastatin
Participants	49 men and women with hypercholesterolaemia 25 participants received placebo CoQ10 + atorvastatin, 24 received CoQ10 + atorvastatin Exclusion criteria: pregnancy or lactation, FH, taking other lipid-altering medications including antioxidants Placebo CoQ10 + atorvastatin 10 mg/d baseline TC: 7.33 mmol/L (283 mg/dL) Placebo CoQ10 + atorvastatin 10 mg/d baseline LDL-C: 4.84 mmol/L (187 mg/dL) Placebo CoQ10 + atorvastatin 10 mg/d baseline HDL-C: 1.56 mmol/L (60 mg/dL) Placebo CoQ10 + atorvastatin 10 mg/d baseline TG: 1.85 mmol/L (164 mg/dL) CoQ10 + atorvastatin 10 mg/d baseline TC: 7.15 mmol/L (276 mg/dL) CoQ10 + atorvastatin 10 mg/d baseline LDL-C: 4.73 mmol/L (183 mg/dL) CoQ10 + atorvastatin 10 mg/d baseline HDL-C: 1.61 mmol/L (62 mg/dL) CoQ10 + atorvastatin 10 mg/d baseline TG: 1.39 mmol/L (123 mg/dL)
Interventions	Atorvastatin 10 mg/d + placebo CoQ10 Atorvastatin 10 mg/d + CoQ10 10 mg/d
Outcomes	Per cent change from baseline at 4 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
------	--------------------	-----------------------

Mabuchi 2007 (Continued)

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d + placebo and atorvastatin 10 mg/d + CoQ10 interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d + placebo and atorvastatin 10 mg/d + CoQ10 interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d + placebo and atorvastatin 10 mg/d + CoQ10 interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The study was supported by Kaneka Co Osaka; Kaneka sells CoQ10

Macin 2005

Methods	No participant received a statin or other lipid-lowering agents at any time during the preceding 1 month; therefore no wash-out period was required 1-Month prospective randomised double-blind placebo-controlled trial	
Participants	90 men and women with ACS from Argentina aged > 21 years Exclusion criteria: active liver disease, untreated endocrine disorder, systemic inflammatory disease or cancer, statin hypersensitivity, threat of poor compliance, known infectious disease within 30 days of study, lack of consent, cardiogenic shock, acute pulmonary oedema <u>Placebo:</u> Baseline TC: 5.02 mmol/L (194 mg/dL) Baseline LDL-C: 3.09 mmol/L (119 mg/dL) Baseline HDL-C: 0.96 mmol/L (37 mg/dL) Baseline TG: 2.08 mmol/L (184 mg/dL) <u>Atorvastatin:</u> Baseline TC: 5.02 mmol/L (194 mg/dL) Baseline LDL-C: 3.30 mmol/L (128 mg/dL) Baseline HDL-C: 0.95 mmol/L (37 mg/dL) Baseline TG: 2.19 mmol/L (194 mg/dL)	
Interventions	46 participants received placebo, 44 received atorvastatin 40 mg/d	
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG; WDAEs were reported as deaths	
Notes	SDs were imputed	

Risk of bias
Atorvastatin for lowering lipids (Review)

Macin 2005 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind fashion"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	All lipid parameters were measured WDAEs were not reported for placebo and atorvastatin groups
Other bias	Unclear risk	The source of funding was not reported

Magen 2004

Methods	4-Week run-in phase 8-Week single-blind randomised placebo-controlled trial
Participants	31 men and women with hyperlipidaemia and essential HTN, LDL-C > 130 mg/dL (3.36 mmol/L) Exclusion criteria: diabetes mellitus treated with medication, fasting hyperglycaemia > 150 mg/dL, liver or kidney disease, cancer, acute MI or unstable angina within 6 months, heart failure, smoking > 10 cigarettes/d, use of corticosteroids or other immunosuppressive therapy, abnormal levels of plasma aldosterone, supine and standing plasma renin activity and 24-hour urinary catecholamines, renal artery stenosis Placebo baseline LDL-C: 3.84 mmol/L (148 mg/dL) Atorvastatin baseline LDL-C: 4.20 mmol/L (162 mg/dL)
Interventions	Placebo Atorvastatin 20 mg/d Ascorbic acid 500 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum LDL-C
Notes	Placebo and atorvastatin groups were analysed SDs were imputed WDAEs were not reported

Risk of bias

Atorvastatin for lowering lipids (Review)

Magen 2004 (Continued)

Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	High risk	Single-blind; investigators were not blinded
Blinding (performance bias and detection bias) All outcomes	High risk	"Randomized in a single-blind manner"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TC, HDL-C and TG data were not reported; WDAEs were not reported
Other bias	Unclear risk	No source of funding was provided

Majima 2007

Methods	Participants had untreated hypercholesterolaemia; therefore no wash-out period was required 3-Month (at baseline and 3 months after the start of treatment) longitudinal trial	
Participants	22 men from Japan with hypercholesterolaemia aged 62 years; TC > 220 mg/dL, LDL-C > 140 mg/dL, BMI 24.6 Exclusion criteria: history of fracture, type 1 diabetes mellitus, liver disease, renal dysfunction, cancer, hyperthyroidism, hyperparathyroidism, hypogonadism, drugs that affect bone metabolism, TG > 500 mg/dL Baseline TC: 6.41 mmol/L (248 mg/dL) Baseline LDL-C: 4.21 mmol/L (163 mg/dL) Baseline HDL-C: 1.33 mmol/L (51 mg/dL) Baseline TG: 1.87 mmol/L (166 mg/dL)	
Interventions	Atorvastatin 10 mg/d	
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Majima 2007 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not reported

Maki 2011

Methods	4-Week diet lead-in wash-out period 16-Week before-and-after study	
Participants	245 men and women with mixed dyslipidaemia aged 18 to 79 years; non-HDL-C > 160 mg/dL (4.14 mmol/L) TG ≥ 250 mg/dL (2.82 mmol/L) and < 600 mg/dL (6.77 mmol/L) 123 participants received atorvastatin and POM3, 122 received atorvastatin Exclusion criteria: history of cardiovascular events, significant renal or pulmonary disease, cancer, uncontrolled hypertension, myopathy, lipoprotein lipase dysfunction, Apo CII deficiency, familial dysbetalipoproteinaemia, BMI > 40, glycosylated haemoglobin > 9%, elevated serum transaminase, creatinine or creatine kinase, drug or alcohol abuse Atorvastatin 10 mg/d baseline LDL-C: 5.03 mmol/L (195 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 0.835 mmol/L (32 mg/dL)	
Interventions	Atorvastatin 10 mg/d for 8 weeks + placebo POM3 Atorvastatin 20 mg/d for 8 to 12 weeks + placebo POM3 Atorvastatin 40 mg/d for 12 to 16 weeks + placebo POM3 Atorvastatin 10 mg/d for 8 weeks + POM3 Atorvastatin 20 mg/d for 8 to 12 weeks + POM3 Atorvastatin 40 mg/d for 12 to 16 weeks + POM3	
Outcomes	Per cent change from baseline at 8 weeks of serum LDL-C and HDL-C	
Notes	Atorvastatin 10 mg/d for 8 weeks + placebo POM3; treatment arm was analysed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Maki 2011 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	1/122 (0.8%) participants were not included in the efficacy analysis
Selective reporting (reporting bias)	High risk	Total cholesterol and triglycerides were not included in the efficacy analysis

Mandosi 2010

Methods	Participants were not receiving lipid-altering agents, so no wash-out was required 8-Week before-and-after trial	
Participants	22 men and women with type 2 diabetes mellitus aged 54 to 68 years Exclusion criteria: anti-inflammatory use, smoking, cancer, major surgery or MI within 6 months of trial, infection, inflammatory disease, renal and hepatic dysfunction, severe retinopathy, pregnancy Atorvastatin 20 mg/d baseline TC: 5.2 mmol/L (201 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 3.2 mmol/L (124 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.0 mmol/L (29 mg/dL)	
Interventions	Atorvastatin 20 mg/d	
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C and HDL-C	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis

Mandosi 2010 (Continued)

Selective reporting (reporting bias)	High risk	TG data were not analysed
Other bias	Unclear risk	The source of funding was not revealed

Manuel-Y-Keenoy 2004

Methods	4-Week to 6-week wash-out period 6-Month randomised block atorvastatin study
Participants	24 individuals with type 1 diabetes; TC > 4.9 mmol/L, LDL-C > 3.0 mmol/L, TG < 4.5 mmol/L Baseline TC: 6.08 mmol/L (235 mg/dL) Baseline LDL-C: 3.91 mmol/L (151 mg/dL) Baseline TG: 1.17 mmol/L (104 mg/dL)
Interventions	Atorvastatin 20 mg/d + vitamin E 250 IU Atorvastatin 20 mg/d + vitamin E placebo
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C and TG
Notes	Data for both interventions were combined SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d + placebo and atorvastatin 20 mg/d + vitamin E; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d + placebo and atorvastatin 20 mg/d + vitamin E; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d + placebo and atorvastatin 20 mg/d + vitamin E; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	2/24 were not included in the efficacy analysis because they did not complete the study 8.3% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	High risk	HDL-C data were not reported
Other bias	Unclear risk	Omega-Pharma NV supplied the alpha tocopherol and placebo. No source of funding was provided

Marais 1997

Methods	4-Week wash-out period 6-Week open-label randomised study
Participants	22 ambulatory men and women from South Africa with FH recruited from lipid clinics aged 38 years (21-58); TG < 4.5 mmol/L (399 mg/dL) Exclusion criteria: consumption of lipid-modifying drugs; significant liver, renal or endocrine disease; alcohol consumption, uncontrolled HTN, conception risk, BMI > 32 Baseline TC: 9.90 mmol/L (383 mg/dL) Baseline LDL-C: 8.16 mmol/L (316 mg/dL) Baseline HDL-C: 1.19 mmol/L (46.02 mg/dL) Baseline TG: 1.34 mmol/L (119 mg/dL)
Interventions	Atorvastatin 40 mg/d BID Atorvastatin 80 mg/d in the evening
Outcomes	Per cent change from baseline at 4 to 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Data for both interventions were combined SDs were imputed for TC, HDL-C and TG

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Marchesi 2000

Methods	No participant was receiving lipid-lowering drugs; therefore no wash-out period was required 8-Week before-and-after trial
Participants	30 postmenopausal women with hypercholesterolaemia, mean age 58 years; BP 131/75 mmHg, BMI 23.8

Atorvastatin for lowering lipids (Review)

Marchesi 2000 (Continued)

Exclusion criteria: none reported

Baseline TC: 8.25 mmol/L (319 mg/dL)

Baseline LDL-C: 5.90 mmol/L (228 mg/dL)

Baseline HDL-C: 1.53 mmol/L (59 mg/dL)

Baseline TG: 1.78 mmol/L (158 mg/dL)

Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Marketou 2006

Methods	6-Week wash-out period 3-Week open-label parallel-group randomised design
Participants	43 men and women from Greece aged 35 to 70 years; LDL-C > 190 mg/dL Exclusion criteria: current or previous statin treatment, ACS history, revascularisation procedures, coronary or peripheral arterial disease symptoms, uncontrolled diabetes mellitus or HTN, left ventricular ejection fraction < 60%, liver disease, renal insufficiency, drug or alcohol abuse history, any inflammatory or other chronic infectious disease, pregnancy threat, uncontrolled hypothyroidism, immunosuppressant use Atorvastatin baseline TC: 7.21 mmol/L (279 mg/dL) Atorvastatin baseline LDL-C: 4.60 mmol/L (178 mg/dL) Atorvastatin baseline HDL-C: 1.03 mmol/L (40 mg/dL) Atorvastatin baseline TG: 2.56 mmol/L (227 mg/dL)
Interventions	Atorvastatin 40 mg/d

Marketou 2006 (Continued)

Simvastatin 40 mg/d

Outcomes Per cent change from baseline at 3 weeks of serum TC, LDL-C, HDL-C and TG

 Notes Atorvastatin group was analysed
 Results of the placebo group were not reported
 SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	Unclear risk	No source of funding was provided

McInnes 2014

 Methods 3-Month baseline wash-out period for all lipid-altering agents
 6-Week randomised double-blind placebo-controlled trial

 Participants 98 men and women 18 years of age or older with rheumatoid arthritis
 Exclusion criteria: haemoglobin < 9.0 g/dL, haematocrit < 30%, white blood cell count < $3.0 \times 10^9/L$, absolute neutrophil count < $1.2 \times 10^9/L$ or platelet count < $100 \times 10^9/L$, estimated glomerular filtration rate ≤ 40 mL/min, AST or ALT > $1.5 \times$ ULN, TG > 4.52 mmol/L (400 mg/dL) and TC > 8.29 mmol/L (321 mg/dL), cancer, herpes zoster, hepatitis B or C or HIV, evidence of TB within 3 months of screening
 50 participants received atorvastatin, 48 received placebo
 Placebo baseline TC: 6.07 mmol/L (235 mg/dL)
 Placebo baseline LDL-C: 3.58 mmol/L (138 mg/dL)
 Placebo baseline HDL-C: 1.83 mmol/L (71 mg/dL)
 Placebo baseline TG: 1.46 mmol/L (129 mg/dL)
 Atorvastatin 10 mg/d baseline TC: 5.91 mmol/L (229 mg/dL)
 Atorvastatin 10 mg/d baseline LDL-C: 3.52 mmol/L (136 mg/dL)
 Atorvastatin 10 mg/d baseline HDL-C: 1.75 mmol/L (68 mg/dL)

Atorvastatin for lowering lipids (Review)

McInnes 2014 (Continued)

Atorvastatin 10 mg/d baseline TG: 1.28 mmol/L (113 mg/dL)

Interventions	Placebo Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 to 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Fixed randomisation was accomplished using IVRS (an automated web/telephone randomisation system)
Allocation concealment (selection bias)	Low risk	The study drug for atorvastatin was labelled in such a manner that participants and staff were unable to determine from the dispensed packaging to which treatment arm participants were assigned
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	Low risk	1/48 ((2.1%) participants given placebo were not included in the efficacy analysis All participants given atorvastatin were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	High risk	Pfizer funded the trial; efficacy data could be biased towards atorvastatin

McKenney 1998

Methods	6-Week wash-out period 12-Week multi-centre open-label randomised parallel-group study Randomly assigned in sequential order at each site, stratified by type of dyslipidaemia Evening dose
Participants	108 men and women from the USA aged 55 years (18-80) with combined hyperlipidaemia or isolated hypertriglyceridaemia; TC > 199 mg/dL (5.15 mmol/L), TG 201 to 799 mg/dL (2.27-9.02 mmol/L), BMI < 33 Exclusion criteria: hepatic dysfunction, renal dysfunction, uncontrolled HTN and diabetes, TSH > 7.0 µU/mL at screening, MI, coronary angioplasty or bypass graft, unstable angina, gall bladder disease, gout or peptic ulcer disease Atorvastatin baseline TC: 7.1 mmol/L (275 mg/dL) Atorvastatin baseline LDL-C: 4.4 mmol/L (170 mg/dL) Atorvastatin baseline HDL-C: 0.98 mmol/L (37.9 mg/dL) Atorvastatin baseline TG: 4.50 mmol/L (399 mg/dL)
Interventions	Atorvastatin 10 mg/d Nicotinic acid 1 g 3 times daily

Atorvastatin for lowering lipids (Review)

McKenney 1998 (Continued)

Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	Atorvastatin group was analysed	
Risk of bias		
Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin group: 1/55 were not included in the efficacy analysis because the participant had no treatment phase measurement within 3 days of receiving the drug 1.8% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

MERCURY II 2006

Methods	6-Week wash-out period 16-Week multi-centre open-label randomised study
Participants	1993 men and women from North and South America aged > 17 years; LDL-C 130 to 250 mg/dL (3.36-6.46 mmol/L), TG < 400 mg/dL (4.52 mmol/L) 772 people received atorvastatin, 778 received simvastatin, 383 received rosuvastatin Exclusion criteria: pregnancy or lactation; homozygous familial type I, III, IV or V hyperlipidaemia; unstable arterial disease within 3 months of trial; uncontrolled HTN or diabetes mellitus; renal and hepatic dysfunction Atorvastatin 10 mg/d baseline TC: 6.54 mmol/L (253 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.37 mmol/L (169 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.22 mmol/L (47 mg/dL) Atorvastatin 10 mg/d baseline TG: 2.08 mmol/L (184 mg/dL) Atorvastatin 20 mg/d baseline TC: 6.49 mmol/L (251 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.35 mmol/L (168 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.21 mmol/L (47 mg/dL) Atorvastatin 20 mg/d baseline TG: 2.05 mmol/L (182 mg/dL)
Interventions	Atorvastatin 10 mg/d

Atorvastatin for lowering lipids (Review)

MERCURY II 2006 (Continued)

Atorvastatin 20 mg/d

Rosuvastatin 20 mg/d

Simvastatin 20 mg/d

Simvastatin 40 mg/d

Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin groups were analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin 10 mg/d: 14/403 were not included in the efficacy analysis because they were not in the ITT group Atorvastatin 20 mg/d: 12/395 were not included in the efficacy analysis because they were not in the ITT group 3.3% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

MERCURY I 2004

Methods	6-Week wash-out period 16-Week multi-centre open-label randomised parallel-group study
Participants	3140 men and women from Europe, Canada and Australia with hypercholesterolaemia aged > 17 years; LDL-C > 2.99 mmol/L (116 mg/dL), TG < 4.52 mmol/L (401 mg/dL) 1491 participants received atorvastatin, 559 received simvastatin, 538 received pravastatin, 552 received rosuvastatin Exclusion criteria: pregnancy threat, homozygous familial or type III hypercholesterolaemia, active CVD within 2 months of screening, uncontrolled HTN, renal and hepatic dysfunction Atorvastatin 10 mg/d baseline LDL-C: 4.19 mmol/L (162 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.33 mmol/L (167 mg/dL)

Atorvastatin for lowering lipids (Review)

MERCURY I 2004 (Continued)

No baseline TC, HDL-C or TG values

Interventions	Atorvastatin 10 mg/d Atorvastatin 20 mg/d Rosuvastatin 10 mg/d Simvastatin 20 mg/d Pravastatin 40 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin groups were analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 20 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Milionis 2004

Methods	6-Week wash-out period 12-Week randomised study Evening dose
Participants	180 men and women from Greece with primary hyperlipidaemia from outpatient lipid clinic, mean age 58.5 years; TC > 240 mg/dL (6.21 mmol/L), TG < 350 mg/dL (3.95 mmol/L) 90 participants received atorvastatin, 90 received simvastatin Exclusion criteria: hepatic dysfunction, renal dysfunction, diabetes, TSH > 5.0 µU/L, any medical conditions that interfere with study protocol Atorvastatin baseline TC: 7.84 mmol/L (303 mg/dL) Atorvastatin baseline LDL-C: 5.77 mmol/L (223 mg/dL)

Atorvastatin for lowering lipids (Review)

Milionis 2004 (Continued)

Atorvastatin baseline HDL-C: 1.22 mmol/L (47.18 mg/dL)
 Atorvastatin baseline TG: 1.89 mmol/L (167 mg/dL)

Interventions	Atorvastatin 40 mg/d Simvastatin 40 mg/d
Outcomes	Per cent change from baseline at 6 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Milionis 2003

Methods	6-Week wash-out period 12-Week randomised single-centre study Evening dose
Participants	128 men and women from Greece with dyslipidaemia from an outpatient clinic; TC > 240 mg/dL (6.21 mmol/L), TG < 300 mg/dL (3.39 mmol/L) 64 participants received atorvastatin, 42 received simvastatin, 22 received fenofibrate Exclusion criteria: impaired hepatic function, alcohol abuse, impaired renal function, diabetes mellitus, thyroid dysfunction, any medical condition that might preclude successful study completion, drugs that interfere with lipid determination Atorvastatin baseline TC: 7.84 mmol/L (303 mg/dL) Atorvastatin baseline LDL-C: 5.77 mmol/L (223 mg/dL) Atorvastatin baseline HDL-C: 1.22 mmol/L (47.18 mg/dL) Atorvastatin baseline TG: 1.89 mmol/L (167 mg/dL)

Milionis 2003 (Continued)

Interventions	Atorvastatin 40 mg/d Simvastatin 40 mg/d Fenofibrate 200 mg/d
Outcomes	Per cent change from baseline at 6 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Mirdamadi 2008

Methods	6-Week diet run-in period 12-Week randomised study
Participants	164 men and women aged 21 to 70 years with untreated type IIb hyperlipidaemia 61 participants received atorvastatin, 46 received simvastatin, 57 received fluvastatin Exclusion criteria: hepatic disorders, endocrine or renal disorders, diabetes mellitus, impaired glucose tolerance, alcoholism, drug abuse, gallstones, cancer, pregnancy or lactation, use of anticoagulants or lipid-lowering therapy Atorvastatin baseline TC: 6.98 mmol/L (270 mg/dL) Atorvastatin baseline LDL-C: 4.70 mmol/L (182 mg/dL) Atorvastatin baseline HDL-C: 1.31 mmol/L (51 mg/dL)
Interventions	Atorvastatin 10 mg/d Simvastatin 10 mg/d

Atorvastatin for lowering lipids (Review)

Mirdamadi 2008 (Continued)

Simvastatin 20 mg/d

Fluvastatin 80 mg/d

Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C and HDL-C
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TG data were not reported because data were expressed as median values
Other bias	Low risk	The study appears to be free of other sources of bias

MODEST 2009

Methods	No participant received lipid-altering medication; no wash-out was required 12-Week before-and-after study
Participants	60 men and women with type 2 diabetes mellitus with clinically evident CHD Exclusion criteria: statin hypersensitivity, liver disease, overt nephropathy, pregnancy, breastfeeding, increased CK levels, postmenopausal women Baseline TC: 5.72 mmol/L (221 mg/dL) Baseline LDL-C: 3.77 mmol/L (146 mg/dL) Baseline HDL-C: 1.19 mmol/L (46 mg/dL) Baseline TG: 1.81 mmol/L (160 mg/dL)
Interventions	Atorvastatin 80 mg/d Ezetimibe/atorvastatin 10 mg/10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Atorvastatin for lowering lipids (Review)

MODEST 2009 (Continued)

SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	12/60 (20%) were not included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Monteiro 2008

Methods	<p>Participants were not receiving lipid-altering substances within 30 days of enrolment, so no wash-out was required</p> <p>6-Week double-blind randomised placebo-controlled trial</p>
Participants	<p>60 men and women with metabolic syndrome and coronary syndromes aged 30 to 75 years; LDL-C < 130 mg/dL</p> <p>Exclusion criteria: diabetes mellitus, Class III or IV heart failure, coronary revascularisation procedures within the next 6 weeks</p> <p>Placebo baseline TC: 4.94 mmol/L (191 mg/dL) Placebo baseline LDL-C: 3.00 mmol/L (116 mg/dL) Placebo baseline HDL-C: 1.01 mmol/L (39 mg/dL) Placebo baseline TG: 2.02 mmol/L (179 mg/dL)</p> <p>Atorvastatin 10 mg/d baseline TC: 4.94 mmol/L (191 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 2.97 mmol/L (115 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.06 mmol/L (41 mg/dL) Atorvastatin 10 mg/d baseline TG: 2.07 mmol/L (183 mg/dL)</p>
Interventions	<p>Placebo</p> <p>Atorvastatin 10 mg/d</p> <p>Fenofibrate 200 mg/d</p> <p>Atorvastatin/fenofibrate 10 mg/200 mg/d</p>

Atorvastatin for lowering lipids (Review)

Monteiro 2008 (Continued)

Outcomes	Per cent change from baseline at 6 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Placebo and atorvastatin monotherapy groups were analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Information about the sequence generation process was insufficient to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	Information about allocation concealment was insufficient to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; no WDAEs were reported
Other bias	Low risk	The study appears to be free of other sources of bias

Mori 2013

Methods	1 month or longer wash-out period 3-Month randomised trial
Participants	128 men and women age 20 to 80 years with hypercholesterolaemia and type 2 diabetes mellitus LDL-C \geq 100 mg/dL (2.59 mmol/L) 44 participants received atorvastatin, 42 received rosuvastatin, 42 received pravastatin Exclusion criteria: stroke or ischaemic heart disease, history within previous 6 months, liver disease, renal dysfunction, pregnancy, possibility of becoming pregnant Atorvastatin 10 mg/d baseline TC: 6.24 mmol/L (241 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.18 mmol/L (162 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.55 mmol/L (60 mg/dL) Atorvastatin 10 mg/d baseline TG: 1.52 mmol/L (135 mg/dL)
Interventions	Atorvastatin 10 mg/d Rosuvastatin 5 mg/d Pravastatin 10 mg/d
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin treatment arm was analysed

Atorvastatin for lowering lipids (Review)

Mori 2013 (Continued)

SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	2/42 (4.8%) participants were not included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	Unclear risk	The trial was partially funded by a government grant

Morishita 2001

Methods	4-Week dietary baseline stabilisation period 12-Week before-and-after study
Participants	30 men and women from Japan with primary hyperlipidaemia, mean age 55 years; TC \geq 5.7 mmol/L (220 mg/dL), TG \geq 1.7 mmol/L (151 mg/dL) Exclusion criteria: women likely to become pregnant, severe hepatic or renal disease, hypothyroidism, MI or stroke, blood coagulation drugs Baseline TC: 6.89 mmol/L (266 mg/dL) Baseline LDL-C: 4.36 mmol/L (169 mg/dL) Baseline HDL-C: 1.36 mmol/L (52.59 mg/dL) Baseline TG: 2.47 mmol/L (219 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Morishita 2001 (Continued)

Murrow 2012 (Continued)

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	High risk	Pfizer funded the trial; efficacy could be biased for atorvastatin

Muscari 2001

Methods	Participants did not receive lipid-lowering drugs for 3 months before randomisation 3-Month randomised double-blind placebo-controlled trial	
Participants	60 men aged 55 to 64 years with C3 > 1.19 g/L, TC ≥ 5.56 mmol/L Exclusion criteria: none reported <u>Placebo:</u> Baseline TC: 6.68 mmol/L (258 mg/dL) Baseline HDL-C: 1.35 mmol/L (52 mg/dL) <u>Atorvastatin:</u> Baseline TC: 6.47 mmol/L (250 mg/dL) Baseline HDL-C: 1.36 mmol/L (53 mg/dL)	
Interventions	Placebo for vitamin E low cholesterol Vitamin E low cholesterol Placebo for atorvastatin high cholesterol Atorvastatin 10 mg/d high cholesterol Atorvastatin 10 mg/d + vitamin E high cholesterol	
Outcomes	% change from baseline of TC and HDL-C	
Notes	Placebo for atorvastatin high cholesterol and atorvastatin 10 mg/d high cholesterol were analysed SDs were imputed WDAEs were not reported	

Muscari 2001 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blindly"
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	3/30 participants who received atorvastatin only were not analysed (10%); some bias is possible
Selective reporting (reporting bias)	High risk	LDL-C and TG data were not reported; WDAEs were not reported
Other bias	Low risk	The study appears to be free of other sources of bias

Nagila 2009

Methods	Participants were not receiving lipid-altering agents, so no wash-out was required 12-Week before-and-after trial
Participants	22 men and women with hypercholesterolaemia, mean age of 58 years; LDL-C 3.4 to 6.2 mmol/L Exclusion criteria: CVD, diabetes mellitus, HTN, hepatic and renal dysfunction, hyperthyroidism, cancer, alcoholism, smoking, drug addiction, pregnancy and lactation in women
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Nagila 2009 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Naoumova 1996

Methods	4-Week wash-out period 6-Week single evening dose of 80 mg or 40 mg BID; participants were analysed as 1 group for the atorvastatin group 18-Week multi-centre double-blind dose-titration comparison of simvastatin vs pravastatin
Participants	35 men and women from South Africa with FH, aged 21 to 53 years; BMI 19 to 32 21 participants received atorvastatin, 7 received pravastatin, 7 received simvastatin Atorvastatin baseline TC: value not given Atorvastatin baseline LDL-C: 7.77 mmol/L (300 mg/dL) Atorvastatin baseline HDL-C: 1.25 mmol/L (48.34 mg/dL) Atorvastatin baseline TG: 1.32 mmol/L (117 mg/dL)
Interventions	Atorvastatin 80 mg/d Pravastatin 10 mg/d Pravastatin 20 mg/d Pravastatin 40 mg/d Simvastatin 10 mg/d Simvastatin 20 mg/d Simvastatin 40 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed TC data were not reported SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Naoumova 1996 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	Total cholesterol-lowering efficacy was not reported
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Naoumova 1997

Methods	1-Month wash-out period 1-Month study Evening dose
Participants	21 men and women from the UK, mean age 51 years (< 65) with heterozygous FH; LDL-C > 5.1 mmol/L (197 mg/dL) 21 participants received simvastatin for 1 month, then were washed out for 1 month, then received atorvastatin for 1 month Exclusion criteria: hepatic dysfunction, cyclosporine, BMI > 35 Atorvastatin baseline TC: 11.84 mmol/L (458 mg/dL) Atorvastatin baseline LDL-C: 9.56 mmol/L (370 mg/dL) Atorvastatin baseline HDL-C: 1.08 mmol/L (42 mg/dL) Atorvastatin baseline TG: 2.38 mmol/L (211 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 1 month Simvastatin 40 mg/d for 0 to 1 month
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Atorvastatin for lowering lipids (Review)

Naoumova 1997 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	1/21 was not included in the efficacy analysis because of difficulty in obtaining blood samples 4.8% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Naoumova 2003

Methods	4-Week placebo wash-out period 12-Week single-blind titration study
Participants	17 men and women with heterozygous FH aged 51 years Baseline TC: 11.9 mmol/L (460 mg/dL) Baseline LDL-C: 9.6 mmol/L (371 mg/dL) Baseline HDL-C: 1.1 mmol/L (43 mg/dL) Baseline TG: 2.6 mmol/L (230 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 4 weeks Atorvastatin 40 mg/d for 4 to 12 weeks
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed SDs were imputed TG data were not analysed because they were expressed as geometric means

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Naoumova 2003 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

NASDAC 2005

Methods	8-Week wash-out period 8-Week multi-centre randomised double-blind parallel-group before-and-after study
Participants	<p>919 men and women with dyslipidaemia from USA, aged 18 to 80 years; LDL-C > 100 mg/dL (2.6 mmol/L), TG < 600 mg/dL (6.8 mmol/L)</p> <p>Exclusion criteria: statin hypersensitivity, gastrointestinal disease, hepatic dysfunction, uncontrolled HTN, alcohol or drug abuse, pregnancy threat, renal dysfunction, uncontrolled hypothyroidism, severe disease within 3 months of screening</p> <p>Atorvastatin 10 mg/d baseline TC: 6.56 mmol/L (254 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.44 mmol/L (172 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.23 mmol/L (48 mg/dL) Atorvastatin 10 mg/d baseline TG: 1.96 mmol/L (174 mg/dL)</p> <p>Atorvastatin 20 mg/d baseline TC: 6.56 mmol/L (254 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.33 mmol/L (167 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.16 mmol/L (45 mg/dL) Atorvastatin 20 mg/d baseline TG: 2.32 mmol/L (205 mg/dL)</p> <p>Atorvastatin 40 mg/d baseline TC: 6.56 mmol/L (254 mg/dL) Atorvastatin 40 mg/d baseline LDL-C: 4.44 mmol/L (172 mg/dL) Atorvastatin 40 mg/d baseline HDL-C: 1.21 mmol/L (47 mg/dL) Atorvastatin 40 mg/d baseline TG: 1.97 mmol/L (174 mg/dL)</p> <p>Atorvastatin 80 mg/d baseline TC: 6.79 mmol/L (263 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 4.57 mmol/L (177 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.18 mmol/L (46 mg/dL) Atorvastatin 80 mg/d baseline TG: 2.28 mmol/L (202 mg/dL)</p>
Interventions	Atorvastatin 10 mg/d Atorvastatin 20 mg/d Atorvastatin 40 mg/d Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was in-

Atorvastatin for lowering lipids (Review)

NASDAC 2005 (Continued)

		cluded for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	<p>Atorvastatin 20 mg/d: 3/228 were not included in the efficacy analysis because participants did not have at least 1 post-baseline observation</p> <p>Atorvastatin 40 mg/d: 2/231 were not included in the efficacy analysis because participants did not have at least 1 post-baseline observation</p> <p>Atorvastatin 80 mg/day: 2/231 were not included in the efficacy analysis because participants did not have at least 1 post-baseline observation</p> <p>1% of participants were excluded from the efficacy analysis</p>
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer Inc funded the study; data may support bias for atorvastatin

Nawrocki 1995

Methods	8-Week dietary wash-out period 6-Week double-blind randomised placebo-controlled parallel-group multi-centre study Evening doses
Participants	81 outpatients from Canada and the USA with primary hypercholesterolaemia; men and women aged 54 years (18-70); LDL-C 4.15 to 6.20 mmol/L (160-240 mg/dL), TG < 3.39 mmol/L (300 mg/dL) 12 participants received placebo, 67 received atorvastatin Exclusion criteria: uncontrolled HTN, diabetes, endocrine disease, liver and renal dysfunction, drugs that affect serum lipids > 14 oz/wk of ethanol equivalents No baseline lipid values were given
Interventions	Placebo Atorvastatin 2.5 mg/d Atorvastatin 5 mg/d Atorvastatin 10 mg/d Atorvastatin 20 mg/d Atorvastatin 40 mg/d Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG

Atorvastatin for lowering lipids (Review)

Nawrocki 1995 (Continued)

Notes WDAEs were reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	High risk	"Randomization code prepared by the Parke-Davis Biometrics Department"
Allocation concealment (selection bias)	Unclear risk	Information about allocation concealment was insufficient to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Patients received either one bottle containing 2.5, 5, 10, 20, 40 mg atorvastatin capsules and one bottle with matching placebo capsules, two bottles with atorvastatin 40 mg capsules; or two bottles with placebo capsules. The appearance of the capsules did not change throughout the baseline and double-blind phases of the study"
Incomplete outcome data (attrition bias) All outcomes	Low risk	2/81 were not included in the efficacy analysis; the participants withdrew after 2 days because they had been incorrectly entered 2.4% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Neil 1999

Methods	5-Week wash-out period 17-Week open-label non-comparative study
Participants	399 men and women from Ireland and the UK with CHD, mean age 64 years (18 to 80); LDL-C > 3.4 mmol/L (131 mg/dL), TG < 5.5 mmol/L (487 mg/dL) Exclusion criteria: women likely to become pregnant or breastfeeding, active liver disease or hepatic dysfunction, MI, inhibitor hypersensitivity, alcohol abuse, lipid-altering drugs, long-term immunosuppressant use Baseline TC: 6.41 mmol/L (248 mg/dL) Baseline LDL-C: 4.37 mmol/L (169 mg/dL) Baseline HDL-C: 1.23 mmol/L (48 mg/dL) Baseline TG: 1.76 mmol/L (156 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 5 weeks Atorvastatin conditional titration doses of 20 to 80 mg/d for 5 to 17 weeks
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Other bias	Unclear risk	No source of funding was provided

Okopien 2004

Methods	3-Month dietary baseline stabilisation period 30-Day before-and-after study
Participants	18 individuals with primary isolated hypercholesterolaemia; TC > 200 mg/dL, LDL-C > 135 mg/dL, TG < 200 mg/dL Exclusion criteria: other types of primary dyslipidaemia, secondary dyslipidaemia in the course of diabetes mellitus, autoimmune disorder, thyroid disorder, chronic pancreatitis, nephrotic syndrome, liver and biliary tract disease, obesity, alcohol abuse, acute or chronic inflammatory process, symptomatic congestive heart failure, unstable coronary artery disease, MI or stroke within 6 months preceding the study, moderate and severe arterial HTN, impaired renal or hepatic function, malabsorption syndrome, treatment with drugs that affect serum lipids, HRT, oral contraception, poor patient compliance Baseline TC: 7.50 mmol/L (290mg/dL) Baseline LDL-C: 5.38 mmol/L (208 mg/dL) Baseline HDL-C: 1.24 mmol/L (48 mg/dL) Baseline TG: 1.74 mmol/L (154 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 30 days of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported

Atorvastatin for lowering lipids (Review)

Okopien 2004 (Continued)

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Okopien 2005

Methods	6-Week wash-out period 4-Week double-blind randomised, placebo-controlled study Evening dose	
Participants	36 men and women from Poland with primary mixed dyslipidaemia, aged 41 to 64 years, TC > 200 mg/dL (5.17 mmol/L), LDL-C > 135 mg/dL (3.49 mmol/L), TG > 200 mg/dL (2.26 mmol/L) 18 participants received placebo, 18 received atorvastatin, 16 received fenofibrate Exclusion criteria: secondary dyslipidaemia, acute or chronic inflammatory disease, congestive heart failure, uncontrolled HTN, cardiovascular events within 6 months of study, renal and hepatic dysfunction, use of other hypolipaeamic drugs within 3 months of study, malabsorption syndrome, confounding factors, HRT, poor patient compliance Placebo baseline TC: 7.33 mmol/L (283 mg/dL) Placebo baseline LDL-C: 4.97 mmol/L (192 mg/dL) Placebo baseline HDL-C: 0.87 mmol/L (34 mg/dL) Placebo baseline TG: 3.06 mmol/L (271 mg/dL) Atorvastatin baseline TC: 7.50 mmol/L (290 mg/dL) Atorvastatin baseline LDL-C: 5.38 mmol/L (208 mg/dL) Atorvastatin baseline HDL-C: 1.01 mmol/L (39 mg/dL) Atorvastatin baseline TG: 2.83 mmol/L (251 mg/dL)	
Interventions	Placebo Atorvastatin 20 mg/d Fenofibrate 267 mg/d	
Outcomes	Per cent change from baseline at 30 days of serum TC, LDL-C, HDL-C and TG	
Notes	Placebo and atorvastatin groups were analysed SDs were imputed WDAEs were reported	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind fashion"

Okopien 2005 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Olsson 2001

Methods	6-Week wash-out period 6-Week open-label randomised parallel-group trial for the atorvastatin study 6-Week randomised double-blind placebo-controlled study for the rosuvastatin trial
Participants	206 men and women from Northern Europe aged 18 to 70 years with hypercholesterolaemia; BMI \leq 30, LDL-C 4.14 to 6.21 mmol/L (160-240 mg/dL), TG < 3.39 mmol/L (300 mg/dL) 31 participants received placebo, 28 received atorvastatin, 137 received rosuvastatin Exclusion criteria: active arterial disease, active cancer, uncontrolled HTN, diabetes, hypothyroidism, homozygous FH, hepatic dysfunction Placebo baseline TC: 7.00 mmol/L (271 mg/dL) Placebo baseline LDL-C: 5.10 mmol/L (197 mg/dL) Placebo baseline HDL-C: 1.40 mmol/L (54 mg/dL) Placebo baseline TG: 1.40 mmol/L (124 mg/dL) Atorvastatin 10 mg/d baseline TC: 6.80 mmol/L (263 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.90 mmol/L (189 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.30 mmol/L (50 mg/dL) Atorvastatin 10 mg/d baseline TG: 1.40 mmol/L (124 mg/dL) Atorvastatin 80 mg/d baseline TC: 6.90 mmol/L (267 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 5.00 mmol/L (193 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.20 mmol/L (46 mg/dL) Atorvastatin 80 mg/d baseline TG: 1.40 mmol/L (124 mg/dL)
Interventions	Placebo Atorvastatin 10 mg/d Atorvastatin 80 mg/d Rosuvastatin 1 mg/d Rosuvastatin 2.5 mg/d Rosuvastatin 5 mg/d Rosuvastatin 10 mg/d Rosuvastatin 20 mg/d Rosuvastatin 40 mg/d Rosuvastatin 80 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG

Atorvastatin for lowering lipids (Review)

Olsson 2001 (Continued)

Notes Placebo and atorvastatin groups were analysed
 WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	High risk	Open-label study
Allocation concealment (selection bias)	High risk	Open-label study
Blinding (performance bias and detection bias) All outcomes	High risk	Open-label study
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	<p>Placebo: 2/31 were not included in the efficacy analysis: 1 because of an adverse event and 1 because of major protocol violations</p> <p>Atorvastatin 10 mg/d: 2/15 were not included in the efficacy analysis: 1 because of an adverse event and 1 because of major protocol violations</p> <p>Atorvastatin 80 mg/d: 3/13 were not included in the efficacy analysis: 1 because of an adverse event and 2 because of major protocol violations</p> <p>12% of participants were excluded from the efficacy analysis</p>
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Olsson 2002

Methods	6-Week wash-out period 52-Week multi-centre double-blind randomised study
Participants	<p>412 men and women from Northern Europe, mean age 58 years (29-79); LDL-C 160 to 249 mg/dL (4.14-6.44 mmol/L), TG ≤ 400 mg/dL (4.52 mmol/L)</p> <p>140 participants received atorvastatin, 272 received rosuvastatin</p> <p>Exclusion criteria: use of lipid-modifying drugs</p> <p>Atorvastatin baseline TC: 7.08 mmol/L (274 mg/dL)</p> <p>Atorvastatin baseline LDL-C: 4.86 mmol/L (188 mg/dL)</p> <p>Atorvastatin baseline HDL-C: 1.39 mmol/L (54 mg/dL)</p> <p>Atorvastatin baseline TG: 1.81 mmol/L (160 mg/dL)</p>
Interventions	<p>Atorvastatin 10 mg/d</p> <p>Rosuvastatin 5 mg/d</p> <p>Rosuvastatin 10 mg/d</p>
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG

Olsson 2002 (Continued)

Notes Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for analysis, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for analysis, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for analysis, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin group: 1/140 was not included in the efficacy analysis because this participant had not received trial medication or because baseline or post-baseline efficacy assessment was not performed 0.7% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Ong 2011

Methods	<p>Participants were not receiving lipid-lowering medications within 6 weeks of the trial; no wash-out was required</p> <p>52-Week multi-centre open-label single-arm study</p>
Participants	<p>114 men and women with primary hypercholesterolaemia > 18 years old; LDL-C 100 to 290 mg/dL (2.6-7.5 mmol/L)</p> <p>85 participants received atorvastatin</p> <p>Exclusion criteria: hypersensitivity or muscle toxicity to statins, hereditary muscle disease, uncontrolled diabetes mellitus, treatment with lipid-lowering drugs within 6 weeks of the trial, elevated liver enzymes > 1.5 × ULN, CPK > 5 × ULN, serum creatinine > 1.2 × ULN, serum TG > 5.56 mmol/L (492 mg/dL)</p> <p>Atorvastatin baseline TC: 4.46 mmol/L (172 mg/dL) Atorvastatin baseline LDL-C: 4.37 mmol/L (169 mg/dL)</p>
Interventions	<p>Atorvastatin 10 mg/d for 0 to 4 weeks</p> <p>Atorvastatin 20 mg/d for 4 to 8 weeks</p> <p>Atorvastatin 20 mg/d for 8 to 52 weeks</p>
Outcomes	Per cent change from baseline at 4 weeks of serum TC and LDL-C
Notes	Atorvastatin 10 mg/d for 0 to 4 week group was included in the efficacy analysis

Ong 2011 (Continued)

HDL-C and triglycerides per cent change from baseline data were not included because given and calculated values were different by more than 10%

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	29/114 were not included in the efficacy analysis because of follow-up loss, pregnancy, adverse events, transfer to other centres, lack of consent 25% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	High risk	HDL-C and triglycerides were not included in the efficacy analysis
Other bias	High risk	Ranbaxy Sdn Bhd funded the study; data may support bias against atorvastatin

Ooi 1997

Methods	6-Week wash-out period 24-Week open-label randomised multi-centre study
Participants	84 outpatients from Canada with combined hyperlipidaemia aged 18 to 80 years; BMI < 33 Exclusion criteria: pregnancy, liver and kidney dysfunction, uncontrolled HTN, hypothyroidism, diabetes, consuming > 10 alcoholic drinks per week, drug abuse, TC 5.2 to 9.0 mmol/L (201-348 mg/dL), LDL-C > 3.5 mmol/L (135 mg/dL), TG > 2.3 mmol/L (204 mg/dL) 41 participants received atorvastatin, 43 received fenofibrate Atorvastatin baseline TC: 7.65 mmol/L (296 mg/dL) Atorvastatin baseline LDL-C: 4.84 mmol/L (187 mg/dL) Atorvastatin baseline HDL-C: 0.96 mmol/L (37.12 mg/dL) Atorvastatin baseline TG: 4.34 mmol/L (384 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 12 weeks Atorvastatin 20 mg/d for 12 to 24 weeks Fenofibrate 100 mg TID for 0 to 24 weeks
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Ooi 1997 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin group: 1/41 were not included in the efficacy analysis 2.4% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Oranje 2001

Methods	6-Week wash-out period 3-Month single-centre double-blind randomised placebo-controlled study Evening doses
Participants	Type 2 diabetic individuals from the Netherlands were recruited from an outpatient endocrinology clinic, BMI < 35, HbA1c < 10%, TC < 6.5 mmol/L (251 mg/dL) Exclusion criteria: none reported Placebo baseline TC: 5.33 mmol/L (206 mg/dL) Placebo baseline LDL-C: 2.76 mmol/L (107 mg/dL) Placebo baseline HDL-C: 1.39 mmol/L (54 mg/dL) Atorvastatin baseline TC: 5.62 mmol/L (217 mg/dL) Atorvastatin baseline LDL-C: 3.22 mmol/L (125 mg/dL) Atorvastatin baseline HDL-C: 0.87 mmol/L (34 mg/dL)
Interventions	Placebo Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed. TG data were not analysed because per cent change from baseline was expressed as a median value WDAEs were not reported

Risk of bias
Atorvastatin for lowering lipids (Review)

Oranje 2001 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information on allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"In this double-blind"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	Low risk	The study appears to be free of other sources of bias

Orem 2002

Methods	No participants were receiving lipid-lowering therapy before entry into the study; therefore no wash-out baseline stabilisation period was required 12-Week before-and-after trial	
Participants	38 men and women from Turkey with dyslipidaemia aged 54 years (35-71); BMI 26.4 Exclusion criteria: hypothyroidism, diabetes mellitus, nephrotic syndrome, renal insufficiency, hepatic dysfunction, cancer, immune disorder, uncontrolled HTN, smoking, CAD Baseline TC: 7.37 mmol/L (285 mg/dL) Baseline LDL-C: 5.24 mmol/L (203 mg/dL) Baseline HDL-C: 1.06 mmol/L (41 mg/dL) Baseline TG: 2.20 mmol/L (195 mg/dL)	
Interventions	Atorvastatin 10 mg/d	
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Orem 2002 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Orr 2009

Methods	Participants were not taking any medications; no wash-out was required 12-Week double-blind randomised placebo-controlled trial	
Participants	26 obese men and women aged 40 to 65 years; BP < 160/100 mmHg, TC < 300 mg/dL, TG < 450 mg/dL Exclusion criteria: elevated transaminase levels, BMI ≥ 25 kg/m ² , brachial arterial BP ≤ 159/99 mmHg Placebo baseline TC: 5.87 mmol/L (227 mg/dL) Placebo baseline LDL-C: 4.19 mmol/L (162 mg/dL) Placebo baseline HDL-C: 1.11 mmol/L (43 mg/dL) Placebo baseline TG: 1.41 mmol/L (125 mg/dL) Atorvastatin 80 mg/d baseline TC: 5.46 mmol/L (211 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 3.85 mmol/L (149 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.14 mmol/L (44 mg/dL) Atorvastatin 80 mg/d baseline TG: 1.39 mmol/L (123 mg/dL)	
Interventions	Placebo Atorvastatin 80 mg/d	
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C, TG There were no adverse events reported during the study	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Information about sequence generation was insufficient to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	Information about allocation concealment was insufficient to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind

Atorvastatin for lowering lipids (Review)

Orr 2009 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured; WDAEs were reported
Other bias	High risk	Pfizer funded the trial

Ozerkan 2006

Methods	12-Week dietary stabilisation period 12-Week prospective non-randomised open-label study
Participants	15 men and women aged ≥ 18 years with hyperlipidaemia with insulin resistance; TC > 240 mg/dL (6.21 mmol/L), TG 200 to 400 mg/dL (2.26-4.52 mmol/L) Exclusion criteria: obese, SBP/DBP $\geq 130/85$ mmHg or receiving antihypertensive medication, impaired glucose tolerance, hepatic insufficiency, renal insufficiency, CK $\geq 3 \times$ ULN, secondary hyperlipidaemia, alcohol abuse; use of medication affecting insulin, glucose or lipid metabolism; psychiatric problems, pregnant, could become pregnant, breastfeeding Baseline TC: 7.01 mmol/L (271 mg/dL) Baseline LDL-C: 4.48 mmol/L (173 mg/dL) Baseline HDL-C: 1.18 mmol/L (46 mg/dL) Baseline TG: 3.04 mmol/L (269 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured

Atorvastatin for lowering lipids (Review)

Ozerkan 2006 (Continued)

Other bias	Unclear risk	No source of funding was provided
------------	--------------	-----------------------------------

Ozsoy 2003

Methods	6-Week wash-out period 6-Week before-and-after study
Participants	150 men and women from the Netherlands with dyslipidaemia or early renal failure, mean age 45 years (18-75); outpatient nephrology clinic, LDL-C > 2.6 mmol/L (100 mg/dL), HDL-C > 1.1 mmol/L (42.5 mg/dL), TG < 1.7 mmol/L (151 mg/dL) 60 participants received atorvastatin Exclusion criteria: none Baseline TC: 6.13 mmol/L (237 mg/dL) Baseline LDL-C: 3.94 mmol/L (152 mg/dL) Baseline HDL-C: 1.43 mmol/L (55.3 mg/dL) Baseline TG: 1.72 mmol/L (152 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	-

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	6 weeks: 90/150 were not included in the selection process: "the first 60 consecutive patients with elevated LDL-C were treated uniformly with a cholesterol-lowering diet and atorvastatin 10 mg daily" 60% of participants were excluded from the efficacy analysis Risk of bias is high
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Pacanowski 2008

Methods	No participant received lipid-lowering therapy; therefore no wash-out period was required 8-Week before-and-after trial
Participants	84 healthy men and women from the USA Exclusion criteria: coronary disease, carotid artery disease, peripheral vascular disease, diabetes, aneurysm, dyslipidaemia, Framingham 10-year risk > 20%, cancer, pregnancy, hepatic dysfunction, alcohol abuse, muscle pain Baseline TC: 4.73 mmol/L (183 mg/dL) Baseline LDL-C: 2.64 mmol/L (102 mg/dL) Baseline HDL-C: 1.58 mmol/L (61 mg/dL) Baseline TG: 1.13 mmol/L (100 mg/dL)
Interventions	Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Paiva 2005

Methods	Participants received no lipid-altering medications before randomisation; therefore no wash-out period was required 8-Week randomised double-blind placebo-controlled trial
Participants	48 men and women aged 31 to 69 years; TC 5.9 mmol/L, TG < 4.5 mmol/L Exclusion criteria: TC > 7.0 mmol/L, individuals with FH, women of childbearing potential, use of antioxidant vitamins, renal or hepatic dysfunction, medications that alter statin metabolism

Atorvastatin for lowering lipids (Review)

Paiva 2005 (Continued)

Placebo:

Baseline TC: 5.90 mmol/L (228 mg/dL)
 Baseline LDL-C: 3.68 mmol/L (142 mg/dL)
 Baseline HDL-C: 1.41 mmol/L (54.5 mg/dL)
 Baseline TG: 1.79 mmol/L (159 mg/dL)

Atorvastatin:

Baseline TC: 5.80 mmol/L (224 mg/dL)
 Baseline LDL-C: 3.65 mmol/L (141 mg/dL)
 Baseline HDL-C: 1.27 mmol/L (49 mg/dL)
 Baseline TG: 1.94 mmol/L (172 mg/dL)

Interventions	Placebo Atorvastatin 40 mg/d Simvastatin 80 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Placebo and atorvastatin groups were analysed SDs were imputed WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Low risk	All study drugs were supplied in sealed, identical, numbered containers
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind; all investigators and participants were blinded until analyses were done
Incomplete outcome data (attrition bias) All outcomes	Low risk	2/16 in the placebo group were not analysed (12.5%) 1/16 in the atorvastatin group was not analysed (6.25%) 3/32 were not included in the efficacy analysis (9.4%)
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	Low risk	The study appears to be free of other sources of bias

PAPAGO-T 2013

Methods	4-Week dietary lead-in period 12-Week randomised double-blind study
---------	--

Atorvastatin for lowering lipids (Review)

PAPAGO-T 2013 (Continued)

Participants	<p>225 men and women aged 20 or older with LDL-C > 100 mg/dL (2.59 mmol/L) with hypercholesterolaemia with and without type 2 diabetes mellitus</p> <p>HDL-C < 40 mg/dL (1.03 mmol/L)</p> <p>Exclusion criteria: statin hypersensitivity, hepatic dysfunction, renal dysfunction, pregnancy, possible pregnancy or breastfeeding, poorly controlled diabetes mellitus</p> <p>113 participants received atorvastatin</p> <p>112 participants received pitavastatin</p> <p>Atorvastatin 10 mg/d baseline TC: 5.53 mmol/L (214 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 3.91 mmol/L (151 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.25 mmol/L (48 mg/dL) Atorvastatin 10 mg/d baseline TG: 1.73 mmol/L (153 mg/dL)</p>
Interventions	<p>Atorvastatin 10 mg/d</p> <p>Pitavastatin 2 mg/d</p>
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin 10 mg/d treatment arm was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; treatment arm was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	Unclear risk	Kowa Ltd funded the trial

Papathanasiou 2008

Methods	<p>No participants were receiving any medication; therefore no wash-out period was required</p> <p>1-Month trial</p>
Participants	83 men and women with ACS from Greece: Group A consisted of 34 people aged 58 years (42-78); BMI 26.9

Atorvastatin for lowering lipids (Review)

Papathanasiou 2008 (Continued)

Exclusion criteria: individuals who did not meet the criteria for non-ST-segment elevation; acute coronary syndrome, $Lp_a \geq 0.8$ mg/dL, angiographically normal coronary arteries, individuals who did not undergo any revascularisation procedure, individuals who underwent CABG

Baseline TC: 6.43 mmol/L (249 mg/dL)

Baseline LDL-C: 4.28 mmol/L (166 mg/dL)

Interventions	Group A atorvastatin 40 mg/d for 3 months Group B atorvastatin 40 mg/d for 3 to 5 days
Outcomes	Per cent change from baseline from 1 to 3 months of serum TC and LDL-C
Notes	Group A was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d for 3 months; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d for 3 months; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d for 3 months; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	Serum HDL-C and TG were not measured
Other bias	Unclear risk	The source of funding was not provided

Parhofer 2000

Methods	4-Week wash-out period 4-Week before-and-after study
Participants	10 healthy men from Germany, mean age 30 years; BMI 22 Baseline TC: 4.84 mmol/L (187 mg/dL) Baseline LDL-C: 3.00 mmol/L (116 mg/dL) Baseline HDL-C: 1.17 mmol/L (45.24 mg/dL) Baseline TG: 1.47 mmol/L (130 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Atorvastatin for lowering lipids (Review)

Parhofer 2000 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals partially funded the study; data may support bias for atorvastatin

Parhofer 2003

Methods	No participants were taking any medication; therefore no wash-out period was required 4-Week before-and-after trial
Participants	10 healthy hypertriglyceridaemic individuals, 8 men and 2 women, aged 40 years; BMI 27 Exclusion criteria: none reported Baseline TC: 5.74 mmol/L (222 mg/dL) Baseline LDL-C: 3.18 mmol/L (123 mg/dL) Baseline HDL-C: 0.85 mmol/L (33 mg/dL) Baseline TG: 3.90 mmol/L (345 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of plasma TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Parhofer 2003 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer partially funded the study; data results may be biased towards atorvastatin

Park 2010

Methods	6-Week wash-out dietary baseline stabilisation period 6-Week multi-centre randomised open-label trial	
Participants	178 men and women with metabolic syndrome and hypercholesterolaemia aged ≥ 18 years; LDL-C ≥ 130 to < 220 mg/dL, TG ≥ 150 mg/dL (1.70 mmol/L) or < 400 mg/dL (4.52 mmol/L), HDL-C men < 40 mg/dL, HDL-C women < 50 mg/dL, BP $\geq 130/85$ mmHg Exclusion criteria: pregnant, cancer, diabetes mellitus, unstable angina, MI, stroke, coronary artery bypass surgery or angioplasty within 2 months of enrolment Baseline TC: 6.17 mmol/L (239 mg/dL) Baseline LDL-C: 4.24 mmol/L (164 mg/dL) Baseline HDL-C: 1.03 mmol/L (40 mg/dL) Baseline TG: 1.97 mmol/L (174 mg/dL)	
Interventions	Atorvastatin 10 mg/d Rosuvastatin 10 mg/d	
Outcomes	Per cent change from baseline at 6 weeks of plasma TC, LDL-C, HDL-C and TG	
Notes	Atorvastatin group was analysed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Park 2010 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	1% of participants were not analysed
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the trial

Pfizer Inc 16

Methods	8-Week dietary baseline wash-out stabilisation period 12-Week multi-centre double-blind placebo-controlled randomised parallel-group dose-response study for torcetrapib and torcetrapib-atorvastatin combination doses 12-Week multi-centre open-label placebo-controlled randomised parallel-group dose-response study for atorvastatin doses
Participants	614 men and women were screened 459 men and women with hypercholesterolaemia aged 20 to 64 years inclusive; BMI < 30 kg/m ² , LDL-C ≥ 140 mg/dL (3.62 mmol/L), randomly assigned 26 participants received placebo-atorvastatin/placebo-torcetrapib 28 participants received atorvastatin 5 mg/d / placebo-torcetrapib 32 participants received atorvastatin 10 mg/d / placebo-torcetrapib 30 participants received atorvastatin 20 mg/d / placebo-torcetrapib 31 participants received placebo-atorvastatin / torcetrapib 30 mg/d 29 participants received atorvastatin 5 mg/d / torcetrapib 30 mg/d 28 participants received atorvastatin 10 mg/d / torcetrapib 30 mg/d 29 participants received atorvastatin 20 mg/d / torcetrapib 30 mg/d 31 participants received placebo-atorvastatin / torcetrapib 60 mg/d 28 participants received atorvastatin 5 mg/d / torcetrapib 60 mg/d 29 participants received atorvastatin 10 mg/d / torcetrapib 60 mg/d 23 participants received atorvastatin 20 mg/d / torcetrapib 60 mg/d 29 participants received placebo-atorvastatin / torcetrapib 90 mg/d 28 participants received atorvastatin 5 mg/d / torcetrapib 90 mg/d 28 participants received atorvastatin 10 mg/d / torcetrapib 90 mg/d 30 participants received atorvastatin 20 mg/d / torcetrapib 90 mg/d Exclusion criteria: prolonged QTc interval, history of uterine cancer

Pfizer Inc 16 (Continued)

No baseline lipid parameters were reported

Interventions	Placebo-atorvastatin / placebo-torcetrapib for 0 to 12 weeks Atorvastatin 5 mg/d / placebo-torcetrapib for 0 to 12 weeks Atorvastatin 10 mg/d / placebo-torcetrapib for 0 to 12 weeks Atorvastatin 20 mg/d / placebo-torcetrapib for 0 to 12 weeks Placebo-atorvastatin / torcetrapib 30 mg/d for 0 to 12 weeks Placebo-atorvastatin / torcetrapib 60 mg/d for 0 to 12 weeks Placebo-atorvastatin / torcetrapib 90 mg/d for 0 to 12 weeks Atorvastatin 5 mg/d / torcetrapib 30 mg/d for 0 to 12 weeks Atorvastatin 5 mg/d / torcetrapib 60 mg/d for 0 to 12 weeks Atorvastatin 5 mg/d / torcetrapib 90 mg/d for 0 to 12 weeks Atorvastatin 10 mg/d / torcetrapib 30 mg/d for 0 to 12 weeks Atorvastatin 10 mg/d / torcetrapib 60 mg/d for 0 to 12 weeks Atorvastatin 10 mg/d / torcetrapib 90 mg/d for 0 to 12 weeks Atorvastatin 20 mg/d / torcetrapib 30 mg/d for 0 to 12 weeks Atorvastatin 20 mg/d / torcetrapib 60 mg/d for 0 to 12 weeks Atorvastatin 20 mg/d / torcetrapib 90 mg/d for 0 to 12 weeks
---------------	--

Outcomes	Per cent change from baseline at 12 weeks of serum LDL-C and HDL-C
----------	--

Notes	Placebo and atorvastatin monotherapy groups were analysed WDAEs were reported
-------	--

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	High risk	Open-label
Allocation concealment (selection bias)	High risk	Open-label
Blinding (performance bias and detection bias) All outcomes	High risk	Open-label
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin 5 mg/d / placebo-torcetrapib: 2/28 were not included in the efficacy analysis 1.7% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	High risk	TC and TG data were not reported

Pfizer Inc 16 (Continued)

Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin
------------	-----------	---

Pfizer Inc 19

Methods	6-Week dietary lead-in phase 24-Week open-label randomised parallel-arm multi-centre study
Participants	99 men and women, TC > 200 mg/dL (5.17 mmol/L), TG < 800 mg/dL (9.03 mmol/L) 47 participants received atorvastatin, 52 received fenofibrate Exclusion criteria: women of childbearing potential or lactation, > 14 alcoholic drinks per week, taking insulin or oral hypoglycaemic agents, renal or hepatic dysfunction, conditions that affected serum lipids, HTN, participating in another study within 30 days of screening Atorvastatin baseline TC: 7.45 mmol/L (288 mg/dL) Atorvastatin baseline TG: 4.54 mmol/L (402 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 12 weeks Atorvastatin 20 mg/d for 12 to 24 weeks Fenofibrate 100 mg TID for 0 to 24 weeks
Outcomes	Per cent change from baseline at 12 weeks of serum TC and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	1/47 was not included in the efficacy analysis because of an adverse event allergic response 2.1% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	High risk	LDL-C and HDL-C data were not reported
Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin

Pirkova 2007

Methods	3-Week dietary baseline stabilisation period 12-Week before-and-after study
Participants	20 men aged 57 years with documented CAD, history of MI, Class II or III angina, HTN, CHD with plasma TC > 5.2 mmol/L (201 mg/dL), LDL-C > 3.0 mmol/L (116 mg/dL), TG > 4.5 mmol/L (399 mg/dL) Exclusion criteria: unstable angina, MI within 6 months of study enrolment, familial hyperlipidaemia, severe liver and kidney disease, diabetes mellitus, congestive heart failure, cardiac arrhythmia, severe HTN, surgery within the previous 6 months with accompanying acute inflammatory disease Baseline TC: 6.36 mmol/L (246mg/dL) Baseline LDL-C: 4.50 mmol/L (174 mg/dL) Baseline HDL-C: 1.14 mmol/L (44 mg/dL) Baseline TG: 2.00 mmol/L (177 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

PITCH 2012

Methods	No wash-out period was required because no participants were receiving any lipid-altering agents 12-Week randomised open-label dose-titration study
Participants	202 men and women aged 25 to 75 years with elevated ALT (≥ 1.25 times and ≤ 2.5 times ULN), 40 IU/L LDL-C ≥ 3.36 mmol/L (≥ 130 mg/dL)

Atorvastatin for lowering lipids (Review)

PITCH 2012 (Continued)

99 participants received atorvastatin, 103 received pitavastatin

Exclusion criteria: overt and irreversible liver cirrhosis, viral hepatitis, serum bilirubin $> 2 \times$ ULN

TG ≥ 4.52 mmol/L (400 mg/dL), acute or unstable conditions such as recent MI, advanced heart failure, renal dysfunction, uncontrolled hypertension, thyroid dysfunction

Atorvastatin baseline TC: 5.81 mmol/L (225 mg/dL)

Atorvastatin baseline LDL-C: 3.85 mmol/L (149 mg/dL)

Atorvastatin baseline HDL-C: 1.13 mmol/L (43.7 mg/dL)

Atorvastatin baseline TG: 2.53 mmol/L (224 mg/dL)

Interventions	Atorvastatin 10 mg/d for 4 weeks Atorvastatin 20 mg/d for 4 to 12 weeks Pitavastatin 2 mg/d for 4 weeks Pitavastatin 4 mg/d for 4 to 12 weeks
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin 10 mg/d for 4 weeks; intervention was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	14/99 (14%) participants were not included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	JW Pharmaceutical Co Korea funded the study

Plakogiannis 2002

Methods	No participant received lipid-altering medication 4 months before the trial; therefore no wash-out period was required 8-Week retrospective and prospective trial
---------	--

Atorvastatin for lowering lipids (Review)

Plakogiannis 2002 (Continued)

Participants	64 men with hyperlipidaemia Exclusion criteria: newly diagnosed with a disease known to affect serum lipoproteins <u>Retrospective study morning dosing:</u> Baseline TC: 8.31 mmol/L (321 mg/dL) Baseline LDL-C: 4.87 mmol/L (188 mg/dL) Baseline HDL-C: 1.20 mmol/L (46 mg/dL) Baseline TG: 4.90 mmol/L (434 mg/dL) <u>Retrospective study evening dosing:</u> Baseline TC: 8.51 mmol/L (329 mg/dL) Baseline LDL-C: 5.04 mmol/L (195 mg/dL) Baseline HDL-C: 1.06 mmol/L (41 mg/dL) Baseline TG: 5.29 mmol/L (469 mg/dL) <u>Prospective study morning dosing:</u> Baseline TC: 8.22 mmol/L (318 mg/dL) Baseline LDL-C: 4.99 mmol/L (193 mg/dL) Baseline HDL-C: 1.09 mmol/L (42 mg/dL) Baseline TG: 4.69 mmol/L (415 mg/dL) <u>Prospective study evening dosing:</u> Baseline TC: 8.25 mmol/L (319 mg/dL) Baseline LDL-C: 4.96 mmol/L (192 mg/dL) Baseline HDL-C: 1.01 mmol/L (39 mg/dL) Baseline TG: 4.97 mmol/L (440 mg/dL)
--------------	--

Interventions	Atorvastatin 40 mg/d for 8 weeks retrospective study morning dosing Atorvastatin 40 mg/d for 8 weeks retrospective study evening dosing Atorvastatin 40 mg/d for 8 weeks prospective study morning dosing Atorvastatin 40 mg/d for 8 weeks prospective study evening dosing

Incomplete outcome data (attrition bias)	Low risk	Data on all participants were reported

Atorvastatin for lowering lipids (Review)

Plakogiannis 2002 (Continued)

All outcomes

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Pontrelli 2002

Methods	8-Week wash-out period 8-Week double-blind randomised placebo-controlled cross-over study	
Participants	20 men and women from Canada with type 2 diabetes and combined dyslipidaemia, mean age 59 years; TG > 2.5 mmol/L (221 mg/dL), HDL-C < 0.9 mmol/L (35 mg/dL) 10 participants received placebo, 10 received atorvastatin Exclusion criteria: statin hypersensitivity, use of lipid-altering drugs, women who are likely to become pregnant, type 1 diabetes, TSH > 5.5 mU/mL, renal and hepatic dysfunction, > 14 alcoholic drinks/wk Placebo baseline TC: 5.97 mmol/L (231 mg/dL) Placebo baseline LDL-C: 3.74 mmol/L (145 mg/dL) Placebo baseline HDL-C: 0.81 mmol/L (31 mg/dL) Placebo baseline TG: 4.95 mmol/L (438 mg/dL) Atorvastatin baseline TC: 6.60 mmol/L (255 mg/dL) Atorvastatin baseline LDL-C: 4.08 mmol/L (158 mg/dL) Atorvastatin baseline HDL-C: 0.89 mmol/L (34 mg/dL) Atorvastatin baseline TG: 3.44 mmol/L (305 mg/dL)	
Interventions	Placebo Atorvastatin 80 mg/d	
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	For the second period after the cross-over point, data were not analysed SDs were imputed WDAEs not reported	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Then randomized in a double-blind manner into 2 treatment groups"
Incomplete outcome data (attrition bias)	Low risk	Data on all participants were reported

Atorvastatin for lowering lipids (Review)

Pontrelli 2002 (Continued)

All outcomes

Selective reporting (reporting bias)	High risk	All lipid parameters were measured; no withdrawals due to adverse events were reported
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

PRAT 2013

Methods	4-Week wash-out period if participants were receiving lipid-lowering medication before enrolment 1-Year randomised open-label parallel-group study
Participants	202 men and women with dyslipidaemia and glucose intolerance, men ≥ 20 years old or post-menopausal women; LDL-C ≥ 140 mg/dL (3.62 mmol/L) HDL-C < 80 mg/dL (2.07 mmol/L), TG < 500 mg/dL (5.645 mmol/L) 101 participants received atorvastatin, 101 received pravastatin Exclusion criteria: poorly controlled diabetes mellitus, hepatic dysfunction, renal dysfunction, secondary hyperlipidaemia, steroid use, severe hypertension, cerebrovascular disease, MI, coronary artery reconstruction within 3 months, heart failure Class III or higher, statin hypersensitivity Atorvastatin baseline LDL-C: 4.161 mmol/L (161 mg/dL) Atorvastatin baseline HDL-C: 1.329 mmol/L (51 mg/dL)
Interventions	Atorvastatin 10 mg/d Pravastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum LDL-C and HDL-C
Notes	Pravastatin treatment arm was not analysed Efficacy was determined at 1 month only SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias)	Low risk	7/101 (6.9%) participants were not included in the efficacy analysis

Atorvastatin for lowering lipids (Review)

PRAT 2013 (Continued)

All outcomes

Selective reporting (reporting bias)	High risk	Total cholesterol and triglycerides were not included in the efficacy analysis
Other bias	Low risk	Industry did not fund this trial

Puato 2010

Methods	Participants were never treated with lipid-lowering agents, so no wash-out was required 12-Week randomised trial	
Participants	40 men and women with hypercholesterolaemia aged 78 to 79 years; TC 5.83 to 7.64 mmol/L Exclusion criteria: none Atorvastatin 10 mg/d baseline TC: 6.15 mmol/L (238 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.03 mmol/L (156 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.32 mmol/L (51 mg/dL) Atorvastatin 10 mg/d baseline TG: 1.72 mmol/L (152 mg/dL) Atorvastatin 80 mg/d baseline TC: 6.54 mmol/L (253 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 4.37 mmol/L (169 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.34 mmol/L (52 mg/dL) Atorvastatin 80 mg/d baseline TG: 1.85 mmol/L (164 mg/dL)	
Interventions	Atorvastatin 10 mg/d Atorvastatin 80 mg/d	
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	SDs were imputed

PULSAR 2006

Methods	6-Week wash-out period 6-Week multi-centre open-label randomised study
---------	---

Atorvastatin for lowering lipids (Review)

PULSAR 2006 (Continued)

Participants	<p>996 men and women with hypercholesterolaemia aged ≥ 18 years; LDL-C 130 to 220 mg/dL (3.4-5.7 mmol/L), TG < 400 mg/dL (4.5 mmol/L)</p> <p>505 participants received rosuvastatin, 491 received atorvastatin</p> <p>Exclusion criteria: unstable CVD, history of statin-induced myopathy, severe congestive heart failure, history of malignancy, homozygous FH, uncontrolled hypothyroidism, alcohol or drug abuse within 5 years, women who could become pregnant</p> <p>Atorvastatin baseline TC: 6.5 mmol/L (251 mg/dL)</p> <p>Atorvastatin baseline LDL-C: 4.3 mmol/L (166 mg/dL)</p> <p>Atorvastatin baseline HDL-C: 1.3 mmol/L (50.3 mg/dL)</p> <p>Atorvastatin baseline TG: 2.3 mmol/L (204 mg/dL)</p>
Interventions	<p>Atorvastatin 20 mg/d</p> <p>Rosuvastatin 10 mg/d</p>
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	<p>11/491 were not included in the efficacy analysis because of unmet criteria, adverse event, unwillingness to continue, loss to follow-up, other</p> <p>2.2% of participants were excluded from the efficacy analysis</p>
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Puurunen 2013

Methods	<p>Participants were not receiving any lipid-lowering agents; wash-out period was not required</p> <p>3-Month randomised double-blind placebo-controlled trial</p>
Participants	<p>38 women with polycystic ovary syndrome aged 29 to 50 years; BMI 19.9 to 53.8</p> <p>19 participants received atorvastatin, 19 received placebo</p>

Puurunen 2013 (Continued)

Exclusion criteria: type 2 diabetes mellitus; medication affecting glucose tolerance, lipid metabolism or steroid synthesis in the preceding 3 months; menopause, smoking, alcohol abuse, previous ovarian drilling, oophorectomy or hysterectomy, contraindications regarding the use of atorvastatin

Placebo baseline TC: 4.9 mmol/L (189 mg/dL)
 Placebo baseline LDL-C: 3.0 mmol/L (116 mg/dL)
 Placebo baseline HDL-C: 1.5 mmol/L (58 mg/dL)
 Placebo baseline TG: 1.0 mmol/L (89 mg/dL)

Atorvastatin 20 mg/d baseline TC: 5.2 mmol/L (201 mg/dL)
 Atorvastatin 20 mg/d baseline LDL-C: 3.3 mmol/L (128 mg/dL)
 Atorvastatin 20 mg/d baseline HDL-C: 1.52 mmol/L (58.8 mg/dL)
 Atorvastatin 20 mg/d baseline TG: 1.2 mmol/L (106 mg/dL)

Interventions	Atorvastatin 20 mg/d Placebo
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG WDAEs: One subject from the placebo group withdrew due to myalgia and one from the atorvastatin group due to arthralgia.
Notes	SDs were imputed.

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Computer-generated randomisation list in blocks of 6
Allocation concealment (selection bias)	Low risk	Medication was provided in closed envelopes that were sequentially numbered
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	High risk	6/19 (31.5%) participants given placebo and 4/19 (21%) given atorvastatin were not included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis; WDAEs were reported
Other bias	Low risk	Industry did not fund the trial

Qi 2013

Methods	Participants were not receiving any lipid-lowering agents; wash-out period was not required 1-Month before-and-after trial
Participants	306 men and women with high risk of coronary heart disease aged 30 to 70 years LDL-C \geq 2.6 mmol/L (101 mg/dL) with a history of CHD and diabetes mellitus or LDL-C \geq 4.1 mmol/L (159 mg/dL) with 2 or more risk factors

Atorvastatin for lowering lipids (Review)

Qi 2013 (Continued)

All participants received atorvastatin

Exclusion criteria: acute MI within 3 months, serious heart failure, autoimmunity disease, severe arrhythmia, cancer, hypothyroidism, nephrotic syndrome, serious trauma or major surgery within past 3 months, hepatic and renal dysfunction, drugs that interact with statins, lack of compliance with medication

Atorvastatin 20 mg/d baseline LDL-C: 3.72 mmol/L (144 mg/dL)

Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 1 month of serum LDL-C
Notes	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	High risk	LDL-C was included in the efficacy analysis
Other bias	Unclear risk	The source of funding was not reported

RADAR 2005

Methods	6-Week wash-out dietary run-in period 18-Week multi-centre open-label randomised parallel-group study Randomly assigned sequentially in blocks of 4
Participants	461 men and women from the Netherlands with CVD aged 40 to 80 years; HDL-C < 1.0 mmol/L (40 mg/dL), TG < 4.5 mmol/L (400 mg/dL) 231 participants received atorvastatin, 230 received rosuvastatin Exclusion criteria: use of lipid-altering drugs, statin hypersensitivity, pregnancy threat, active arterial disease within 2 months of trial, therapeutics intervention within 6 months, uncontrolled HTN, cancer, homozygous FH or type III hyperproteinaemia, alcohol or drug abuse, active liver disease, unexplained CK increase, serious medical or unstable psychological conditions Atorvastatin baseline TC: 5.7 mmol/L (220 mg/dL) Atorvastatin baseline LDL-C: 3.7 mmol/L (143 mg/dL) Atorvastatin baseline HDL-C: 0.8 mmol/L (31 mg/dL)

Atorvastatin for lowering lipids (Review)

RADAR 2005 (Continued)

Atorvastatin baseline TG: 2.7 mmol/L (239 mg/dL)

Interventions	Atorvastatin 20 mg/d for 0 to 6 weeks Atorvastatin 40 mg/d for 6 to 12 weeks Atorvastatin 80 mg/d for 12 to 18 weeks Rosuvastatin 10 mg/d for 0 to 6 weeks Rosuvastatin 20 mg/d for 6 to 12 weeks Rosuvastatin 40 mg/d for 12 to 18 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Raison 2002

Methods	1-Month wash-out period 12-Week single-centre double-blind randomised placebo-controlled study Evening doses
Participants	28 individuals from France, mean age 57 years (32-70), with HTN and hypercholesterolaemia were included in the study; 23 participants entered the treatment period; SBP 160 to 209 mmHg, DBP 95 to 109 mmHg, LDL plasma levels were chosen to be either >4.9 or >3.4 mmol/l, depending in each individual on the number of associated CV risk factors or the presence of personal history of coronary heart disease. Exclusion criteria: uncontrolled HTN, stroke, major cardiac or renal disease, arteritis, stage IV retinopathy, FH, hepatic dysfunction, diabetes, severe obesity, ECG faults or therapeutic contraindications to statins.

Atorvastatin for lowering lipids (Review)

Raison 2002 (Continued)

Placebo baseline TC: 7.11 mmol/L (275 mg/dL)
 Placebo baseline LDL-C: 5.18 mmol/L (200 mg/dL)
 Placebo baseline HDL-C: 1.31 mmol/L (51 mg/dL)

Atorvastatin baseline TC: 7.23 mmol/L (280 mg/dL)
 Atorvastatin baseline LDL-C: 4.97 mmol/L (192 mg/dL)
 Atorvastatin baseline HDL-C: 1.36 mmol/L (53 mg/dL)
 No baseline TG values were given

Interventions	Placebo Atorvastatin 10 mg/d
Outcomes	Percent change from baseline at 12 weeks of serum TC, LDL-C and HDL-C
Notes	WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind, two-parallel-group study"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TG data were not reported; WDAEs were not reported
Other bias	Low risk	The study appears to be free of other sources of bias

Reinares 2002

Methods	6-Week wash-out period 6-Week before-and-after study
Participants	25 men and women aged 43 to 73 years with CHD and hypercholesterolaemia; LDL-C \geq 130 mg/dL (3.36 mmol/L) Exclusion criteria: acute and chronic infections, cancer, inflammatory processes Baseline LDL-C: 4.25 mmol/L (164 mg/dL) Baseline HDL-C: 1.36 mmol/L (53 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum LDL-C and HDL-C

Atorvastatin for lowering lipids (Review)

Reinares 2002 (Continued)

SDs were imputed

Notes -

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TC and TG lipid data were not reported
Other bias	High risk	Pfizer partially funded the study; data may support bias for atorvastatin

Reiter 2005

Methods	<p>Participants were not receiving lipid-lowering therapy within the past year; therefore no baseline wash-out period was required</p> <p>6-Week prospective randomised trial</p>
Participants	<p>129 men and women aged 63.5 years</p> <p>Exclusion criteria: < 18 years old, pregnancy, psoriasis or eczema on either hand, use of topical medication within 24 hours of testing, chronic liver disease, inflammatory muscle disease or CK 3 × ULN, statin hypersensitivity, conditions leading to incomplete follow-up</p> <p>Baseline TC: 6.44 mmol/L (249 mg/dL) Baseline LDL-C: 4.01 mmol/L (155 mg/dL) Baseline HDL-C: 1.44 mmol/L (56 mg/dL) Baseline TG: 2.26 mmol/L (200 mg/dL)</p>
Interventions	<p>Atorvastatin 20 mg/d</p> <p>Simvastatin 40 mg/d</p>
Outcomes	Per cent change from baseline at 4 weeks of plasma TC, LDL-C, HDL-C and TG
Notes	<p>Atorvastatin group was analysed</p> <p>SDs were imputed</p>

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Saklamaz 2005

Methods	6-Week wash-out period 8-Week randomised study
Participants	21 men and women from Turkey with type IIa and IIb hyperlipidaemia aged 52 years; LDL-C > 160 mg/dL (4.14 mmol/L) 7 participants received atorvastatin, 7 received pravastatin, 7 received fenofibrate Exclusion criteria: endocrine problems, hepatic and renal dysfunction, BMI < 30, alcohol abuse Atorvastatin baseline TC: 6.78 mmol/L (262 mg/dL) Atorvastatin baseline LDL-C: 4.50 mmol/L (174 mg/dL) Atorvastatin baseline HDL-C: 1.32 mmol/L (51 mg/dL) Atorvastatin baseline TG: 2.13 mmol/L (189 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 8 weeks Pravastatin 20 mg/d for 0 to 8 weeks

Atorvastatin for lowering lipids (Review)

Saklamaz 2005 (Continued)

Fenofibrate 250 mg/d for 0 to 8 weeks

Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Sansanayudh 2010

Methods	Participants were not receiving lipid-altering agents, so wash-out was not required 8-Week randomised open-label parallel trial
Participants	50 participants > 18 years; LDL-C \geq 100 mg/dL Exclusion criteria: active liver disease, renal dysfunction, hepatic dysfunction, pregnancy, TG > 400 mg/dL, statin hypersensitivity Atorvastatin baseline TC: 6.60 mmol/L (255 mg/dL) Atorvastatin baseline LDL-C: 4.47 mmol/L (173 mg/dL) Atorvastatin baseline HDL-C: 1.39 mmol/L (54 mg/dL) Atorvastatin baseline TG: 1.60 mmol/L (142 mg/dL)
Interventions	Atorvastatin 10 mg/d Pitavastatin 1 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Atorvastatin for lowering lipids (Review)

Sansanayudh 2010 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not reported

Sardo 2002

Methods	4-Week to 6-week run-in period 12-week single-centre randomised placebo-controlled study Randomised 1:1 ratio (atorvastatin:placebo) Evening doses
Participants	40 men and women from Italy recruited from a medical centre, mean age 45 years with hypercholesterolaemia; TC > 7.0 mmol/L (271 mg/dL), LDL-C > 4.1 mmol/L (159 mg/dL), TG < 2.0 mmol/L (177 mg/dL) Exclusion criteria: arterial HTN, BMI > 27, thyroid disease, renal and hepatic dysfunction, smoking, diabetes, infection, inflammatory or autoimmune disease, arterial and cardiovascular disease Placebo baseline TC: 7.61 mmol/L (294 mg/dL) Placebo baseline LDL-C: 5.34 mmol/L (206 mg/dL) Placebo baseline HDL-C: 1.38 mmol/L (53 mg/dL) Placebo baseline TG: 1.14 mmol/L (101 mg/dL) Atorvastatin baseline TC: 7.52 mmol/L (291 mg/dL) Atorvastatin baseline LDL-C: 5.41 mmol/L (209 mg/dL) Atorvastatin baseline HDL-C: 1.35 mmol/L (52 mg/dL) Atorvastatin baseline TG: 1.17 mmol/L (104 mg/dL)
Interventions	Placebo Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Sardo 2002 (Continued)

WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Unclear risk	No information about blinding was provided to permit judgement of 'yes' or 'no'
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	Unclear risk	The source of funding was not provided

Sari 2007

Methods	No participants were receiving lipid-lowering agents; therefore no wash-out period was required 3-Month trial	
Participants	42 men and women from Turkey with hypercholesterolaemia; LDL-C > 160 mg/dL, aged 53 years, BMI 28.3 Exclusion criteria: kidney or liver disease, type 2 diabetes mellitus, hypothyroidism Baseline TC: 6.88 mmol/L (266 mg/dL) Baseline LDL-C: 4.81 mmol/L (186 mg/dL) Baseline HDL-C: 1.41 mmol/L (54.5 mg/dL) Baseline TG: 1.41 mmol/L (125 mg/dL)	
Interventions	Atorvastatin 20 mg/d	
Outcomes	Per cent change from baseline at 4 weeks of plasma TC, LDL-C, HDL-C and TG	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Sari 2007 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Sasaki 2008

Methods	2-Week to 4-week run-in period 52-Week multi-centre open-label randomised parallel-group study
Participants	85 men and women aged ≥ 20 years; LDL-C ≥ 140 mg/dL (3.62 mmol/L), HDL-C < 80 mg/dL (2.07 mmol/L), TG < 500 mg/dL (5.645 mmol/L), with glucose intolerance Exclusion criteria: contraindication to statin use, severe renal impairment or dysfunction, hypothyroidism, Cushing's syndrome, use of steroid hormones, severe HTN, cerebrovascular disease in the past 3 months, MI or coronary artery reconstruction in the past 3 months, Class III or higher heart failure, statin hypersensitivity, type 1 diabetes Atorvastatin baseline HDL-C: 1.33 mmol/L (51.4 mg/dL)
Interventions	Atorvastatin 10 mg/d Pitavastatin 2 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum HDL-C
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Atorvastatin for lowering lipids (Review)

Sasaki 2008 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	HDL-C data were reported at 8 weeks, LDL-C and TG data were reported at 12 months and TC data were not reported
Other bias	Low risk	The study appears to be free of other sources of bias

Sathyapalan 2009

Methods	Participants were not taking any medication that would affect blood lipid within the past 6 months; therefore no wash-out period was required 3-Month randomised double-blind placebo-controlled trial	
Participants	40 women from the UK with polycystic ovary syndrome, BMI 33 to 34 Exclusion criteria: individuals taking oral contraceptives and metformin within the past 6 months; those with non-classical 21 hydroxylase deficiency, hyperprolactinaemia, Cushing's disease; individuals with androgen-secreting tumours <u>Placebo:</u> Baseline TC: 4.5 mmol/L (174 mg/dL) Baseline LDL-C: 2.7 mmol/L (104 mg/dL) Baseline HDL-C: 1.1 mmol/L (42.5 mg/dL) Baseline TG: 1.39 mmol/L (123 mg/dL) <u>Atorvastatin:</u> Baseline TC: 4.6 mmol/L (178 mg/dL) Baseline LDL-C: 2.9 mmol/L (112 mg/dL) Baseline HDL-C: 1.07 mmol/L (41.4 mg/dL) Baseline TG: 1.34 mmol/L (119 mg/dL)	
Interventions	Placebo Atorvastatin 20 mg/d	
Outcomes	Per cent change from baseline at 4 weeks of plasma TC, LDL-C, HDL-C and TG	
Notes	WDAEs were not reported	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	Computer-generated randomisation list
Allocation concealment (selection bias)	Low risk	Drug labelling was done by personnel not involved in the trial
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind"

Atorvastatin for lowering lipids (Review)

Sathyapalan 2009 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	2/18 in the placebo group were not analysed because of non-compliance (11%) 1/19 in the atorvastatin group was not analysed because of non-compliance (5.2%)
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	High risk	Pfizer funded the trial; data results may be biased for atorvastatin

Save 2006

Methods	6-Week dietary stabilisation period 24-Week study
Participants	110 consecutive men and women aged 30 to 70 years with hyperlipidaemia and type 2 diabetes; LDL-C \geq 130 mg/dL (3.57 mmol/L), TG \leq 400 mg/dL (4.51 mmol/L) Exclusion criteria: primary hypothyroidism, nephrotic syndrome, type 1 diabetes, hepatic dysfunction, BMI $>$ 30 kg/m ² , uncontrolled HTN, MI, coronary angioplasty, unstable angina pectoris within 3 months before the study, active liver and renal disease Baseline TC: 6.52 mmol/L (252 mg/dL) Baseline LDL-C: 4.60 mmol/L (178 mg/dL) Baseline HDL-C: 1.11 mmol/L (43 mg/dL) Baseline TG: 1.78 mmol/L (158 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 6 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	7/110 were not included in the efficacy analysis because of loss to follow-up 6.4% of participants were excluded from the efficacy analysis

Save 2006 (Continued)

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Schneck 2003

Methods	6-Week dietary baseline stabilisation period 6-Week multi-centre randomised double-blind parallel-group trial
Participants	<p>374 men and women from Canada and the USA, mean age 56.5 years (> 17 years) with hypercholesterolaemia and without active arterial disease; LDL-C 4.14 to 6.46 mmol/L (160-250 mg/dL), TG < 4.52 mmol/L (400 mg/dL)</p> <p>209 participants received rosuvastatin, 165 received atorvastatin Exclusion criteria: women who may become pregnant, FH and type III hyperlipoproteinaemia</p> <p>Atorvastatin 10 mg/d baseline TC: 7.24 mmol/L (280 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.91 mmol/L (190 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.40 mmol/L (54 mg/dL) Atorvastatin 10 mg/d baseline TG: 2.03 mmol/L (180 mg/dL)</p> <p>Atorvastatin 20 mg/d baseline TC: 7.03 mmol/L (272 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.78 mmol/L (185 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.27 mmol/L (49 mg/dL) Atorvastatin 20 mg/d baseline TG: 2.13 mmol/L (189 mg/dL)</p> <p>Atorvastatin 40 mg/d baseline TC: 7.08 mmol/L (274 mg/dL) Atorvastatin 40 mg/d baseline LDL-C: 4.86 mmol/L (188 mg/dL) Atorvastatin 40 mg/d baseline HDL-C: 1.27 mmol/L (49 mg/dL) Atorvastatin 40 mg/d baseline TG: 2.05 mmol/L (182 mg/dL)</p> <p>Atorvastatin 80 mg/d baseline TC: 7.19 mmol/L (278 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 4.91 mmol/L (190 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.24 mmol/L (48 mg/dL) Atorvastatin 80 mg/d baseline TG: 2.18 mmol/L (193 mg/dL)</p>
Interventions	Atorvastatin 10 mg/d Atorvastatin 20 mg/d Atorvastatin 40 mg/d Atorvastatin 80 mg/d Rosuvastatin 5 mg/d Rosuvastatin 10 mg/d Rosuvastatin 20 mg/d Rosuvastatin 40 mg/d Rosuvastatin 80 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin groups were analysed

Schneck 2003 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin

Schrott 1998

Methods	6-Week placebo baseline period 6-Week multi-centre randomised parallel-group placebo-controlled trial
Participants	<p>65 men and women from the USA, mean age 58 (18-75) years; type IIa and IIb hypercholesterolaemia, LDL 4.1 to 6.5 mmol/L (159-251 mg/dL), TG ≤ 4.5 mmol/L (399 mg/dL) Exclusion criteria: women likely to become pregnant, hepatic dysfunction, renal dysfunction, uncontrolled HTN, diabetes, metabolic endocrine disease, alcohol consumption > 14-oz/wk equivalents, taking lipid-altering drugs</p> <p>Placebo baseline TC: 7.10 mmol/L (275 mg/dL) Placebo baseline LDL-C: 4.93 mmol/L (191 mg/dL) Placebo baseline HDL-C: 1.24 mmol/L (48 mg/dL) Placebo baseline TG: 2.09 mmol/L (185 mg/dL)</p> <p>Atorvastatin 10 mg/d baseline TC: 7.17 mmol/L (277 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.95 mmol/L (191 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.11 mmol/L (43 mg/dL) Atorvastatin 10 mg/d baseline TG: 2.38 mmol/L (211 mg/dL)</p> <p>Atorvastatin 20 mg/d baseline TC: 7.07 mmol/L (273 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.85 mmol/L (188 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.21 mmol/L (47 mg/dL) Atorvastatin 20 mg/d baseline TG: 2.07 mmol/L (183 mg/dL)</p> <p>Atorvastatin 40 mg/d baseline TC: 6.94 mmol/L (268 mg/dL) Atorvastatin 40 mg/d baseline LDL-C: 4.77 mmol/L (184 mg/dL) Atorvastatin 40 mg/d baseline HDL-C: 1.42 mmol/L (55 mg/dL) Atorvastatin 40 mg/d baseline TG: 1.60 mmol/L (142 mg/dL)</p> <p>Atorvastatin 60 mg/d baseline TC: 6.94 mmol/L (268 mg/dL) Atorvastatin 60 mg/d baseline LDL-C: 4.88 mmol/L (189 mg/dL) Atorvastatin 60 mg/d baseline HDL-C: 1.21 mmol/L (47 mg/dL) Atorvastatin 60 mg/d baseline TG: 1.85 mmol/L (164 mg/dL)</p>

Atorvastatin for lowering lipids (Review)

Schrott 1998 (Continued)

Atorvastatin 80 mg/d baseline TC: 7.40 mmol/L (286 mg/dL)
 Atorvastatin 80 mg/d baseline LDL-C: 5.08 mmol/L (196 mg/dL)
 Atorvastatin 80 mg/d baseline HDL-C: 1.42 mmol/L (55 mg/dL)
 Atorvastatin 80 mg/d baseline TG: 2.02 mmol/L (179 mg/dL)

Interventions	Placebo Atorvastatin 10 mg/d Atorvastatin 20 mg/d Atorvastatin 40 mg/d Atorvastatin 60 mg/d Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	High risk	Open trial
Blinding (performance bias and detection bias) All outcomes	High risk	Open trial
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Schwartz 2004

Methods	6-Week wash-out period 24-Week multi-centre randomised double-blind parallel-group study Randomisation was performed by balanced block scheme for each centre Evening dose
Participants	383 participants from USA with hypercholesterolaemia aged > 17 years; LDL-C 160 to 250 mg/dL (4.13-6.465 mmol/L), TG < 400 mg/dL (4.51 mmol/L) 128 participants received atorvastatin, 255 received rosuvastatin Exclusion criteria: pregnancy threat, taking lipid-altering drugs, active arterial disease, FH, uncontrolled HTN, hypothyroidism, diabetes, cancer history, renal and hepatic dysfunction

Schwartz 2004 (Continued)

Atorvastatin baseline TC: 7.11 mmol/L (275 mg/dL)
 Atorvastatin baseline LDL-C: 4.86 mmol/L (188 mg/dL)
 Atorvastatin baseline HDL-C: 1.22 mmol/L (47 mg/dL)
 Atorvastatin baseline TG: 2.28 mmol/L (202 mg/dL)

Interventions	Atorvastatin 10 mg/d for 0 to 12 weeks Atorvastatin conditional titration of 40 mg/d for 12 to 18 weeks Atorvastatin conditional titration of 80 mg/d for 18 to 24 weeks Rosuvastatin 5 mg/d for 0 to 12 weeks Rosuvastatin conditional titration of 20 mg/d for 12 to 18 weeks Rosuvastatin conditional titration of 80 mg/d for 18 to 24 weeks Rosuvastatin 10 mg/d for 0 to 12 weeks Rosuvastatin conditional titration of 40 mg/d for 12 to 18 weeks Rosuvastatin conditional titration of 80 mg/d for 18 to 24 weeks
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Shabana 2013

Methods	Participants were not receiving any lipid-lowering agents; wash-out period was not required 4-Week before-and-after study
Participants	50 men and women, mean age 55 years, with hypercholesterolaemia

Atorvastatin for lowering lipids (Review)

Shabana 2013 (Continued)

Exclusion criteria: pregnancy, familial hypercholesterolaemia, acute coronary syndrome, hepatic and renal disease, endocrinological disorder, cancer, medications known to affect lipid metabolism

Atorvastatin baseline TC: 5.612 mmol/L (217 mg/dL)
 Atorvastatin baseline LDL-C: 3.641 mmol/L (141 mg/dL)
 Atorvastatin baseline HDL-C: 1.019 mmol/L (39 mg/dL)
 Atorvastatin baseline TG: 2.212 mmol/L (196 mg/dL)

Interventions	Atorvastatin 40 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Shishehbor 2003

Methods	6-Week to 8-week dietary baseline stabilisation period 12-Week study
Participants	35 consecutive patients out of 200 individuals from 2 venues in Boston, MA, USA, ≥ 21 years of age; LDL-C ≥ 130 mg/dL (3.3 mmol/L); no clinical evidence of CAD, peripheral artery disease or diabetes mellitus; naive to statin therapy Exclusion criteria: liver disease, renal insufficiency, changes in medical therapy during the treatment period Baseline TC: 6.54 mmol/L (253 mg/dL) Baseline LDL-C: 4.37 mmol/L (169 mg/dL) Baseline HDL-C: 1.45 mmol/L (56 mg/dL) Baseline TG: 1.65 mmol/L (146 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Atorvastatin for lowering lipids (Review)

Shishehbor 2003 (Continued)

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

SHUKRA 2008

Methods	6-Week dietary run-in period 6-Week randomised double-blind comparative multi-centre parallel-group study
Participants	686 men and women aged ≥ 18 years; LDL-C 3.5 to 5.7 mmol/L (135-220 mg/dL), TG < 4.52 mmol/L (400 mg/dL), 55 participants were randomly assigned 25 participants received atorvastatin, 30 received rosuvastatin Atorvastatin baseline TC: 6.45 mmol/L (249 mg/dL) Atorvastatin baseline LDL-C: 4.43 mmol/L (171 mg/dL) Atorvastatin baseline HDL-C: 1.27 mmol/L (49 mg/dL) Atorvastatin baseline TG: 1.63 mmol/L (144 mg/dL)
Interventions	Atorvastatin 10 mg/d Rosuvastatin 5 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

SHUKRA 2008 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	3/25 were not included in the efficacy analysis because end-of-treatment data were missing 12% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Simons 1998

Methods	5-Week wash-out period 30-Week multi-centre open-label randomised study Randomly assigned two-thirds of participants received atorvastatin, one-third simvastatin with or without cholestyramine Atorvastatin dose was doubled every 6 weeks if LDL-C was ≥ 3.5 mmol/L
Participants	136 men and women from Australia and New Zealand, mean age 51 years, with primary hypercholesterolaemia; LDL ≥ 5.0 mmol/L (193 mg/dL), TG < 4.0 mmol/L (354 mg/dL) 92 participants received atorvastatin, 44 received simvastatin with or without resin Atorvastatin baseline TC: 11.00 mmol/L (425 mg/dL) Atorvastatin baseline LDL-C: 8.80 mmol/L (340 mg/dL) Atorvastatin baseline HDL-C: 1.10 mmol/L (42.54 mg/dL) Atorvastatin baseline TG: 2.50 mmol/L (221 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 6 weeks Atorvastatin conditional titration to 20 mg/d for 6 to 12 weeks Atorvastatin conditional titration to 40 mg/d for 12 to 18 weeks Atorvastatin conditional titration to 80 mg/d for 18 to 30 weeks Simvastatin 10 mg/d for 0 to 6 weeks Simvastatin with or without resin conditional titration to 20 mg/d for 6 to 12 weeks Simvastatin with or without resin conditional titration to 40 mg/d for 12 to 30 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
------	--------------------	-----------------------

Simons 1998 (Continued)

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Singh 2008

Methods	Participants received no lipid-altering drugs, so wash-out period was not required 12-Week double-blind randomised placebo-controlled trial
Participants	70 individuals with metabolic syndrome aged 50 to 51 years Exclusion criteria: smoking, diabetes, aspirin use > 81 mg/d, anti-inflammatory drugs, infection, cancer, recent major surgery, illness, liver, renal or uncompensated metabolic/hormonal disorders, high-sensitivity C-reactive protein > 10 mg/L Placebo baseline TC: 5.25 mmol/L (203 mg/dL) Placebo baseline LDL-C: 3.56 mmol/L (138 mg/dL) Placebo baseline HDL-C: 0.98 mmol/L (38 mg/dL) Atorvastatin 10 mg/d baseline TC: 5.35 mmol/L (207 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 3.52 mmol/L (136 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.03 mmol/L (40 mg/dL) Atorvastatin 80 mg/d baseline TC: 5.46 mmol/L (211 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 3.65 mmol/L (141 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 0.96 mmol/L (37 mg/dL)
Interventions	Placebo Atorvastatin 10 mg/d Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C; WDAEs were reported
Notes	SDs were imputed

Risk of bias
Atorvastatin for lowering lipids (Review)

Singh 2008 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Information about the sequence generation process was insufficient to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	Information about allocation concealment was insufficient to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TGs were not measured
Other bias	Low risk	The trial was not funded by pharmaceutical companies

Sinski 2009

Methods	No participant was receiving lipid-altering agents, so wash-out was not required 8-Week before-and-after trial	
Participants	10 men aged 31 to 55 years with hypercholesterolaemia and with mild to moderate essential HTN Exclusion criteria: secondary forms of HTN, diabetes Atorvastatin 20 mg/d baseline TC: 6.53 mmol/L (252.5 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.16 mmol/L (161 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.20 mmol/L (46 mg/dL)	
Interventions	Atorvastatin 20 mg/d	
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C and HDL-C	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Atorvastatin for lowering lipids (Review)

Sinski 2009 (Continued)

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TGs were not measured
Other bias	Unclear risk	The source of funding was not reported

Sirtori 2005

Methods	4-Week wash-out period 12-Week multi-centre double-blind double-dummy parallel randomised study
Participants	86 men and women from Italy with familial combined hyperlipidaemia aged 55 years; LDL-C > 160 mg/dL (4.14 mmol/L), TG > 200 mg/dL (2.26 mmol/L) 45 participants received atorvastatin, 41 received pravastatin Exclusion criteria: none Atorvastatin baseline TC: 7.91 mmol/L (306 mg/dL) Atorvastatin baseline LDL-C: 5.45 mmol/L (211 mg/dL) Atorvastatin baseline HDL-C: 1.18 mmol/L (45.6 mg/dL) Atorvastatin baseline TG: 3.26 mmol/L (289 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 12 weeks Pravastatin 20 mg/d for 0 to 12 weeks
Outcomes	Per cent change from baseline at 6 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Atorvastatin 20 mg/d: 1/156 was not included in the efficacy analysis Atorvastatin 40 mg/d: 4/160 were not included in the efficacy analysis Atorvastatin 80 mg/d: 2/167 were not included in the efficacy analysis 1.4% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	AstraZeneca funded the study; data may support bias against atorvastatin

Stojakovic 2007

Methods	<p>4-Week placebo run-in period</p> <p>20-Week prospective single-centre single-blinded study</p>
Participants	<p>15 women with primary biliary cirrhosis and incomplete biochemical response to ursodeoxycholic acid</p> <p>Exclusion criteria: primary biliary cirrhosis stage III to IV at the time of liver biopsy, > 75 years old, de-compensated liver disease, AST or ALT > 3 × ULN, CPK > 5 × ULN; CPK > 5 × ULN or 3 × ULN with muscle pain, tenderness or weakness; severe renal dysfunction, nephrotic syndrome, statin hypersensitivity, pregnancy or breastfeeding, premenopausal women without safe contraception</p> <p>Baseline TC: 6.13 mmol/L (237 mg/dL) Baseline LDL-C: 4.65 mmol/L (180 mg/dL) Baseline HDL-C: 1.78 mmol/L (69 mg/dL) Baseline TG: 1.20 mmol/L (106 mg/dL)</p>
Interventions	<p>Atorvastatin 10 mg/d for 0 to 4 weeks</p> <p>Atorvastatin 20 mg/d for 4 to 8 weeks</p> <p>Atorvastatin 40 mg/d for 8 to 12 weeks</p> <p>Atorvastatin discontinuation for 12 to 20 weeks</p>
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	<p>First atorvastatin dose was analysed</p> <p>SDs were imputed</p>

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	<p>3/18 were not included in the efficacy analysis for personal reasons and because of gastrointestinal side effects during the placebo run-in period</p> <p>16.7% of participants were excluded from the efficacy analysis</p> <p>Risk of bias is high</p>
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

SToP AF 2011

Methods	<p>Participants had a normal lipid profile, so no wash-out was required</p> <p>4-Week double-blind randomised placebo-controlled trial</p>
Participants	<p>64 men and women with atrial fibrillation</p> <p>Exclusion criteria: aged < 18 years, paroxysmal atrial fibrillation, haemodynamic instability, atrial fibrillation ablation within 6 months of study, anticoagulation contraindication, severe valvular heart disease, unstable angina, implantable defibrillator, Class IV heart failure, hyperthyroidism, uncontrolled HTN, significant CAD, illicit drug use, alcoholism, atorvastatin hypersensitivity, pregnancy threat, nursing mothers, liver and renal dysfunction, inflammatory muscle disease</p> <p>Placebo baseline TC: 4.22 mmol/L (163 mg/dL)</p> <p>Atorvastatin baseline TC: 4.74 mmol/L (183 mg/dL)</p>
Interventions	<p>Placebo</p> <p>Atorvastatin 80 mg/d</p>
Outcomes	Per cent change from baseline at 4 weeks of serum TC; WDAEs were reported
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Information about sequence generation was insufficient to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Low risk	Active drug and placebo were administered in identical appearing tablets
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	LDL-C, HDL-C and TG data were not reported
Other bias	High risk	Pfizer funded the trial

STRENGTH 2008

Methods	<p>6-Week wash-out dietary baseline period</p> <p>8-Week before-and-after trial</p>
Participants	<p>168 men and women aged 18 to 75 years with type IIa or IIb hypercholesterolaemia</p> <p>Exclusion criteria: LDL-C > 240 mg/dL, TG > 400 mg/dL, history of MI within 6 months, unstable angina, stroke, transient ischaemic attack or coronary revascularisation within the past year</p>

STRENGTH 2008 (Continued)

Baseline LDL-C 4.42 mmol/L (171 mg/dL)

Interventions	Atorvastatin 10 mg/d Simvastatin 20 mg/d Pravastatin 10 mg/d
Outcomes	Per cent change from baseline at 8 weeks of serum LDL-C
Notes	Atorvastatin group was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TC, HDL-C and TG data were not analysed
Other bias	Unclear risk	Genaissance Pharmaceuticals funded the trial

Stulc 2008

Methods	4-Week dietary wash-out period 12-Week before-and-after trial
Participants	27 individuals with primary hypercholesterolaemia aged > 18 years; TC > 7.0 mmol/L (271 mg/dL) Exclusion criteria: hypertriglyceridaemia, secondary hyperlipidaemia, manifest vascular disease, diabetes, malignancy, other major disease Baseline TC: 8.59 mmol/L (332 mg/dL) Baseline LDL-C: 6.20 mmol/L (240 mg/dL) Baseline HDL-C: 1.63 mmol/L (63 mg/dL) Baseline TG: 1.67 mmol/L (148 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG

Atorvastatin for lowering lipids (Review)

Stulc 2008 (Continued)

Notes SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Suleiman 2012

Methods	Participants were not receiving any lipid-lowering agents; wash-out period was not required 3-Month randomised double-blind placebo-controlled trial
Participants	125 men and women with atrial fibrillation \geq 18 years old 62 participants received atorvastatin; 63 received placebo Exclusion criteria: cancer, inflammatory disease, surgery, trauma, MI in the previous month, contraindication to statin therapy, elevated liver enzymes $> 2 \times$ ULN Placebo baseline TC: 4.888 mmol/L (189 mg/dL) Placebo baseline LDL-C: 3.05 mmol/L (118 mg/dL) Placebo baseline HDL-C: 1.24 mmol/L (48 mg/dL) Atorvastatin 80 mg/day baseline TC: 4.78 mmol/L (185 mg/dL) Atorvastatin 80 mg/day baseline LDL-C: 2.896 mmol/L (112 mg/dL) Atorvastatin 80 mg/day baseline HDL-C: 1.215 mmol/L (47 mg/dL)
Interventions	Placebo Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C and HDL-C
Notes	SDs were imputed

Risk of bias
Atorvastatin for lowering lipids (Review)

Suleiman 2012 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	Double-blind
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	High risk	Triglycerides were not included in the efficacy analysis; no WDAEs were reported
Other bias	High risk	Pfizer funded the trial; efficacy data could be biased favourably towards atorvastatin

SUPREME 2009

Methods	4-Week wash-out period 12-Week before-and-after trial
Participants	80 men and women with mixed dyslipidaemia or hyperlipidaemia aged ≥ 21 years; LDL-C ≥ 130 and < 250 mg/dL, HDL-C < 40 mg/dL for men or < 50 mg/dL for women, TG < 350 mg/dL Exclusion criteria: niacin or statin intolerance, excessive alcohol consumption or substance abuse, drugs that interfere with lipid metabolism, psychiatric disease, unstable endocrine disease, uncontrolled hypothyroidism, HTN or cardiac arrhythmia, peripheral artery disease occlusion, Class III or IV congestive heart failure, unstable angina, uncontrolled diabetes, heart surgery, stomach or liver disease, pancreatitis, cancer Baseline LDL-C: 4.32 mmol/L (167 mg/dL) Baseline HDL-C: 0.97 mmol/L (37.5 mg/dL)
Interventions	Atorvastatin 40 mg/d Niacin/simvastatin 1000/40 mg/d titrated to 2000/40 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum LDL-C and HDL-C
Notes	Atorvastatin group was analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
-------------	---------------------------	------------------------------

SUPREME 2009 (Continued)

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 40 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	1.2% of participants were not analysed
Selective reporting (reporting bias)	High risk	TC and TG data were not analysed
Other bias	High risk	Abbott funded the study

Szapary 2004

Methods	Participants did not receive lipid-lowering drug treatment before the study; therefore a wash-out period was not required 12-Week before-and-after trial
Participants	27 men and women from Hungary with cerebrovascular disease and hyperlipidaemia, mean age 61 years; TC > 5.2 mmol/L, LDL-C > 3.4 mmol/L Exclusion criteria: none reported Baseline TC: 7.03 mmol/L (272 mg/dL) Baseline LDL-C: 4.32 mmol/L (167 mg/dL) Baseline HDL-C: 1.55 mmol/L (60 mg/dL) Baseline TG: 2.32 mmol/L (205 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of plasma TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

Szapary 2004 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Tagle 2000

Methods	4-Week wash-out 8-Week single-centre before-and-after study Evening dose
Participants	40 men and women from Ecuador aged 18 to 80 years with hypercholesterolaemia; LDL-C > 100 mg/dL (2.59 mmol/L) Exclusion criteria: hypothyroidism, type 1 and 2 diabetes, hepatic dysfunction, BMI > 34, uncontrolled HTN, MI, unstable CVD, statin hypersensitivity, lipid-altering drugs Baseline TC: 6.97 mmol/L (270 mg/dL) Baseline LDL: 4.90 mmol/L (189 mg/dL) Baseline HDL: 1.00 mmol/L (38.67 mg/dL) Baseline TG: 2.08 mmol/L (184 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 to 8 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported

Table 2000 (Continued)

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Takebayashi 2005

Methods	No individuals were being treated with anti-lipidaemic drugs; therefore no wash-out period was required 3-Month before-and-after trial	
Participants	30 individuals with type 2 diabetes with hyperlipidaemia from Japan aged 61 years; TC > 220 mg/dL, TG > 150 mg/dL Exclusion criteria: liver or renal dysfunction, infectious or autoimmune disease Baseline TC: 6.74 mmol/L (261 mg/dL) Baseline LDL-C: 4.41 mmol/L (171 mg/dL) Baseline HDL-C: 1.48 mmol/L (57 mg/dL) Baseline TG: 1.41 mmol/L (125 mg/dL)	
Interventions	Atorvastatin 10 mg/d	
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG	
Notes	SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	High risk	3/20 in atorvastatin group were not analysed for efficacy because of non-compliance 15% of participants were not included in the efficacy analysis Risk of bias is high
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Tan 2002

Methods	8-Week wash-out period 6-Month single-centre double-blind randomised placebo-controlled study
Participants	80 men and women from Hong Kong with NIDDM, mean age 55 years; LDL-C > 3.4 mmol/L (131 mg/dL), TG < 4.0 mmol/L (355 mg/dL) Exclusion criteria: current use of lipid-modifying agents, secondary hyperlipidaemia, renal and hepatic dysfunction, major cardiovascular event within 6 months Placebo baseline TC: 6.12 mmol/L (237 mg/dL) Placebo baseline LDL-C: 4.29 mmol/L (166 mg/dL) Placebo baseline HDL-C: 1.12 mmol/L (43 mg/dL) Atorvastatin baseline TC: 6.35 mmol/L (246 mg/dL) Atorvastatin baseline LDL-C: 4.45 mmol/L (172 mg/dL) Atorvastatin baseline HDL-C: 1.19 mmol/L (46 mg/dL)
Interventions	Placebo for 0 to 3 months Atorvastatin 10 mg/d for 0 to 3 months Placebo for 3 to 6 months Atorvastatin 20 mg/d for 3 to 6 months
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First placebo and atorvastatin dose groups were analysed SDs were imputed WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"Double-blind, placebo-controlled study"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	TGs were not analysed because data were expressed as median values; WDAEs were not reported
Other bias	High risk	This study was partially funded by Pfizer Inc; data may support bias for atorvastatin

Tanaka 2001

Methods	<p>4-Week wash-out period</p> <p>12-Week multi-centre double-blind randomised parallel-group placebo-controlled study</p> <p>Randomisation by permuted block design of block size 6 (3: atorvastatin, 3: placebo) at each institution</p>
Participants	<p>55 men and women from Japan with NIDDM and hypercholesterolaemia aged 20 to 70 years; TC \geq 5.7 mmol/L (220 mg/dL)</p> <p>Stable glycaemic controls were recruited to participate in the trial. 4 individuals were ineligible and 1 withdrew consent during the observation period. Of the remaining 50 individuals, 10 were excluded in a blinded review because they fulfilled exclusion criteria. 40 were defined as the full analysis set</p> <p>20 participants received placebo, 20 received atorvastatin</p> <p>Exclusion criteria: aged $<$ 20 or $>$ 71 years, women taking hormone replacement therapy, HbA1c value \geq 10%, TG \geq 4.5 mmol/L (400 mg/dL), hepatic and renal dysfunction, MI or cerebrovascular disease within 3 months, secondary hyperlipidaemia, alcohol abuse</p> <p>Placebo baseline TC: 6.80 mmol/L (263 mg/dL) Placebo baseline LDL-C: 4.5 mmol/L (174 mg/dL) Placebo baseline HDL-C: 1.4 mmol/L (54 mg/dL) Placebo baseline TG: 1.9 mmol/L (168 mg/dL)</p> <p>Atorvastatin baseline TC: 6.80 mmol/L (263 mg/dL) Atorvastatin baseline LDL-C: 4.4 mmol/L (170 mg/dL) Atorvastatin baseline HDL-C: 1.5 mmol/L (58 mg/dL) Atorvastatin baseline TG: 2.1 mmol/L (186 mg/dL)</p>
Interventions	<p>Placebo</p> <p>Atorvastatin 10 mg/d</p>
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	<p>SDs were imputed</p> <p>WDAEs were reported</p>

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"A double-blind, placebo-controlled, parallel-group study was performed"
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	<p>12-Week placebo: 2/20 were not included in the efficacy analysis; 1 person died during treatment: "1 in whose case the antidiabetic therapy was changed"</p> <p>12-Week atorvastatin: 2/20 were not included in the efficacy analysis: "2 were lost to follow-up"</p> <p>10% of participants were excluded from the efficacy analysis</p>

Tanaka 2001 (Continued)

Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

TARGET TANGIBLE 1999

Methods	6-Week wash-out period 14-Week open-label randomised parallel-group study Evening dose
Participants	4097 men and women from Germany with CHD aged 35 to 75 years; LDL-C > 130 mg/dL (3.36 mmol/L), 3748 of 4097 were enrolled in the diet phase A total of 2856 participants met the lipid criteria at the end of the diet phase and were randomly assigned 1897 participants received atorvastatin, 959 received simvastatin Exclusion criteria: statin hypersensitivity, liver disease, muscle disease, active arterial disease, FH, TG > 1000 mg/dL (11.28 mmol/L), heart failure stage III or IV, uncontrolled HTN, cancer, surgery or severe medical disease, nephrotic syndrome, endocrine disorder, LDL apheresis, drug or alcohol abuse, pregnancy threat, participation in another study, lack of consent Atorvastatin baseline TC, HDL-C and TG were not reported Atorvastatin baseline LDL-C: 4.86 mmol/L (188 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 5 weeks Atorvastatin conditional titration 20 mg/d for 5 to 10 weeks Atorvastatin conditional titration 40 mg/d for 10 to 14 weeks Simvastatin 10 mg/d for 0 to 5 weeks Simvastatin conditional titration 20 mg/d for 5 to 10 weeks Simvastatin conditional titration 40 mg/d for 10 to 14 weeks
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C and TG
Notes	First atorvastatin dose was analysed SD was imputed for LDL-C only

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable

TARGET TANGIBLE 1999 (Continued)

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Other bias	Unclear risk	No source of funding was provided

Atorvastatin for lowering lipids (Review)

Tomas 2004

Methods	Participants had not received hypolipidaemic treatment in the 3 months before inclusion in the study 3-Month before-and-after study
Participants	21 men and women with dyslipidaemia aged 65 years; TC > 250 mg/dL (6.465 mmol/L), LDL-C > 160 mg/dL (4.14 mmol/L) Baseline TC: 6.50 mmol/L (251 mg/dL) Baseline LDL-C: 4.44 mmol/L (172 mg/dL) Baseline HDL-C: 1.36 mmol/L (53 mg/dL) Baseline TG: 1.45 mmol/L (128 mg/dL)
Interventions	Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 20 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

Tousoulis 2005

Methods	No use of lipid-lowering agents during the past 6 months 4-Week randomised trial
Participants	26 participants with ischaemic heart failure Exclusion criteria: left ventricular hypertrophy, acute and chronic inflammatory disease involving organs other than the heart and other cardiac disease, smoking, fasting cholesterol levels > 210 mg/dL (5.43 mmol/L), use of antioxidant vitamins or other dietary supplements, patients who required medication changes

Tousoulis 2005 (Continued)

Atorvastatin 10 mg/d baseline TC: 4.78 mmol/L (185 mg/dL)

Atorvastatin 10 mg/d baseline HDL-C: 0.87 mmol/L (34 mg/dL)

Atorvastatin 10 mg/d baseline TG: 1.61 mmol/L (143 mg/dL)

Atorvastatin 10 mg/d + vitamin E 400 IU/d baseline TC: 4.89 mmol/L (189 mg/dL)

Atorvastatin 10 mg/d + vitamin E 400 IU/d baseline HDL-C: 0.85 mmol/L (33 mg/dL)

Atorvastatin 10 mg/d + vitamin E 400 IU/d baseline TG: 1.72 mmol/L (152 mg/dL)

Interventions	Atorvastatin 10 mg/d for 0 to 3 months Atorvastatin 10 mg/d + vitamin E 400 IU/d for 0 to 3 months
Outcomes	Per cent change from baseline at 4 weeks of serum TC, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 10 mg/d + vitamin E; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 10 mg/d + vitamin E; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d and atorvastatin 10 mg/d + vitamin E; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	LDL-C data were not reported
Other bias	Unclear risk	No source of funding was provided

Tousoulis 2006

Methods	No use of lipid-lowering agents during the past 6 months 6-Week before-and-after trial
Participants	46 participants with unstable angina 22 participants received atorvastatin, 24 received no statin Exclusion criteria: left ventricular hypertrophy, acute and chronic inflammatory disease involving organs other than the heart and other cardiac disease, heart failure, overt atherosclerotic peripheral vascular disease, fasting cholesterol levels > 210 mg/dL (5.43 mmol/L) Atorvastatin baseline TC: 5.09 mmol/L (197 mg/dL) Atorvastatin baseline HDL-C: 0.86 mmol/L (33 mg/dL)

Tousoulis 2006 (Continued)

Atorvastatin baseline TG: 1.26 mmol/L (112 mg/dL)

Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, HDL-C and TG
Notes	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Other bias	Low risk	Industry did not fund the trial

Vansant 2001

Methods	4-Week wash-out period 4-Week single-centre double-blind randomised placebo-controlled study Randomly assigned placebo:atorvastatin ratio 1:2 Evening doses
Participants	22 obese women from Belgium selected from the obesity outpatient clinic homozygous for apo E3 aged 32 to 48 years; euthyroid, non-diabetic, normal kidney function, not taking lipid-altering drugs Placebo baseline TC: 5.12 mmol/L (198 mg/dL) Placebo baseline LDL-C: 3.02 mmol/L (117 mg/dL) Placebo baseline HDL-C: 1.29 mmol/L (50 mg/dL) Placebo baseline TG: 1.88 mmol/L (167 mg/dL) Atorvastatin baseline TC: 5.53 mmol/L (214 mg/dL) Atorvastatin baseline LDL-C: 3.62 mmol/L (140 mg/dL) Atorvastatin baseline HDL-C: 1.47 mmol/L (57 mg/dL) Atorvastatin baseline TG: 1.35 mmol/L (120 mg/dL)
Interventions	Placebo Atorvastatin 20 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"As a double-blind"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported

Vansant 2001 (Continued)

Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	Unclear risk	No source of funding was provided

VISION 2013

Methods	No participant received lipid-altering agents; no wash-out period was required 12-Week randomised trial	
Participants	42 men and women with hyperlipidaemia aged 45 to 75 years 21 participants received pitavastatin; 21 received atorvastatin Exclusion criteria: age < 20 years, premenopausal females, diabetes, CVD, liver and renal dysfunction, endocrine disease, administration of agents that could affect lipid metabolism and oxidation Atorvastatin baseline TC: 6.96 mmol/L (269 mg/dL) Atorvastatin baseline LDL-C: 4.73 mmol/L (183 mg/dL) Atorvastatin baseline HDL-C: 1.42 mmol/L (55 mg/dL) Atorvastatin baseline TG: 1.49 mmol/L (132 mg/dL)	
Interventions	Pitavastatin 2 mg/d Atorvastatin 10 mg/d	
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	Pitavastatin group was not included in the efficacy analysis	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All participants were included in the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were included in the efficacy analysis
Other bias	Low risk	Industry did not fund the trial

VY TAL 2006

Methods	3-Week to 5-week wash-out period 6-Week multi-centre randomised double-blind study Randomly assigned using an interactive voice response system
Participants	1229 men and women from the USA with NIDDM and hypercholesterolaemia aged 18 to 80 years; LDL-C > 100 mg/dL (2.59 mmol/L), TG < 400 mg/dL (4.51 mmol/L) 735 participants received atorvastatin, 494 received Vytorin Exclusion criteria: none Atorvastatin 10 mg/d baseline TC: 5.96 mmol/L (230 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 3.75 mmol/L (145 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.16 mmol/L (45 mg/dL) Atorvastatin 20 mg/d baseline TC: 5.97 mmol/L (231 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 3.79 mmol/L (147 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.20 mmol/L (46 mg/dL) Atorvastatin 40 mg/d baseline TC: 5.95 mmol/L (230 mg/dL) Atorvastatin 40 mg/d baseline LDL-C: 3.77 mmol/L (146 mg/dL) Atorvastatin 40 mg/d baseline HDL-C: 1.19 mmol/L (46 mg/dL)
Interventions	Atorvastatin 10 mg/d Atorvastatin 20 mg/d Atorvastatin 40 mg/d Vytorin 10 mg/d Vytorin 20 mg/d Vytorin 40 mg/d
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C and HDL-C
Notes	Atorvastatin groups were analysed SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d and atorvastatin 40 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d and atorvastatin 40 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d and atorvastatin 40 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All atorvastatin doses: 17/735 were not included in the efficacy analysis because of protocol deviation, withdrawal of consent, adverse event, relocation

Atorvastatin for lowering lipids (Review)

VYTA 2006 (Continued)

Comment: Number is low; 2.3% of participants were excluded from the efficacy analysis

Selective reporting (reporting bias)	High risk	TGs were not analysed because data were reported as median values
Other bias	High risk	Merck funded the study; data may support bias against atorvastatin

VYTELD 2010

Methods	6-Week to 8-week wash-out period and 3-week single-blind placebo run-in period 12-Week before-and-after study	
Participants	773 men and women aged ≥ 65 years with hyperlipidaemia; LDL-C ≥ 130 mg/dL (3.36 mmol/L), TG ≤ 350 mg/dL (3.96 mmol/L) Exclusion criteria: congestive heart failure, unstable angina pectoris, MI, coronary bypass surgery, angioplasty or uncontrolled peripheral artery disease, ≤ 3 months of placebo run-in, uncontrolled HTN, intestinal or renal disease, uncontrolled endocrine or metabolic disease, treatment with prohibited concomitant therapy, systemic corticosteroids, anti-obesity medication with < 3 months' stabilisation Atorvastatin 10 mg/d baseline TC: 6.54 mmol/L (253 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.32 mmol/L (167 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.37 mmol/L (53 mg/dL) Atorvastatin 20 mg/d baseline TC: 6.46 mmol/L (250 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.27 mmol/L (165 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.40 mmol/L (54 mg/dL) Atorvastatin 40 mg/d baseline TC: 6.54 mmol/L (253 mg/dL) Atorvastatin 40 mg/d baseline LDL-C: 4.34 mmol/L (168 mg/dL) Atorvastatin 40 mg/d baseline HDL-C: 1.37 mmol/L (53 mg/dL)	
Interventions	Atorvastatin 10 mg/d Atorvastatin 20 mg/d Atorvastatin 40 mg/d Ezetimibe/simvastatin 10 mg/20 mg/d Ezetimibe/simvastatin 10 mg/40 mg/d	
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C and HDL-C	
Notes	Atorvastatin groups were analysed TGs were not analysed because they were expressed as median values SDs were imputed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d and atorvastatin 40 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

VYTELD 2010 (Continued)

Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d and atorvastatin 40 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d and atorvastatin 40 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Only 7% of participants receiving atorvastatin were not included in the analysis
Selective reporting (reporting bias)	High risk	TGs were not analysed because they were median values
Other bias	High risk	Merck funded the study

VYVA 2005

Methods	4-Week wash-out period 6-Week multi-centre randomised double-blind parallel-group study Participants were centrally randomly assigned with use of an interactive voice response system and were stratified according to visit 2 to achieve balance among treatment groups
Participants	1902 men and women from the USA with hypercholesterolaemia aged 18 to 79 years; LDL-C > 130 mg/dL (3.36 mmol/L), TG < 350 mg/dL (3.95 mmol/L) 951 participants received atorvastatin, 951 received Vytorin Exclusion criteria: none Atorvastatin 10 mg/d baseline TC: 6.76 mmol/L (261 mg/dL) Atorvastatin 10 mg/d baseline LDL-C: 4.53 mmol/L (175 mg/dL) Atorvastatin 10 mg/d baseline HDL-C: 1.24 mmol/L (48 mg/dL) Atorvastatin 20 mg/d baseline TC: 6.86 mmol/L (265 mg/dL) Atorvastatin 20 mg/d baseline LDL-C: 4.61 mmol/L (178 mg/dL) Atorvastatin 20 mg/d baseline HDL-C: 1.26 mmol/L (49 mg/dL) Atorvastatin 40 mg/d baseline TC: 6.85 mmol/L (265 mg/dL) Atorvastatin 40 mg/d baseline LDL-C: 4.65 mmol/L (180 mg/dL) Atorvastatin 40 mg/d baseline HDL-C: 1.30 mmol/L (50 mg/dL) Atorvastatin 80 mg/d baseline TC: 6.89 mmol/L (266 mg/dL) Atorvastatin 80 mg/d baseline LDL-C: 4.72 mmol/L (183 mg/dL) Atorvastatin 80 mg/d baseline HDL-C: 1.24 mmol/L (48 mg/dL)
Interventions	Atorvastatin 10 mg/d Atorvastatin 20 mg/d Atorvastatin 40 mg/d Atorvastatin 80 mg/d Vytorin 10 mg/d Vytorin 20 mg/d Vytorin 40 mg/d

Atorvastatin for lowering lipids (Review)

VYVA 2005 (Continued)

Vytorin 80 mg/d

Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Atorvastatin groups were analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d, atorvastatin 20 mg/d, atorvastatin 40 mg/d and atorvastatin 80 mg/d; interventions were analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	All atorvastatin groups: 24/951 were not included in the efficacy analysis because of discontinuation for adverse events, withdrawal of consent, loss to follow-up, protocol deviation, other reasons Comment: 2.5% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	High risk	TG data were not analysed in our review because data were expressed as median values
Other bias	High risk	Merck funded the study; data may result in bias against atorvastatin

Wang 2001

Methods	6-Week wash-out baseline dietary stabilisation period 8-Week double-blind randomised placebo-controlled study
Participants	54 men and women outpatients from Taiwan with elevated LDL-C, mean age 66 years (18-80); LDL-C 4.2 to 6.5 mmol/L (162-251 mg/dL), TG < 4.5 mmol/L (399 mg/dL) Exclusion criteria: women likely to become pregnant, hypothyroidism, liver and renal dysfunction, alcohol abuse, unstable CVD, dementia, statin hypersensitivity, cancer, alcohol abuse, chronic lung disease, taking lipid-altering medications Placebo baseline TC: 6.73 mmol/L (260 mg/dL) Placebo baseline LDL-C: 4.84 mmol/L (187 mg/dL) Placebo baseline HDL-C: 1.17 mmol/L (45 mg/dL) Placebo baseline TG: 1.56 mmol/L (138 mg/dL) Atorvastatin baseline TC: 6.90 mmol/L (267 mg/dL) Atorvastatin baseline LDL-C: 4.98 mmol/L (193 mg/dL) Atorvastatin baseline HDL-C: 1.17 mmol/L (45 mg/dL) Atorvastatin baseline TG: 1.63 mmol/L (144 mg/dL)
Interventions	Placebo

Atorvastatin for lowering lipids (Review)

Wang 2001 (Continued)

Atorvastatin 10 mg/d

Outcomes Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG

Notes WDAEs were not reported

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	No information about sequence generation was provided to permit judgement of 'yes' or 'no'
Allocation concealment (selection bias)	Unclear risk	No information about allocation concealment was provided to permit judgement of 'yes' or 'no'
Blinding (performance bias and detection bias) All outcomes	Low risk	"This study was a randomized, double-blind, placebo-controlled, 8-week study"
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	High risk	All lipid parameters were measured; WDAEs were not reported
Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin

Wang 2012

Methods	1-Month baseline wash-out dietary stabilisation period 12-Week randomised trial
Participants	90 men and women with mild to moderate renal dysfunction aged 26 to 81 years; TC \geq 5.18 mmol/L (200 mg/dL), LDL-C \geq 3.37 mmol/L (130 mg/dL), TG \geq 1.7 mmol/L (151 mg/dL) 30 participants received atorvastatin, 60 received rosuvastatin Exclusion criteria: calcium allergy, familial hypercholesterolaemia, thyroid dysfunction, acute or chronic liver disease or liver dysfunction, use of lipid-altering agents within 2 months of the study, severe infection, surgery, trauma within 1 month of the study Atorvastatin baseline TC: 6.17 mmol/L (239 mg/dL) Atorvastatin baseline LDL-C: 3.78 mmol/L (146 mg/dL) Atorvastatin baseline HDL-C: 0.89 mmol/L (34 mg/dL) Atorvastatin baseline TG: 2.21 mmol/L (196 mg/dL)
Interventions	Atorvastatin 10 mg/d Rosuvastatin 5 mg/d Rosuvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 to 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	Rosuvastatin 5 mg/d and rosuvastatin 10 mg/d; treatment arms were not analysed

Atorvastatin for lowering lipids (Review)

Wang 2012 (Continued)

SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Incomplete outcome data (attrition bias) All outcomes	High risk	<p>Non-CVD group: For 47/120, efficacy was not reported because they did not achieve their target value</p> <p>CVD group: For 138/198, efficacy was not reported because they did not achieve their target value</p> <p>58% of participants were excluded from the efficacy analysis</p> <p>Risk of bias is high</p>
Selective reporting (reporting bias)	High risk	TC, HDL-C and TG data were not reported
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

Wei 2001

Methods	4-Week screening diet/placebo run-in period 16-Week open-label active study
Participants	33 men and women with FH Exclusion criteria: none Baseline TC: 9.1 mmol/L (352 mg/dL) Baseline LDL-C: 7.0 mmol/L (271 mg/dL) Baseline HDL-C: 1.33 mmol/L (51 mg/dL)
Interventions	Atorvastatin 10 mg/d for 0 to 4 weeks Atorvastatin 20 mg/d for 4 to 8 weeks Atorvastatin 40 mg/d for 8 to 12 weeks Atorvastatin 80 mg/d for 12 to 16 weeks
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C and HDL-C
Notes	Atorvastatin 20 mg/d for 4 to 8 weeks

Atorvastatin for lowering lipids (Review)

Wei 2001 (Continued)

Atorvastatin 40 mg/d for 8 to 12 weeks

Atorvastatin 80 mg/d for 12 to 16 weeks

Interventions were not analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	2/33 were not included in the efficacy analysis because 1 participant defaulted for personal reasons and 1 withdrew because of heartburn 6% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	High risk	TG data were not reported because they were expressed as median values
Other bias	Unclear risk	No source of funding was provided

Welder 2010

Methods	No participants received lipid-altering medication; therefore no wash-out was required 8-Week before-and-after trial
Participants	84 normal participants aged ≥ 18 years Exclusion criteria: coronary disease, pregnant, hepatic dysfunction Baseline TC: 4.65 mmol/L (180 mg/dL) Baseline LDL-C: 2.61 mmol/L (101 mg/dL) Baseline HDL-C: 1.55 mmol/L (60 mg/dL) Baseline TG: 1.08 mmol/L (96 mg/dL)
Interventions	Atorvastatin 80 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Welder 2010 (Continued)

Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	11.9% of participants were not analysed
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Wierzbicki 1998

Methods	4-Week wash-out period of previous lipid-lowering treatment 12-Week before-and-after trial	
Participants	54 individuals aged 18 to 70 years with severe FH; TC > 7 mmol/L (271 mg/dL) Exclusion criteria: none reported Baseline TC: 10.5 mmol/L (406 mg/dL) Baseline LDL-C: 8.10 mmol/L (313 mg/dL) Baseline HDL-C: 1.32 mmol/L (51 mg/dL) Baseline TG: 2.48 mmol/L (220 mg/dL)	
Interventions	Atorvastatin 80 mg/d	
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG	
Notes	-	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Blinding (performance bias and detection bias)	Unclear risk	Atorvastatin 80 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable

Atorvastatin for lowering lipids (Review)

Wierzbicki 1998 (Continued)

All outcomes

Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	The source of funding was not provided

Willrich 2008

Methods	4-Week wash-out baseline dietary stabilisation period 4-Week open-label trial
Participants	139 men and women of African or non-African descent with hypercholesterolaemia, mean age 57 years Exclusion criteria: hypertriglyceridaemia, TG \geq 4.52 mmol/L (400 mg/dL), hypothyroidism, diabetes mellitus, liver or kidney disease, secondary dyslipidaemia Baseline TC: 7.27 mmol/L (281 mg/dL) Baseline LDL-C: 4.99 mmol/L (193 mg/dL) Baseline HDL-C: 1.45 mmol/L (56 mg/dL) Baseline TG: 1.80 mmol/L (159 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	-

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Willrich 2008 (Continued)

Other bias	Low risk	The study seems to be free of other bias
------------	----------	--

Wu 2002

Methods	6-Week wash-out period 16-Week multi-centre randomised double-blind double-dummy study Randomisation was stratified by site, relying on a table of random numbers designed by Boston Bio-statistics Inc	
Participants	157 Asian individuals with elevated LDL-cholesterol, mean age 55 years (31-76), LDL-C 4.2 to 6.5 mmol/L (162-251 mg/dL), TG 4.2 to 6.5 mmol/L (372-576 mg/dL), modified ITT population consisted of 145 participants 73 participants received atorvastatin, 72 received simvastatin Exclusion criteria: uncontrolled hypothyroidism, type 1 and uncontrolled type 2 diabetes, hepatic dysfunction, unstable CVD, cancer, dementia, taking lipid-altering drugs, statin hypersensitivity, cerebrovascular disease, pulmonary disease, drug and alcohol abuse Atorvastatin baseline TC: 6.87 mmol/L (266 mg/dL) Atorvastatin baseline LDL-C: 4.78 mmol/L (185 mg/dL) Atorvastatin baseline HDL-C: 1.29 mmol/L (49.88 mg/dL) Atorvastatin baseline TG: 1.73 mmol/L (153 mg/dL)	
Interventions	Atorvastatin 10 mg/d for 0 to 8 weeks Atorvastatin 20 mg/d for 8 to 16 weeks Simvastatin 10 mg/d for 0 to 8 weeks Simvastatin 20 mg/d for 8 to 16 weeks	
Outcomes	Per cent change from baseline at 8 weeks of serum TC, LDL-C, HDL-C and TG	
Notes	First atorvastatin dose was analysed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable

Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Unclear risk	8/79 were not included in the efficacy analysis 10% of participants were excluded from the efficacy analysis
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured

Wu 2002 (Continued)

Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin
------------	-----------	--

Wu 2005

Methods	3-Month dietary stabilisation period 3-Month multi-centre randomised study	
Participants	66 men and women from Taiwan with hypercholesterolaemia, mean age 53 years; TC > 240 mg/dL (6.21 mmol/L) 32 participants received atorvastatin in the phase 1 study, 34 received atorvastatin in the phase 2 study, 34 received simvastatin in the phase 1 study, 32 received simvastatin in the phase 2 study Exclusion criteria: pregnancy or lactation, secondary HTN, serious cardiovascular event, serious intestinal ailment, liver cirrhosis, renal disease, unstable NIDDM, elevated CK, thyroid disease, nephrotic syndrome, alcoholism, confounding medication Atorvastatin baseline TC: 6.88 mmol/L (266 mg/dL) Atorvastatin baseline LDL-C: 4.27 mmol/L (165 mg/dL) Atorvastatin baseline HDL-C: 1.30 mmol/L (50.3 mg/dL) Atorvastatin baseline TG: 2.11 mmol/L (187 mg/dL)	
Interventions	Atorvastatin 10 mg/d Simvastatin 10 mg/d	
Outcomes	Per cent change from baseline at 3 months of serum TC, LDL-C, HDL-C and TG	
Notes	Atorvastatin group was analysed	

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Low risk	The study appears to be free of other sources of bias

Yoshitomi 2005

Methods	4-Week dietary stabilisation period 12-Week open-label multi-centre study
Participants	44 men and women aged ≥ 18 years; LDL-C > 140 mg/dL (3.62 mmol/L), TG < 400 mg/dL (4.52 mmol/L) Exclusion criteria: treated diabetes mellitus or FPG ≥ 110 mg/dL, active liver disease, hepatic or renal dysfunction, uncontrolled HTN, use of drug that interferes with lipid levels or interacts with study medication Baseline TC: 7.27 mmol/L (281 mg/dL) Baseline LDL-C: 4.86 mmol/L (188 mg/dL) Baseline HDL-C: 1.53 mmol/L (59 mg/dL) Baseline TG: 1.7 mmol/L (151 mg/dL)
Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 12 weeks of serum TC, LDL-C, HDL-C and TG
Notes	-

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	Unclear risk	No source of funding was provided

ZAPE 2003

Methods	4-Week placebo period 1-Year open-label randomised parallel-group multi-centre study
Participants	56 participants aged 10 to 18 years with FH and severe hypercholesterolaemia; Tanner stage II or greater at screening visit, LDL-C ≥ 200 mg/dL (5.2 mmol/L), TG ≤ 200 mg/dL (2.25 mmol/L) 25 participants received atorvastatin, 31 received colestipol

Atorvastatin for lowering lipids (Review)

ZAPE 2003 (Continued)

Atorvastatin baseline TC: 7.94 mmol/L (307 mg/dL)
 Atorvastatin baseline LDL-C: 6.56 mmol/L (254 mg/dL)
 Atorvastatin baseline HDL-C: 1.16 mmol/L (45 mg/dL)
 Atorvastatin baseline TG: 0.79 mmol/L (70 mg/dL)

Interventions	Atorvastatin 10 mg/d for 0 to 6 weeks Colestipol 5 mg/d for 0 to 6 weeks Atorvastatin 20 mg/d for 6 to 52 weeks Colestipol 10 mg/d for 6 to 52 weeks
Outcomes	Per cent change from baseline at 6 weeks of serum TC, LDL-C, HDL-C and TG
Notes	First atorvastatin dose was analysed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Pfizer funded the study; data may support bias for atorvastatin

Zhu 2000

Methods	6-Week baseline dietary stabilisation period 4-Week single-centre trial
Participants	25 individuals from Canada recruited from lipid clinic with hyperlipidaemia; TC > 6.2 mmol/L (240 mg/dL); none taking lipid-altering drugs Exclusion criteria: none reported 19 of 25 participants received atorvastatin Baseline TC: 7.62 mmol/L (295 mg/dL) Baseline LDL-C: 5.21 mmol/L (201 mg/dL) Baseline HDL-C: 1.38 mmol/L (53.36 mg/dL)

Atorvastatin for lowering lipids (Review)

Zhu 2000 (Continued)

Baseline TG: 2.19 mmol/L (194 mg/dL)

Interventions	Atorvastatin 10 mg/d
Outcomes	Per cent change from baseline at 4 weeks of serum TC, LDL-C, HDL-C and TG
Notes	SDs were imputed

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of random sequence generation is not applicable
Allocation concealment (selection bias)	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, assessment of allocation concealment is not applicable
Blinding (performance bias and detection bias) All outcomes	Unclear risk	Atorvastatin 10 mg/d; intervention was analysed, and as no placebo group was included for comparison, blinding status is not applicable
Incomplete outcome data (attrition bias) All outcomes	Low risk	Data on all participants were reported
Selective reporting (reporting bias)	Low risk	All lipid parameters were measured
Other bias	High risk	Parke-Davis Pharmaceuticals funded the study; data may support bias for atorvastatin

ACS: acute coronary syndrome; ALT: alanine transaminase; AST: aspartate aminotransferase; BID: twice daily; BMI: body mass index; CABG: coronary artery bypass graft; CAD: coronary artery disease; CHD: coronary heart disease; CK: creatine kinase; CPK: creatine phosphokinase; CVD: cardiovascular disease; DBP: diastolic blood pressure; ER: extended release; FH: familial hypercholesterolaemia; HDL-C: high-density lipoprotein cholesterol; HIV: human immunodeficiency virus; HRT: hormone replacement therapy; ITT: intention to treat; LDL-C: low-density lipoprotein cholesterol; MI: myocardial infarction; NIDDM: non-insulin-dependent diabetes; PAD: peripheral artery disease; PTCA: percutaneous transluminal coronary angioplasty; SBP: systolic blood pressure; SD: standard deviation; TC: total cholesterol; TG: triglyceride; TSH: thyroid-stimulating hormone; ULN: upper limit of normal; WDAE: withdrawal due to adverse effect.

Characteristics of excluded studies [ordered by study ID]

Study	Reason for exclusion
ACTFAST 2 2004	Bias: atorvastatin dose dependent on baseline LDL-C values
ADSL 2003	Bias: atorvastatin dose dependent on baseline LDL-C values
Ahmed 2008	Location not found for this document
Alrasadi K 2008	Confounding factor: niacin
Alvarez 1999	Renal transplantation confounding factor: immunosuppressants to prevent rejection of transplanted kidney

Study	Reason for exclusion
Arad 2005	Randomisation stratified by ratio of LDL-C to HDL-C
Argent 2003	Renal transplantation confounding factor: immunosuppressants to prevent rejection of transplanted kidney
ASG 2008	Bias: atorvastatin dosing based on LDL-C baseline values
AstraZeneca 3	Number of participants randomly assigned to atorvastatin not reported
AstraZeneca 4	Baseline lipid values not reported Data expressed as absolute change from baseline; therefore per cent change from baseline could not be determined
ATGOAL 2005	Bias: atorvastatin dosing based on baseline LDL-C values
Athyros 2008	Atorvastatin added to ezetimibe therapy
Atorvastatin 2008	Biased trial dosing based on LDL-C baseline values
Banyai 2001	Confounding factor: LDL apheresis treatment
Boh 2011	Bias: atorvastatin dose dependent on baseline LDL-cholesterol values; participants with low LDL-cholesterol received 10 mg/d Participants with high LDL-cholesterol received 20 mg/d
Bolewski 2008	Data expressed as median per cent change from baseline
Bonet 2002	Confounding factor: cyclosporine as immunosuppressant in heart transplantation
Brown 2004	Median per cent changes from baseline reported
CAPABLE	Bias: atorvastatin dose dependent on baseline LDL-C values
Carnevale 2010	Median per cent change in total cholesterol and LDL-cholesterol measured
COMPELL 2007	Confounding factor: niacin extended release
Conard 2008	Up-titration of atorvastatin monotherapy
Costa 2003	Median per cent changes from baseline reported
Davis 2000	Median per cent change from baseline for all lipid parameters
Di Renzo 2008	LDL-C values do not add up
DISCOVERY PENTA 2005	Data from statin-naive participants and from switched participants combined. No baseline dietary wash-out stabilisation period for at least 3 weeks for switched participants
Dogra 2002	Atorvastatin dose adjusted to lower serum LDL-C to 3.4 mmol/L and TG to ≤ 1.8 mmol/L
Dujovne 2000	Median per cent changes from baseline reported
Faludi 2004	Exact number of participants receiving atorvastatin not reported

Study	Reason for exclusion
Farsang 2007	Bias: atorvastatin dose dependent on baseline LDL-C
Ferrer-Garcia 2008	Bias: atorvastatin dose dependent on baseline LDL-C
Gandelman 2011	Bias: only participants with sufficient LDL-cholesterol decrease reported
Geiss 1999	Confounding factor: LDL apheresis
Goldammer 2002	Confounding factor: LDL-C apheresis
Gupta 2004	LDL-C values do not add up
Ishigami 2003	Participant selection bias
Jafari 2003	LDL-C values do not add up
Jose 2012	Per cent change from baseline could not be calculated because baseline values and per cent change were not reported
Jyoti 2008	Article not available via interlibrary loan; study author contacted; no response
Kaya 2009	Lipid parameters do not add up
Kearns 2008	LDL-C values do not add up
Krysiak 2010	LDL-C numbers do not add up according to Friedewald formula
Lamon-Fava 2007	Data could not be expressed as per cent change from baseline for placebo, atorvastatin 20 mg and atorvastatin 80 mg. Data expressed as per cent change from placebo Lipid data combined for all phases of cross-over trial; data not provided before first cross-over point
Lee 2010	Evident bias introduced; atorvastatin dosing dependent on baseline LDL-C
Lundberg 2010	Data reported as median values
McVey 1999	Data are biased: Participants with higher LDL-C baseline values received higher doses LDL-C 4.83 mmol/L received 10 mg/d LDL-C 5.62 mmol/L received 40 mg/d LDL-C 8.13 mmol/L received 80 mg/d
Meas 2009	Impossible outcome. TC went down from 1.98 to 1.6 g/L; TC went up from 5.12 to 6.6 mmol/L
Nawawi 2003	Median values recorded
Nicholls 2011	Data taken from follow-up visit 7 after 12 weeks of treatment
Paolisso 2000	SDs reported are impossible SDs for atorvastatin group are 4 times the value of the placebo group or greater; therefore mean values are also suspect
Perez-Castrillon 2007	Bias: atorvastatin dose based on TC and TG baseline values
Pfizer Inc 10	Bias: atorvastatin dose dependent on baseline LDL-C values

Study	Reason for exclusion
Pfizer Inc 11	Per cent change from baseline for each group was not reported and cannot be calculated. Per cent change from baseline for T/A compared with atorvastatin was reported
Pfizer Inc 13	Per cent change from baseline for each group was not reported. Mean difference between T/A vs atorvastatin was reported
Pfizer Inc 14	Per cent change from baseline for each group was not reported. Mean difference between T/A vs atorvastatin was reported
Pfizer Inc 5	Bias: atorvastatin dose dependent on baseline LDL-C values
Puccetti 2001	Per cent change from baseline could not be retrieved from data after 6 weeks of atorvastatin dosing
Puccetti 2011	Data reported as median per cent change from baseline with interquartile ranges
Riahi 2006	Lipid data combined for all phases of cross-over trial and not provided before first cross-over point. Data for placebo and atorvastatin groups combined
Riesen 2002	Median per cent change from baseline reported
Roberto 2010	Lipid data expressed as median per cent change
Schaefer 2002	Per cent change from placebo, not baseline
Schaefer 2004	Per cent change from placebo, not baseline
Schuster 1998	Per cent change from baseline for all lipid parameters expressed as median values
Soedamah-Muthu 2003	Median per cent change from baseline reported
Son 2013	Bias: atorvastatin dose dependent on baseline LDL-cholesterol values
Sparks 2005	Values from graph not reliable
Tutunov 2008	Outcomes expressed as per cent change from baseline as range of values (values not specific)
Undas 2006b	Median per cent change from baseline reported
VYMET 2009	<p>Some participants did not have a wash-out dietary stabilisation period</p> <p>"Eligible patients naive to lipid-lowering agents (no agent within 6 weeks [8 weeks for fibrates] before the first visit) who were at high risk of CHD or those receiving lipid-lowering therapy who were at moderately high risk of CHD were randomized to treatment"</p> <p>113/686 (16.5%) atorvastatin-treated participants had no baseline wash-out period</p>
Wanner 2005	Median per cent change from baseline reported
Wierzbicki 1999	<p>Study bias: dosing based on theoretically matched LDL reduction protocol</p> <p>Participants with higher LDL-C baseline values received higher doses</p> <p>LDL-C 5.92 mmol/L received atorvastatin 10 mg/d</p> <p>LDL-C 6.37 mmol/L received atorvastatin 20 mg/d</p> <p>LDL-C 7.20 mmol/L received atorvastatin 40 mg/d</p> <p>LDL-C 8.38 mmol/L received atorvastatin 80 mg/d</p>

Study	Reason for exclusion
Winkler 2004	Design flawed; participants received fenofibrate, then atorvastatin
Yamamoto 2000	Confounding factor: probucol
Yang 2007	Per cent decrease in LDL-C 36% less than TC. Data erroneous. 33.8% decrease in TC and 12.2% decrease in LDL-C
Yildiz 2007	Bias: atorvastatin doses based on LDL-C baseline values
Yilmaz 2005	Lipid parameters do not add up according to Friedewald equation

LDL-C: low-density lipoprotein cholesterol; TC: total cholesterol; TG: triglyceride.

DATA AND ANALYSES

Comparison 1. Atorvastatin 5.0 mg vs control

Outcome or sub-group title	No. of studies	No. of participants	Statistical method	Effect size
1 Total cholesterol	3	103	Mean Difference (IV, Fixed, 95% CI)	-26.04 [-29.81, -22.28]
2 LDL-cholesterol	4	155	Mean Difference (IV, Fixed, 95% CI)	-33.41 [-37.44, -29.39]
3 HDL-cholesterol	4	155	Mean Difference (IV, Fixed, 95% CI)	7.99 [3.54, 12.44]
4 Triglycerides	3	103	Mean Difference (IV, Fixed, 95% CI)	-27.87 [-39.25, -16.49]

Analysis 1.1. Comparison 1 Atorvastatin 5.0 mg vs control, Outcome 1 Total cholesterol.

Analysis 1.2. Comparison 1 Atorvastatin 5.0 mg vs control, Outcome 2 LDL-cholesterol.

Analysis 1.3. Comparison 1 Atorvastatin 5.0 mg vs control, Outcome 3 HDL-cholesterol.

Analysis 1.4. Comparison 1 Atorvastatin 5.0 mg vs control, Outcome 4 Triglycerides.

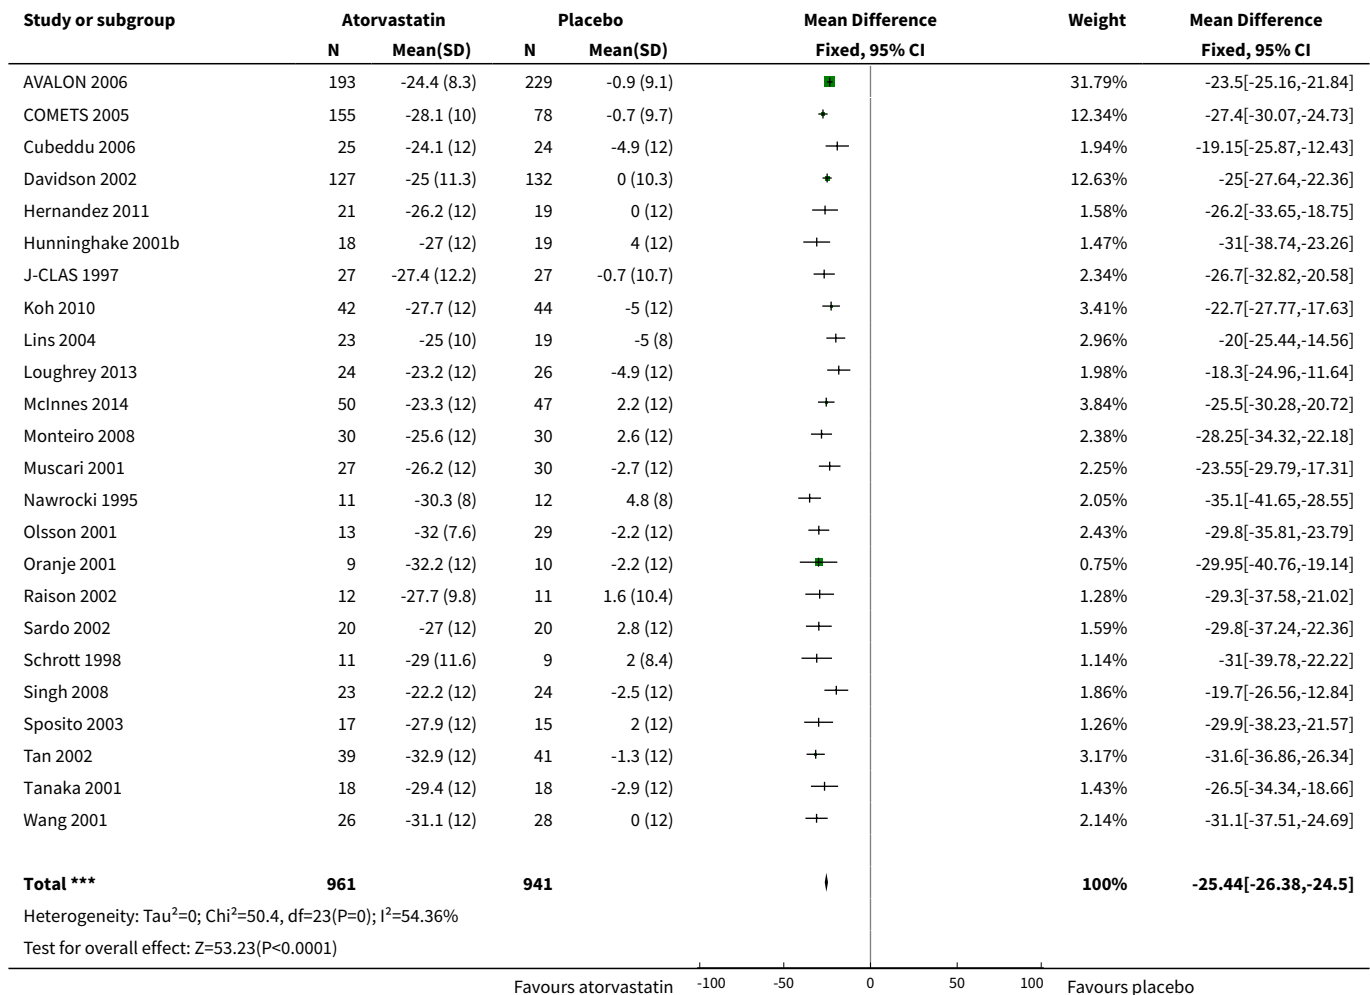

Comparison 2. Atorvastatin 10 mg vs control

Outcome or sub-group title	No. of studies	No. of participants	Statistical method	Effect size
1 Total cholesterol	24	1902	Mean Difference (IV, Fixed, 95% CI)	-25.44 [-26.38, -24.50]

Outcome or sub-group title	No. of studies	No. of participants	Statistical method	Effect size
2 Total cholesterol	153	18009	% change from baseline (Fixed, 95% CI)	-27.05 [-27.21, -26.89]
3 LDL-cholesterol	26	2281	Mean Difference (IV, Fixed, 95% CI)	-35.91 [-37.06, -34.76]
4 LDL-cholesterol	162	19671	% change from baseline (Fixed, 95% CI)	-37.12 [-37.32, -36.93]
5 HDL-cholesterol	26	2116	Mean Difference (IV, Fixed, 95% CI)	3.82 [2.61, 5.02]
6 HDL-cholesterol	158	17052	% change from baseline (Fixed, 95% CI)	4.66 [4.44, 4.88]
7 Triglycerides	20	1936	Mean Difference (IV, Fixed, 95% CI)	-20.36 [-23.06, -17.65]
8 Triglycerides	146	17113	% change from baseline (Fixed, 95% CI)	-17.79 [-18.24, -17.35]

Analysis 2.1. Comparison 2 Atorvastatin 10 mg vs control, Outcome 1 Total cholesterol.

Analysis 2.2. Comparison 2 Atorvastatin 10 mg vs control, Outcome 2 Total cholesterol.

WHAT'S NEW

Date	Event	Description
24 January 2017	Amended	corrected minor errors in citations in the additional references section; corrected citation Adams 2012a to Adams 2014; added reference to the atorvastatin protocol.

HISTORY

Protocol first published: Issue 1, 2010

Review first published: Issue 12, 2012

Date	Event	Description
1 August 2014	New citation required and conclusions have changed	Addition of 42 new trials allowed expansion of conclusions of the original review
1 August 2014	New search has been performed	Search was updated and 42 new trials were identified for inclusion
4 March 2014	Amended	Data in 'Summary of findings' table were corrected

CONTRIBUTIONS OF AUTHORS

- JMW, MT and SPA contributed to the design of the protocol.
- MT extracted the data.
- SPA extracted and analysed the data.

DECLARATIONS OF INTEREST

None.

Atorvastatin for lowering lipids (Review)
