# Temporal patterns of imidacloprid resistance throughout a growing season in *Leptinotarsa decemlineata* populations

Justin Clements,<sup>\*</sup> Sean Schoville, Nathan Clements, Scott Chapman and Russell L Groves

The authors of the article “Temporal patterns of imidacloprid resistance throughout a growing season in *Leptinotarsa decemlineata* populations” (DOI: 10.1002/ps.4480),<sup>1</sup> published in Wiley Online Library on 30 December 2016 and in *Pest Management Science*, 73: 641–650, have drawn our attention to an error in the conversion of concentrations of insecticide stocks. To follow journal guidelines all concentrations were converted from parts per million (PPM) to  $\mu\text{g}/\mu\text{l}$  before publication. The conversion to  $\mu\text{g}/\mu\text{l}$  was made under the assumption that parts per million referred to moles solute per moles solvent. In reality PPM referred instead to mass solute/mass solvent. While this does not change any of the conclusions within the manuscript, it slightly alters the numerical values for the  $\text{LC}_{50}$ . The conversion mistake can be corrected by simply multiplying the concentration of the solutions or the  $\text{LC}_{50}$  values by 0.227. The authors apologize for the oversight.
