

Since January 2020 Elsevier has created a COVID-19 resource centre with free information in English and Mandarin on the novel coronavirus COVID-19. The COVID-19 resource centre is hosted on Elsevier Connect, the company's public news and information website.

Elsevier hereby grants permission to make all its COVID-19-related research that is available on the COVID-19 resource centre - including this research content - immediately available in PubMed Central and other publicly funded repositories, such as the WHO COVID database with rights for unrestricted research re-use and analyses in any form or by any means with acknowledgement of the original source. These permissions are granted for free by Elsevier for as long as the COVID-19 resource centre remains active.

Giving birth under lockdown during the COVID-19 epidemic

ARTICLE INFO

Article history:

Received 2 May 2020

Available online 11 May 2020

The COVID-19 epidemic has greatly impacted hospital organization in all affected countries, where visits to hospitalized patients have been restricted or even banned. These measures, which were dictated to limit the risk of spread of the epidemic, have also been applied to maternity wards in Europe and the USA. Most maternity wards have therefore decided to allow the presence solely of the pregnant woman's partner in the delivery room and to prohibit visits during postpartum hospital stay. Such an arrangement exposes mothers who have been given birth in isolation and the effect is amplified once they return home. Indeed, the lockdown measures implemented in most countries prevent visits by family members and limit face-to-face management by caregivers. This places mothers in a situation of greater psychological vulnerability and heightens the risk of postpartum depression and of disrupted mother-infant bonding, which may be weighted or worsened by the balance of the couple. We expect this impact to be even greater in vulnerable mothers in the context of dysfunctioning social services.

Following implementation from 20 March 2020 of measures to restrict visits at the three maternity units of APHP.Sorbonne University in Paris, a new arrangement was put in place and offered women giving birth in these units the possibility of a telephone interview with a psychologist at days 10–12 postpartum, plus another one 6–8 weeks later. These standardized interviews of approximately 30 min comprise a free exchange followed by a psychological assessment using questionnaires validated during the perinatal period. In the first interview, the conditions of discharge home are discussed and the mother's experience of childbirth is discussed and the mother's experience of childbirth is evaluated by means of the perinatal post-traumatic stress disorder (PTSD) questionnaire [1]. The following are also evaluated during the two interviews: the Mother-Infant Bonding Scale [2], the Dyadic Adjustment Scale [3], and the Edinburgh Postnatal Depression Scale [4], using a score >12 as the threshold defining increased risk of postpartum depression, so as to propose suitable psychological or psychiatric support. Eighty percent of women adhered to this follow-up in the first three weeks after lockdown in our units.

The rate of postpartum depression in the general population is about 15 % [4] and it would not be surprising if this figure is increased by lockdown measures during the COVID-19 epidemic [5]. We feel that the organization implemented to reduce the risk

of psychological vulnerability should be extended to personnel who provide care at childbirth. The results of this organization will be important for other parts of the world, notably in adapting necessary care to the management of these situations of psychological vulnerability at a time critical for mother-infant bonding and the development of family functioning.
