Environ Health Perspect 128(4): 047011 (2020), <https://doi.org/10.1289/EHP6262>

An error was made in the conversion from $\mu\text{g}/\text{kg}/\text{d}$ to $\mu\text{mol}/\text{kg}/\text{d}$ in the Methods section under the PCB-153 Exposure subsection. In the second paragraph of that subsection, the dose was incorrectly indicated as $0.25 \mu\text{mol}/\text{kg}/\text{d}$ when it should be $0.15 \mu\text{mol}/\text{kg}/\text{d}$. This error occurred in the first and last sentence of the specified paragraph.

The highest rodent NOAEL was also incorrectly indicated in the second sentence of the second paragraph of the PCB-153 Exposure subsection as $250 \text{ mg}/\text{kg}/\text{d}$ when it should be $125 \text{ mg}/\text{kg}/\text{d}$, according to the cited reference. The values for the dose in $\mu\text{g}/\text{kg}/\text{d}$ remain correct, and the values for the rodent NOAEL were correct in all other sections of the article.

The specified errors had no impact on the results or findings. The manuscript has been updated to correct these errors.

The authors regret these errors.
