

Since January 2020 Elsevier has created a COVID-19 resource centre with free information in English and Mandarin on the novel coronavirus COVID-19. The COVID-19 resource centre is hosted on Elsevier Connect, the company's public news and information website.

Elsevier hereby grants permission to make all its COVID-19-related research that is available on the COVID-19 resource centre - including this research content - immediately available in PubMed Central and other publicly funded repositories, such as the WHO COVID database with rights for unrestricted research re-use and analyses in any form or by any means with acknowledgement of the original source. These permissions are granted for free by Elsevier for as long as the COVID-19 resource centre remains active.

Fig. 1. Chest CT examinations obtained at day 1 and day 20 in a 62-year-old man with severe COVID-19 pneumonia. A, B, CT images in the axial (A) and coronal (B) planes in lung window obtained at day 1 of hospitalization reveal ground glass opacities (arrowheads) and linear consolidations (arrow). C, D, Follow-up CT images in the axial (C) and coronal (D) planes in lung window at the same level than in A & B, obtained at day 20 of hospitalization in intensive care unit demonstrate a large cavitation (arrows) and evolution towards consolidation of ground glass opacities (curved arrow) in the right upper lobe, interlobular septal thickening resulting in left upper lobe crazy paving appearance (dotted circle), cystic changes (large wave arrow) and traction bronchiectasis (thin wave arrows).

A 62-year-old man was hospitalized in intensive care unit for severe Covid-19 pneumonia confirmed by reverse-transcriptase polymerase chain reaction positivity on oropharyngeal swabs. At initial examination, arterial blood pressure was within the normal range (100/76 mmHg) but tachyarrhythmia (heart rate,

120/min), tachypnea (respiratory rate, 38/min) and low oxygen saturation at 82% were found. Body temperature was 38.1 °C. Supplemental oxygen (15 L/min) was insufficient to restore oxygen saturation above 90% and sedation and orotracheal intubation were required. Laboratory tests revealed hemoglobin concentration of 16.8 g/dL, platelet count of $306 \times 10^9/\text{L}$, leucocyte count of $13.5 \times 10^9/\text{L}$ and fibrinogen serum level of 6.13 g/L. Procalcitonin serum level was not elevated. Initial low dose computed tomography examination (CT) [1] was strongly suggestive of COVID-19

pneumonia (Fig. 1A and B). Repeated cultures from bronchoalveolar lavage were positive for *methicillin-sensitive-Staphylococcus aureus*, *Pseudomonas-Aeruginosa* and *Klebsiella-Pneumonia*. The patient was given meropenem, tobramycin and ciprofloxacin with gradual improvement of symptoms. Follow-up CT examination showed thin-walled large cavity within consolidation of the right upper lobe (Fig. 1C and D). Additional bacteriological tests were positive for *Aspergillus-niger* on bronchoalveolar fluid and aspergillus antigenemia. Antifungal treatment (amphotericin B then voriconazole) was added, followed by a favorable clinical course. Typical CT patterns of COVID-19 pneumonia are well known, but lung cavitation remains uncommon [2]. It might be explained by viral damage to the alveolar walls leading to pneumatoceles. Bacterial and fungal superinfections can also be observed.

Informed consent and patient details

The authors declare that this report does not contain any personal information that could lead to the identification of the patient(s) and/or volunteers.

Funding

This work did not receive any grant from funding agencies in the public, commercial, or not-for-profit sectors.

Author contributions

All authors attest that they meet the current International Committee of Medical Journal Editors (ICMJE) criteria for Authorship.

CRediT authorship contribution statement

Amine Ammar: conceptualization, writing - original draft preparation, visualization. Jean-Luc Drapé: supervision, writing - review & editing. Marie-Pierre Revel: supervision, writing - review & editing, validation.

Disclosure of interest

The authors declare that they have no competing interest.
