ABSTRACT We report the high-quality draft assemblies and gene annotations for 13 species and/or strains of the protozoan parasite genera *Leishmania*, *Endotrypanum*, and *Critchidia*, which span the phylogenetic diversity of the subfamily Leishmaniinae within the kinetoplastid order of the phylum Euglenozoa. These resources will support studies on the origins of parasitism.

*L*eishmania species are widespread parasites of mammals transmitted by biting insects. Over 1.7 billion people worldwide are at risk, with hundreds of millions of people infected (1–4). The genus comprises more than 50 species, which are primarily zoonotic but in humans cause disease ranging from mild cutaneous lesions to more disseminated forms to fatal visceralizing disease (5). While parasitism by *Leishmania* has been intensively studied, the species-specific factors that enable mammalian or insect host infections are less well understood. To provide a broad phylogenetic snapshot, we selected a spectrum of species and strains across the subfamily Leishmaniinae (5), targeting lineages within the subgenera *Leishmania*, *Viannia*, and *Mundinia*, as well as the allied genus *Endotrypanum* and the outgroup *Critchidia fasciculata* (Table 1). The WU Institutional Biosafety Committee reviewed and approved the parasite work reported here (01-015).

Parasites were cultivated in M199 or Schneider's medium (6) and grown to late log phase before harvesting, lysis, and DNA purification by phenol-chloroform extraction and/or banding in CsCl gradients (to remove mitochondrial maxi- or minicircle DNA). Sequencing libraries were generated using the Illumina paired-end DNA sample preparation kit (PE-102-1001) according to the manufacturer's directions. Fragment libraries of 3 and 8 kb were prepared using protocols for 454 sequencing (Roche Life Sciences). Sequencing was performed on either a 454 GS FLX Titanium (average read length, 305 bp; Roche 454 Life Sciences) or Illumina Genome Analyzer IIx (GAIix) and HiSeq 2000 instruments (paired-end 100-bp format), except for *Critchidia*, which additionally utilized long reads generated on an RS II instrument (P5/C3 chemistry; Pacific Biosciences) (7). The total sequence genome coverage on the Illumina GAIix and HiSeq 2000 instruments was on average 105× with tiered library insert sizes (50× fragments;

45 × 3 kb, 10 × 8 kb, and 0.05 × 40 kb). For all Illumina sequences, we used the read processing steps within the AllPaths-LG (8) software prior to *de novo* assembly, which incorporates read error correction methods described by Pevzner et al. (9). Genome assemblies were conducted with default parameters using Newbler v2.0.1 (10) for 454 reads, AllPaths-LG (8) for Illumina reads, and HGAP v3 (11) for long reads (Table 1). Contigs and scaffolds were organized into pseudochromosomes using ABACAS2 (<https://github.com/satta/ABACAS2>), a successor to ABACAS (12), by alignment with the *Leishmania major* Friedlin genome sequence, with the exception of *Leishmania braziliensis* M2903 and *Leishmania panamensis*, which were aligned to the *L. braziliensis* M2904 genome. The estimated haploid genome sizes ranged from 30.4 to 41.3 megabases (13).

Gene annotations were performed using the comprehensive Companion tool, which incorporates a variety of *de novo* prediction criteria, as well as information from closely related genomes when available (14). The number of protein-coding genes predicted ranged from 8,285 to 9,619, typical of other *Leishmania* species (13). Full annotations, as well as a variety of tools for the visualization or analysis of these genomes, are available from TriTrypDB ([www.tritrypdb.org](http://tritrypdb.org/tritrypdb)).

Data availability. The assemblies have been deposited in the NCBI GenBank repository under the BioProject accession numbers in Table 1, including links to the primary data and annotations ([PRJNA50303](#), [PRJNA50301](#), [PRJNA192717](#), [PRJNA192712](#), [PRJNA192710](#), [PRJNA169676](#), [PRJNA169673](#), [PRJNA165955](#), [PRJNA165959](#), [PRJNA192711](#), [PRJNA192703](#), [PRJNA165953](#), and [PRJNA165885](#)). The chromosome builds are available through the TriTrypDB portal (<http://tritrypdb.org/tritrypdb>).

ACKNOWLEDGMENTS

NIH grant AI29646 to S.M.B. provided support for N.S.A., D.E.D., and L.-F.L.; NIH-NHGRI grant HG00307907 to R.K.W. supported W.C.W. and C.T.; and AI103858 to P.J.M. supported G.R. Funding to C.H.-F. from Wellcome Trust grants WT099198MA and WT108443MA provided support for F.S.-F., A.S., and S.S.

We thank Patrick Minx for assembly curation. We thank the colleagues listed in Table 1 for generously providing the strains and Brian Brunk, David Roos, Thomas Otto, and Matt Berriman for discussions.
