Translational perspectives

PLB, the reversible inhibitor of SERCA2A, is of critical importance for the SR Ca²⁺ sequestration thereby the excitation–contraction coupling of myocytes and myocardial remodelling. The activity of PLB could be inhibited by β1-AR-cAMP-PKA pathway through PKA-mediated protein phosphorylation. The present study demonstrated that HuR is able to modulate cardiac remodelling by regulating the expression of PLB and β1-AR. These findings reveal novel mechanisms controlling myocardial remodelling and may provide new clues for strategies to interfere cardiac remodelling-related heart disorders in humans.

Corrigendum
