Abstract

Background: To reduce the impact of depression on PLWH, we are implementing a clinic-based behavioral health screener and referral to ORCHID (Optimizing Resilience and Coping with HIV through Internet Delivery), an evidenced-based intervention. We used the Consolidated Framework for Implementation Research (CFIR) to identify contextual barriers and facilitators in advance of implementation.

Setting: 16 Chicagoland area Ryan White Medical Case Management (RWMCM) sites.

Methods: We conducted a sequential mixed-methods study with medical case managers and supervisors. Participants completed an online survey assessing CFIR domains, scored on a 1 (strongly disagree) to 5 (strongly agree) scale. Survey results informed a purposive sampling frame and interview protocol. Interviews were analyzed by rapid qualitative analysis.

The authors report no conflicts of interest.

Results: On average, survey respondents ($n=58$) slightly agreed with positive views of team culture, learning climate, and implementation readiness ($M_s=3.80-3.87$). Potential barriers included intervention complexity ($M=3.47$), needed human resources ($M_s=2.71-3.33$), and only slight agreement with relative advantage over existing screening/referral systems ($M_s=3.09-3.71$). Qualitative results ($n=15$) identified low advantage for clinics with robust behavioral health systems but strong advantage in clinics without these services. Respondents identified system-wide training and monitoring strategies to facilitate implementation.

Conclusion: RWMCM sites are a generally favorable context for implementation of the interventions. As illustrated in an implementation research logic model, barriers will be addressed through deploying strategies proposed to impact clinic- and individual-level outcomes, including electronic prompts (reduce complexity), training on ORCHID as a complement to other behavioral health services (increase relative advantage), and feedback during implementation (strengthen rewards/incentives).

Keywords

HIV; Positive Affect; Depression; Screening; Implementation

Introduction

Depression is highly prevalent among people living with HIV (PLWH),^{1, 2} and is associated not only with a lower quality of life but also with HIV progression, lower retention in care, and a lower likelihood of viral suppression.³⁻⁶ ORCHID (Optimizing Resilience and Coping with HIV through Internet Delivery) is an evidence-based intervention that lowers symptoms of depression by teaching skills that help individuals experience positive emotions, even during stressful times.⁷ Although prior research found ORCHID effective at reducing depression symptoms and decreasing viral load,⁷⁻⁹ it has not been evaluated in a clinic setting. In order to leverage ORCHID to effectively address depression among PLWH and help realize the goals of the National Ending the HIV Epidemic Plan,¹⁰ we are conducting research to guide, and later evaluate, its implementation in the context of a Hybrid Type 2 stepped wedge cluster-randomized trial. In partnership with AIDS Foundation Chicago (AFC), we will roll-out ORCHID in Ryan White Medical Case Management (RWMCM)¹¹ sites in the Chicagoland area in tandem with their launch of a behavior health screener (BHS; i.e., mental health and substance use), through which clients with elevated depression symptoms will be referred to ORCHID.

The BHS developed by AFC includes standardized assessments on: depression (PHQ-9¹²), anxiety (GAD-7¹³), post-traumatic stress symptoms (PCL-C¹⁴), alcohol use (AUDIT¹⁵), and substance use (DAST-10¹⁶). The BHS was designed to be administered by medical case managers (MCMs), i.e., trained staff who provide patient-centered services to eliminate barriers and promote engagement with HIV-related medical care.¹⁷⁻¹⁹ In early 2019, AFC launched a pilot to better understand the behavioral health needs of clients receiving RWMCM services. Six subcontracted agencies piloted the BHS; of 777 eligible clients, 374 (48.1%) were offered the screener. Of the 282 who completed the PHQ-9, 33.3% ($n=94$) had scores ≥ 5 , indicating clinically significant depressive symptomatology. Qualitative data collected during the pilot indicated that staff were concerned that available mental health

services were not sufficient (e.g., were too costly, had long wait times) to meet client needs identified through the screener.¹⁹

By virtue of its online, self-guided format, ORCHID addresses several barriers to receiving mental health services. ORCHID is an evidence-based intervention that consists of eight empirically-supported skills that increase positive affect (i.e., positively-valenced feelings, e.g., calm, satisfied, excited, thrilled), even in the face of stress:^{20–26} (1) noting daily positive events; (2) savoring positive events; (3) gratitude; (4) mindfulness; (5) positive reappraisal; (6) focusing on personal strengths; (7) setting and working toward attainable goals; and (8) self-compassion.²⁷ Among PLWH, positive affect has been linked to a number of benefits including lower depression levels,²⁸ slower disease progression,^{29, 30} higher likelihood of viral suppression,³¹ and lower risk of mortality.²⁷ The intervention has demonstrated feasibility, acceptability, and efficacy in pilot tests and RCTs among multiple clinical samples, including people with depression and PLWH.^{7–9, 27} Specifically, RCTs conducted among PLWH have found that participants in the in-person version of ORCHID reported higher levels of past day positive affect, were less likely to use antidepressants, and were more likely to be virally suppressed.^{8, 9} A pilot of the online self-guided version of ORCHID showed increased positive emotions and decreased depressive mood in PLWH.⁷

In the present trial, MCMs will refer all clients with PHQ-9 scores ≥ 5 to ORCHID through a brief interest form and/or distribution recruitment materials (e.g., online flyer). In the pre-implementation work reported here, we conducted a needs assessment to identify facilitators and barriers that could be used to guide implementation strategies to support the implementation of the BHS+ORCHID in the RWMCM system.

Methods

We conducted a sequential mixed-methods study with Medical Case Managers (MCMs) and supervisors in the RWMCM system in Chicago. Surveys and interviews were guided by the Consolidated Framework for Implementation Research (CFIR),³² a meta-theoretical framework focused on five domains important for implementing a new practice/intervention. We synthesized these data in an Implementation Research Logic Model (IRLM), a semi-structured tool designed to increase rigor and reproducibility by mapping the relationships between implementation determinants, strategies, mechanisms of influence, and outcomes.³³

Participants

Survey and interview participants were MCMs and MCM supervisors at 16 RWMCM sites in the Chicagoland area. Eligibility criteria were (1) current employment as a MCM or Supervisor, (2) age 18 or older, and (3) ability to read or write in English.

Survey

Recruitment and Data Collection—All current MCMs and supervisors from the 16 RWMCM sites with co-located clinical services were emailed an invitation to participate in a survey about implementing the BHS+ORCHID. After completing an online consent form, participants were linked to a REDCap survey.³⁴ All participants received a \$20 e-gift card as compensation.

Measures—Survey items were selected and adapted from existing research³⁵ (e.g., the Practice Adaptive Reserve Scale,³⁶ ARTAS implementation evaluation³⁷) and supplemented with several items written specifically for this project. CFIR constructs included in the survey were selected by the interdisciplinary study team (which included AFC staff and social/health psychology, social work, nursing, implementation science and public health researchers) based on findings from the BHS pilot and prior experiences working with MCMs and PLWH. Unless noted, all items were scored from 1=strongly disagree to 5=strongly agree.^{35–37} See Tables 1 and 2 for specific items and internal consistency of included scales.

Quantitative Analysis—Subscales for each construct were created and descriptive statistics (mean, standard deviation, range) were computed, both overall and for each clinic. All items and subscales were scored such that higher values indicated a more positive environment for implementation.

Key Informant Interviews

Recruitment and Data Collection—After analyzing survey data, MCMs and supervisors, i.e., key informants, were purposively sampled to ensure roughly equal representation of: (1) clinics with low and high means on CFIR constructs, and (2) length of employment in case management (under and over 5 years). Staff selected for inclusion ($n=24$) were emailed an invitation, and, if interested, were linked to an online consent form and scheduled for an interview. All interviews were conducted and recorded via a video conferencing service (i.e., Zoom). Interviews lasted about 75 minutes (Range: 36–100 minutes; the shortest interview was with a seasoned supervisor who gave succinct answers) and each participant received a \$50 e-gift card as compensation.

The team developed separate MCM and Supervisor interview guides that explored: (1) implementing the BHS, (2) implementing the referral to ORCHID, and (3) the overall implementation process. Questions were drawn from all five CFIR domains³² and selected to elicit details on key survey findings, e.g., perspectives on the relative advantage of the BHS+ORCHID. Before each section, interviewers provided descriptive information about the BHS and ORCHID. The guides were further refined after pilot interviews with two AFC staff who were former MCMs and Supervisors (See Supplementary Table 1 for sample questions). After each interview, interviewers completed a field note to capture relevant themes and follow-up areas.³⁸

Qualitative Analysis—After interviews were professionally transcribed, five coders analyzed the data using a four-step Rapid Qualitative Analysis (RQA) approach.³⁹ First, we developed a structured template mapping the relationships between major analytic domains, interview questions, and CFIR constructs. After piloting the template with a single interview to refine usability and inter-rater reliability, each coder independently analyzed 3–4 transcripts. The team then met to discuss key findings and to develop an analytic matrix of deductively derived codes, at which point coders independently synthesized key barriers, facilitators, and quotes, along with relevant CFIR constructs and potential implementation strategies. This approach was supplemented with open coding⁴⁰ to capture themes not

included in the matrix. The analysts met a final time to evaluate overall agreement in coding, with coding differences resolved via discussion.

All procedures were reviewed by the Institutional Review Board at Northwestern University, which deemed the study as not human subjects research.

Synthesis and Application using Implementation Research Logic Model

Survey and interview responses were converted to CFIR ratings using the following schema: *Ms* 1–1.499=–2 (strong barrier); *Ms* 1.5–2.499=–1 (moderate barrier); *Ms* 2.5–3.499=0 (neutral); *Ms* 3.5–4.499=+1 (moderate facilitator); *Ms* 4.5–5=+2 (strong facilitator); “mixed” (+/–) if > 2 sites had an opposite-valenced responses to the modal response. When key informants addressed constructs not captured in the surveys, the team devised a rating through discussion. In an iterative discussion-based process, our interdisciplinary team used these findings to select relevant implementation strategies. To support broader efforts to systematize implementation strategies, we also mapped our strategies on to those identified in the Expert Recommendations for Implementing Change (ERIC).⁴¹ We then developed an initial IRLM that included CFIR ratings of relevant contextual determinants, implementation strategies, and potential mechanisms of influence important for understanding the planned implementation and effectiveness outcomes (See Figure 1).

Results

Participants

In total, $n=58$ MCMs and supervisors from all 16 clinics completed the survey (70% response rate), and, of 24 invited, $n=9$ MCMs and $n=6$ Supervisors ($n=15$; 62.5% response rate) from 11 clinics completed an interview. Mean years in case management was 4.7 for MCMs, and 7.4 for supervisors. About half (43%) of respondents reported education beyond a bachelor’s degree and 11% of respondents reported participation in the BHS pilot.

Outer Setting

In surveys (see Table 1), depression was identified as the most common behavioral health concern. Most staff perceived that clients had daily internet access, with the most common device being a smartphone. Most clinics had some *incentives* and *reporting requirements* related to behavioral health screening, but less than half were required to report the *results* of these screenings.

Elaborating on survey findings, MCMs described serving clients with PTSD, psychosis, homelessness, and high levels of resource instability, in addition to depression and anxiety. All informants were frustrated by the lack of behavioral health services in the community, and access to care was especially limited for non-English speaking clients (Row 1, Table 3/Supplementary Table 2). MCMs feared that stigma could negatively influence clients’ willingness to provide truthful answers to the BHS or that clients would be frustrated by responding to BHS questions when their primary need was resource counseling. Staff also were concerned that high mental health acuity could be a barrier to using ORCHID—a concern heightened by the pandemic. In contrast to survey findings, MCMs perceived

that client access to technology could be a significant barrier to using ORCHID. In addition, some staff indicated that their clients might not be motivated to use ORCHID, especially if their primary presenting problem was housing or food insecurity (Row 2, Table 3/Supplementary Table 2).

Inner Setting

Survey responses (see Table 1) indicated that teams were perceived as being *responsive to client needs*, with a supportive *culture*, *learning climate*, and leadership that exhibited *implementation readiness* (e.g., *supports change efforts*). However, respondents also expressed moderate agreement that a *stressful culture* existed within teams, and low rates of effective referrals and supportive care resources to serve clients.

Consistent with survey findings, almost every key informant described having a strong team culture characterized by high levels of communication, a commitment to supporting client well-being, and a willingness to try new things (Row 3, Table 2/Supplementary Table 2). However, there was significant variability in how clinics screened for behavioral health, pointing to variable compatibility and tension for change across the system (Row 4, Table 2/Supplementary Table 2). For example, some staff described having robust screening systems, close communication and collaboration with behavioral health staff, and in-house behavioral health services. In these clinics, staff were concerned about how the BHS+ORCHID would affect their current workflow. In contrast, others described being in clinics with less systematic screening approaches and less communication with behavioral health teams. Staff in these clinics reported less difficulty with integrating the BHS into their workflow (Row 4, Table 2/Supplementary Table 2). Additional facilitators in the inner setting included access to private space, having engaged clinic leaders, and incentives in the form of public recognition at both clinic and system-wide meetings--resources not currently present in all clinics.

Intervention Characteristics

As shown in Table 2, both the BHS and ORCHID were viewed as *adaptable*. However, they were also viewed as being somewhat *complex* and *costly*, with only slight agreement that the BHS+ORCHID had a *relative advantage* compared to existing systems for screening and referrals for mental health treatment. Qualitative data revealed that staff in clinics with weaker screening systems believed that the BHS would help them to better understand, refer, and support their clients, but those in clinics with robust systems were uncertain about what the BHS would add (Row 5, Table 3/Supplementary Table 2). Staff emphasized the need for a flexible implementation process that would allow them to deliver client-centered services and offered suggestions such as screening after the initial intake visit, less frequent screening, or collaborating with on-site behavioral health teams (Row 7, Table 3/Supplementary Table 2). Across interviews, the referral to ORCHID was viewed as similar to making other referrals, suggesting low complexity and good compatibility. Overall, there was high enthusiasm for incorporating ORCHID as a referral option, with many staff noting that an online intervention could help to address the lack of community-based behavioral health services (Row 6, Table 3/Supplemental Table 2).

Characteristics of Individuals

Survey data indicated that MCMs and Supervisors agreed that both the BHS and ORCHID would be effective (see Table 2). Across interviews, most MCMs recognized that they were in a unique position to implement a BHS, as they had close relationships with clients. However, some MCMs perceived that it was outside their role to conduct a BHS and believed that medical/behavioral health clinicians were better qualified, suggesting mixed levels of self-efficacy (Row 8, Table 3/Supplementary Table 2). Some MCMs also had a mental image of an “ideal” client for ORCHID, e.g., someone who did not have high levels of mental health distress. MCMs also were disappointed to learn that ORCHID was only available in English (Row 9, Table 3/Supplementary Table 2). Whereas some MCMs were concerned about guiding clients through the uptake and completion of ORCHID, others were eager to help clients access and complete ORCHID, even offering to sit with their clients and translate the material into Spanish (Row 10, Table 3/Supplementary Table 2).

Process

Key informants had several suggestions for ensuring a successful implementation process (survey items did not assess this domain). All identified interactive trainings with opportunities to ask questions and practice with one another as critical for preparing them to screen and respond appropriately, especially for addressing potential stigma and/or reluctance to engage with mental health services. Importantly, all informants noted that AFC had a strong history of providing engaging training and effective technical support. Both MCMs and Supervisors thought it was important to share high-quality marketing materials across platforms, e.g., pamphlets/brochures distributed at meetings, email, and social media (Row 11, Table 3/Supplementary Table 2). Given variability in screening and referral systems across the RWMCM system, staff also recommended engaging both clinic and behavioral health leaders in the implementation process. Reflecting and evaluating during the implementation process was identified as vital: supervisors recommended folding this into regular team meetings, with data support from AFC, and both groups recommended using a dashboard system to provide direct feedback on BHS reach and fidelity. During implementation, informants also wanted to learn from their colleagues and to share feedback with AFC leaders and the research team (Row 12, Table 3/Supplementary Table 2).

Discussion

Implementation research is critical for supporting the adoption, scale-up, and sustainment of evidence-based interventions in clinical care settings serving PLWH.^{42, 43} Through quantitative and qualitative data, we identified a number of important determinants that will guide the implementation of the BHS+ORCHID. MCMs and supervisors perceived a strong need for additional client services, and the BHS was viewed as a valid tool to screen for clients' behavioral health needs (i.e., high compatibility). Yet MCMs also described potential barriers in the inner and outer settings, including redundancy with some clinic's existing workflows (i.e., low relative advantage and compatibility), limited time and resources to conduct the screening and any needed follow-up (i.e., high human resource costs), and a need to address mental health stigma and clients' immediate resource needs. Whereas ORCHID was viewed as a way to address the lack of immediately accessible

referral options, some informants were concerned about access for clients with technological or linguistic barriers. Nevertheless, staff highlighted strong team cultures as well as training and leadership from AFC on prior initiatives as key predictors of implementation success; they also recommended several strategies to support implementation.

The identified barriers and facilitators are consistent with prior research on the implementation of behavioral health screenings and mHealth interventions in diverse care settings, including primary care clinics,⁴⁴ federally qualified health centers,⁴⁵ and clinics serving people with chronic health conditions. Within the CFIR, implementation readiness is a multidimensional construct that refers to the “tangible and immediate” indicators of an organization’s commitment to the decision to implement a new intervention.³² Both survey and interview data pointed to a strong prior history of AFC leadership engagement, support, training and technical assistance to implement new programs and initiatives within the RWCM, strategies correlated with implementation readiness in prior research.^{32, 46, 47}

In order to address relevant barriers and to strengthen implementation readiness and other facilitators, we selected an initial set of strategies to increase MCM awareness, knowledge, and self-efficacy and to support identified implementation outcomes (see IRLM in Figure 1). During the pre-implementation phase, we will release educational materials in multiple modalities and conduct a series of dynamic trainings. Trainings will include content on behavioral health among PLWH and information on screening and referral procedures. Given identified stigma concerns, trainings also will provide practice opportunities to increase MCM self-efficacy to address client reticence to discuss mental health. We also will identify clinic and system-wide champions who can share their positive experiences during meetings and trainings. Finally, trainings and materials will highlight ORCHID as a complement that may support clients as they wait for other services. Trainings will be provided before and during implementation. During implementation, we will refine and implement quality monitoring tools and systems. These strategies will enable the team to audit and provide feedback on the BHS+ORCHID to each clinic. Following staff recommendations, feedback will be given via a dashboard system that also provides electronic prompts. Technical assistance will be provided, with AFC supporting the BHS and the research team supporting ORCHID. As implementation proceeds in each clinic, the research team will conduct additional mixed-methods research to identify actual barriers and facilitators and to evaluate and adapt strategies as needed.⁴⁸ Figure 1 and Supplementary Table 3 provide a complete list of planned implementation strategies, mapped to ERIC strategies.

Strengths and Limitations

Study strengths include the use of the CFIR to guide data collection and analysis,^{32,49} use of validated CFIR measures,^{35, 36} strong sampling methods, and the sequential mixed-methods study design. However, the study is not without limitations. The scales used to measure CFIR constructs assessed extent of agreement that specific potential barriers and facilitators (e.g., implementation climate) were present^{35–37} but not whether these factors were perceived as being barriers, facilitators, or as not relevant (neutral) to implementing BHS+ORCHID. A different measurement strategy may have yielded different insights

into perceived barriers or facilitators. Future mixed-methods research during the trial will provide additional data on how and whether these determinants operate as actual barriers or facilitators. Although MCMs and supervisors were recruited from across the RWMCM system, not all invitees opted to participate and few provided a reason for declining. It is possible that staff with the most burdensome schedules and/or least interest chose not to participate. Nevertheless, we obtained survey responses from all eligible clinic sites and reached coding saturation after 15 interviews. Lastly, data collection took place between November 2020 and March 2021—a time period when the COVID-19 pandemic likely resulted in changes to practice with long-term implications of these plans being unknown.

We additionally acknowledge that our implementation plans will not ameliorate all barriers for PLWH who could benefit from ORCHID, e.g., structural inequalities, dearth of community-based behavioral health services, technology access, and access for non-English speaking clients. Although we partially address technology access by optimizing ORCHID for mobile device delivery and by suggesting community resources through which clients can regularly access the internet, additional research is needed to adapt ORCHID for non-English speaking persons. Spanish-speaking versions of positive affect interventions have been developed and translation is a high priority for future iterations of ORCHID.⁵⁰ We also do not explicitly intervene at the outer setting level, as would be ideal, due to limitations in project scope and resources. Future research should incorporate health equity frameworks in implementation science research on the outer setting, which may help to improve intervention reach.^{51, 52} We will track variation in outcomes by demographic categories, reasons for unsuccessful screenings of interested study participants, and reasons eligible participants cannot access ORCHID. These data will help to better understand outer setting barriers and may suggest the selection of future implementation strategies to address these barriers.

Conclusions

RWMCM sites are a generally favorable context for implementation of interventions. Identified barriers will be addressed through deploying implementation strategies proposed to impact clinic-and individual-level outcomes, including electronic prompts (reduce complexity), training on ORCHID as a complement to other behavioral health services (increase relative advantage), and feedback during implementation (strengthen rewards/incentives).

*No CFIR ratings provided for process variables, which were not explicitly evaluated during this pre-implementation phase
Notes. CFIR ratings ranged from -2 (strong barrier) to +2 (strong facilitator), with "0" indicating "neutral" and +/- denoting mixed responses. Hypothesized pathways through with the implementation strategies and influence mechanism and outcomes are denoted by superscripts. The outcomes presented in the rightmost column were selected by the team in advance of the present pre-implementation work.

Figure 1.
 Implementation Research Logic Model for BHS+ORCHID

Outer and inner setting characteristics of 16 Ryan White HIV clinics as reported in a survey of medical case management staff

Table 1.

Domain	Endorsement
Outer Setting – i.e., factors exogenous to the implementation setting	
Behavioral Health Needs: How many of your clients do you think struggle with: [1=None to 5=All]	<i>M</i> (<i>SD</i>)
Depression	3.69 (.82)
Anxiety	3.66 (.89)
Substance Use	3.12 (.82)
None	2.00 (.85)
Daily Technology Access (estimate of % clients with each resource)	
Smartphone (<i>n</i> =54)	62.59%
Tablet (<i>n</i> =53)	22.08%
Computer (<i>n</i> =53)	29.62%
None (<i>n</i> =52)	17.69%
Reporting Requirements (<i>n</i> =15, Supervisors only): Is your clinic required to report any of the following to an outside organization (e.g., CDPH, IDPH, HRSA)? [% Yes]	
Doing Behavioral Health Screener	60.00%
Results of Behavioral Health Screener	40.00%
Referrals to Behavioral Health Services	66.70%
Outcomes of Quality Improvement Projects	66.70%
Incentives Present (<i>n</i> =15, Supervisors only) ³	
Public Recognition	26.70%
Payment	6.70%
Positive End-of-Year Score	46.70%
Inner Setting - i.e., factors within the setting of intervention implementation	
Available Resources: would be problematic because we do not have effective referrals or other supportive care resources to care for any more PLWH with behavioral health needs.(Rev)	3.16 (1.21)
Responsiveness to Client Needs: ³⁶ 7 items; $\alpha=.81$ e.g., This team does a good job assessing client needs and expectations.	3.92 (.60)
Overall Culture: ³⁶ 9 items; $\alpha=.89$; e.g., People at all levels openly talk about what is and isn't working.	3.80 (.60)
Culture Stress: ³⁶ 4 items; $\alpha=.85$; e.g., I am under too many pressures to do my job effectively. (Rev)	3.06 (.85)

Domain	Endorsement
Learning Climate; ³⁶ 4 items; $\alpha=.85$; e.g., We regularly take time to consider ways to improve how we do things. ³⁶	3.87 (.68)
Implementation Readiness (leaders); ³⁶ 4 items; $\alpha=.92$ e.g., Leadership strongly supports change efforts. ³⁶	3.83 (.79)
Compatibility1: BHS is compatible and consistent with the behavioral health needs of my clients. ³⁷	3.97 (.46)
Compatibility2: ORCHID is compatible and consistent with the behavioral health needs of my clients. ³⁷	3.69 (.73)
Compatibility3: ORCHID is compatible and consistent with the behavioral health needs of my clients with depression. ³⁷	3.71 (.70)

Notes. $n=58$ unless otherwise noted. For incentives and reporting requirements, percentages reports are the percentage of supervisors who replied Yes. All other variables rated on 1–5 scales; higher values indicate a more positive environment for implementation. Items without a citation were written by study authors.

Abbreviations. Rev=Reverse-scored; higher scores indicate a more positive environment for implementation, (e.g., less stressful work culture)

Intervention Characteristics and Characteristics of Individuals as reported in a survey of medical case management staff at 16 Chicagoland Ryan White HIV clinics.

Table 2.

Domain	M (SD)
Intervention Characteristics	
BHS	
Adaptability: could be administered in a way that is easily adapted to fit the needs of the team. ³⁷	3.84 (.67)
Complexity1: would be easy to understand and use after training. ³⁷	4.00 (.62)
Complexity2: is too complex. ³⁷ (Rev)	3.47 (.88)
Cost1: would take too much time and effort. ³⁷ (Rev)	3.07 (1.06)
Cost2: is something I would only be interested in adopting in the future if funding was provided for it. ³⁷ (Rev)	2.71 (.99)
Relative Advantage1: would be successful in linking clients living with HIV and behavioral health needs to services. ³⁷	3.71 (.84)
Relative Advantage2: is unnecessary because my clinic already screens for behavioral health issues. (Rev)	3.17 (.96)
ORCHID	
Adaptability: would be difficult to adapt to meet the needs of different PLHV populations with behavioral health needs. ³⁷ (Rev)	3.41 (.80)
Cost: would take too much time and effort. ³⁷	3.33 (.85)
Relative Advantage: would be more effective than methods we are currently using to address the behavioral health needs of clients living with HIV. ³⁷	3.09 (.78)
Characteristics of Individuals (Knowledge/Beliefs about Intervention Benefits)	
BHS	
wouldn't really work for my clients, even though it was shown to be effective in other agencies. ³⁷ (Rev)	3.64 (.87)
would be difficult to administer because it is uncomfortable to ask questions about substance use or mental health. ³⁷ (Rev)	3.91 (.88)
would have a visible and substantial impact on the health status of my clients. ³⁷	3.71 (.70)
is something that would benefit clients living with HIV. ³⁷	4.12 (.60)
is problematic because asking about suicidality or depression could trigger these symptoms. ³⁷ (Rev)	4.05 (.83)
ORCHID	
wouldn't really work for my clients, even though it was shown to be effective in research trials. ³⁷ (Rev)	3.55 (.77)
would be less effective at addressing behavioral health needs and improving viral suppression among my clients than it was in the original research studies. ³⁷ (Rev)	3.56 (.73)
<hr/>	
would have a visible and substantial impact on the health status of my clients. ³⁷	3.62 (.64)
Is something that would benefit clients living with HIV. ³⁷	3.97 (.53)

Notes. Items were rated on 1–5 scales with higher values indicating a more positive environment for implementation. Items without a citation were written by study authors. All knowledge/belief items were scored such that higher values indicated more favorable views of the intervention.

Abbreviations. BHS=Behavioral Health Screener; Rev=Reverse-scored item.

Table 3: Illustrative Quotes from In-depth Interviews with Medical Case Managers (MCM: n=9) and Supervisors (SUP: n=6), Chicagoland Ryan White Medical Case Management System

Theme	Select Quotations
High BH Needs and Low Availability of Services	MCM: "...you do encounter waitlists...you've no idea how much longer it'll be between now and them being able to receive the treatment they deserve." MCM: "...it's harder for our Latino population because there's not a lot of people out there that speak Spanish..." SUP: "We'll be referring people to our case managers and right now...every single therapist that we work with is full..."
Client Barriers to Accessing ORCHID	MCM: "...a lot of my clients, they have a phone, they don't have a phone, they have service, they don't have service. Some...are currently jobless...or houseless, because of the pandemic...or even other reasons outside of their control..." MCM: "Some people might take it as an offense. It can be really offensive. 'Why do you offer this to me? I've never asked you. Did I tell you that I need the service? Do I look like I'm crazy?'" MCM: "The barriers with language, will it be in Spanish and English and Russian and Aramaic...? How will that be solved?"
Team Culture	MCM: "We've gotten hit with so many new things within this past year alone that we can just handle it no problem. We try to be as resourceful as we can be. That's a really big value to us...being resourceful, empathetic..." MCM: "We're a really tight team...if we find a problem, we'll talk about it, and then we always reach out to each other, we reach out to our supervisor. I don't think we've seen anything that we're like 'Oh no, we can't do that'..."
Variability in BH screening across clinics	MCM: "We don't have a set screening right now, so it's really just in conversation." MCM: "I offer those resources to them in house here at my clinic. We have a mental health specialist. She and I have been working together. Oftentimes, with client permission, we may do our assessments together initially..."
Relative Advantage of BHS	MCM: "...it seems like it'll give me a wider scope to talk about the different types of assessments...even though I'm not a mental health specialist, this might help me really refine my referrals." MCM: "I think it would just formalize the process. Right now, it's very informal." SUP: "From an agency standpoint, leadership may say, 'Well, why do we need to do that if we already have a screener...?'"
Flexible and adaptable Implementation	MCM: "They're going to react differently...Some people don't care and some...might get kind of insulted...if people have taken it three times, maybe we can go to once a year."
Enthusiasm for ORCHID	MCM: "Well, one, it's self-empowering, so it's... they'll make time for themselves as opposed to having somebody else make time for them... I think that it's very, like I said, empowering people to see what resources they have within themselves to address whatever issues and concerns they have, and needs that they have. I think in that regard, it would definitely be beneficial that they would have that on their own scheduling."
MCM Role Compatibility	MCM: "We have doctors who are there for years and they know patients for years so of course, they know more about them. they know better than us." MCM: "A lot of times we hear a lot of positive feedback from our clients saying, 'Oh wow, even my therapist is not doing this job this good.'"
Perceptions of "ideal" clients	MCM: "I wouldn't refer somebody to [ORCHID] that didn't really have the mental health need. If somebody is in need of these more intense services... with these skills, I feel like the interest would be there."
Implementation expectations and boundaries	MCM: "[A] lot of my clients are Latino and they do have technology issues, but if I see that it's something that's going to help them...I could always help them." SUP: "I will set up time to meet with each of my staff individually to review it after they...practice it. I would actually mandate that they set a specific time, like an hour where they're actually going to sit down and review it"
Training Needs	MCM: "First, [training on] how to initiate these conversations... with our clients, and how to encourage our clients...how to make it simple for them." MCM: "I think more of the background on how [ORCHID] was developed and the fact that it is based in real science, and that there are a lot of other online tools that work for people. This is just going to be another one that, hopefully, probably, will also work."
Recommended strategies	MCM: "Hopefully, there's, like, a support service or something. You know, like, we have problems with AFC, we call AFC. We have a problem with something, we could email you." SUP: "Training for the case managers on start to finish, from screener to all the things involved with ORCHID. And then, release good marketing materials, so the case managers have language around why it would benefit their clients."
