

Supplementary Figure S5

Supplementary Figure S5. BM angiogenesis in tumor-free and MM-bearing mice treated with TQ. DP42 tumors were established in syngeneic mice by i.v. injection of tumor cells. Treatment with TQ started on day 3 after tumor cell injection. BM angiogenesis was determined on day 19 by staining BM sections with anti-CD31 Ab. Slides were scanned and analyzed using Aperio software. Representative images (left) and quantitation (right) are shown. Scale bars, 10µm. Statistics: ANOVA with Tukey’s multiple comparisons test.
