Supplemental Tables

Table S1: Summary of the pK_a's of the WT and H172Y mutant SARS-CoV-2 Mpros calculated from the CpHMD titration simulations[a]

Residue	WT Mpro 6y2g(A)	6y2g(B)	H172Y Mpro 7vh8(A)	7vh8(B)
H41	6.6	6.7	6.6	6.2
H64	6.1	6.1	6.2	6.1
H80	6.3	6.2	6.1	6.0
H163	neutral[b]	neutral	neutral	neutral
H164	neutral	neutral	neutral	neutral
H172	6.6	6.6	N/A[c]	N/A
H246	~4.3[d]	~4.9	5.4	5.0
C16	neutral	neutral	neutral	neutral
C22	7.5	6.8	neutral	~7.3
C38	neutral	neutral	neutral	neutral
C44	7.0	9.2	~7.1	~7.7
C85	~9.5	~9.0	~9.2	neutral
C117	neutral	~9.2	neutral	neutral
C128	~9.4	~9.1	~9.4	~8.9
C145	neutral	~9.4	neutral	~9.3
C156	neutral	neutral	~8.3	~8.8
C160	neutral	neutral	neutral	neutral
C265	neutral	neutral	neutral	neutral
C300	8.4	neutral	neutral	neutral

[a] The pK_a's of both protomers are listed here. The results of the WT Mpro are taken from our previous paper.[S1] Simulations of the H172Y mutant were initiated using the computationally mutated H172 mutant structure based on the X-ray structure of the WT Mpro (PDB id 7vh8,[S2] ligand removed). The entire simulation time (30 ns per pH replica) was used for calculation of the protonation fractions. [b] For histidines, neutral indicates that the residue remains in the singly protonated state (i.e., charge neutral) in the entire simulation pH range. For cysteines, neutral indicates that the residue remains in the protonated state (i.e., charge neutral) in the entire simulation pH range. [c] N/A indicates H172 does not exist. [d] ~ indicates that due to the incomplete titration (in the simulation pH range) the calculated pK_a is approximate.

Table S2: Summary of the computational studies performed in this work

Protein	PDB ID	Set up	Simulation time
Replica-exchange CpHMD[S3]			
H172Y	modeled[a]	ligand free	30 ns x 9
Fixed-protonation state MD[S4]			
WT	7vh8	ligand free	2 μs x 3
WT	7vh8	nirmatrelvir bound[b]	2 μs x 2
H172Y	modeled[a]	ligand free	2 μs x 3
H172Y	unpublished (Hilgenfeld group)	ligand-free	2 μs x 1
H172Y	modeled[a]	nirmatrelvir bound[b]	2 μs x 2
Alchemical free energy perturbation[S5–S7]			
WT$\rightarrow$H172Y	7vh8[c]	nirmatrelvir bound[b]	24 ns[e] $\times$ 2
WT$\rightarrow$H172Y	7vh8[c]	ligand free[d]	24 ns[e] $\times$ 2
H172Y$\rightarrow$WT	modeled[d]	nirmatrelvir bound[b]	24 ns[e] $\times$ 2
H172Y$\rightarrow$WT	modeled[d]	ligand free	24 ns[e] $\times$ 2

Protein	PDB ID	Set up	Num. of repeats
Empirical protein stability calculations with Rosetta ddG_monomer[S8]			
WT	7vh8	ligand free	50
H172Y	modeled[f]	ligand free	50
Empirical binding free energy calculations with Rosetta flex ddG[S9]			
WT$\rightarrow$ H172Y[g]	7vh8	free or ligand bound	40
H172Y$\rightarrow$WT[g]	modeled[a]	free or ligand bound	40

[a]The H172Y mutation was introduced using Modeller[S10] to the X-ray structure of the WT Mpro in complex with nirmatrelvir (PDB id 7vh8)[S2] as the template. [b]The PDB entry 7vh8[S2] contains the structures of WT Mpro-nirmatrelvir complex in both the covalent and noncovalent binding modes. The latter was used as the starting structure of the simulations. [c]The dual topology hybrid molecule (H172/Y172) was created following 50-ns equilibration simulation of the WT or H172Y Mpro. [d]Mutant structure was built using VMD[S11] based on the WT Mpro structure (PDB id 7vh8).[S2] [e]Sampling time includes the 12-ns forward and backward transformations. [f]Generated by the Rosetta ddG_monomer program.[S8] [g]Mutation introduced by the Rosetta flex ddG program.[S9]

Table S3: Summary of relevant distances in the X-ray structure of WT Mpro and in the newly reported X-ray structures of the H172Y Mpro[a]

Mpro Ligand	7vh8 (WT)[S2] nirmatrelvir	8d4j (H172Y)[S12] free	8d4k (H172Y)[S12] GC-376
F140–H163	3.7	3.8/3.8	3.7/3.7
F140:N–Y172:OH	n/a	3.5/3.6	3.3/3.3
Y172:OH–S1*:N	n/a	4.1/4.4	n/d
H172:ND1/NE2–S1*:O	3.1	n/a	n/a
E166:OE1/2–S1*:N	2.8	4.3/3.3	n/d
F140:O–S1*:N	2.8	6.5/6.5	n/d
G138:CA–S144:CA	10.9	11.1	11.1
G138:CA–T135:CA	9.0	9.2	9.5

[a]All distances are in unit Å. F140–H163 refers to the distance between the center-of-mass (COM) of the aromatic rings of Phe140 and His163. The PDB entry 7vh8, the WT Mpro is in complex with nirmatrelvir. In the PDB entry 8d4k, the coordinates of Ser1 are not resolved; thus, distances involving S1 are listed as n/d. 8d4j: ligand free H172Y Mpro. 8d4k: H172Y Mpro in complex with a covalent inhibitor GC-376.

Table S4: Five distances that most correlate with the frame label (i.e. apo or holo) for both Diffnet models. Pairwise distances were calculated between alpha carbons within 15 Å of the alpha carbon of H/Y172, using the centroid frame of each cluster (200 total) after clustering on the latent space.

Apo

Residue:Chain	Residue:Chain	Correlation w/ predicted label
Gly138:B	Thr135:B	0.9043
Gly138:B	Asn133:B	0.8756
Gly138:B	Phe134:B	0.8661
Gln127:B	Ala129:B	0.8427
Phe181:B	Phe3:B	0.8356

Holo

| Residue:Chain	Residue:Chain	Correlation w/ predicted label
Gly138:A	Gly143:A	0.9257
Gly138:A	Ser144:A	0.9073
Glu166:A	Ala173:A	0.9017
Asn142:A	Gly138:A	0.8802
Phe112:B	Phe3:B	0.8700

Supplemental Figures

Figure S1: **The overall RMSD of H172Y Mpro in Run 1 and 2 of the free and nirmatrelvir-bound H172Y Mpro.** Heavy-atom root-mean-square deviation (RMSD) of the ligand-free (a, b, c) and nirmatrelvir bound (d, e) H172Y Mpros with respect to the mutant model as a function of simulation time. Simulation runs 1 and 2 are shown on the left and center panels, respectively, while the third free simulation is shown on the right.
Figure S2: **Nirmatrelvir was stably bound in the WT and H172Y Mpros during the simulations.** (a, b) Time series of the RMSD of nirmatrelvir in the WT Mpro with respect to the crystal structure (PDB id 7vh8) in the simulation run 1 (a) and 2 (b). (c, d) Time series of the RMSD of nirmatrelvir in the H172Y Mpro with respect to the mutant model in the simulation run 1 (c) and 2 (d).
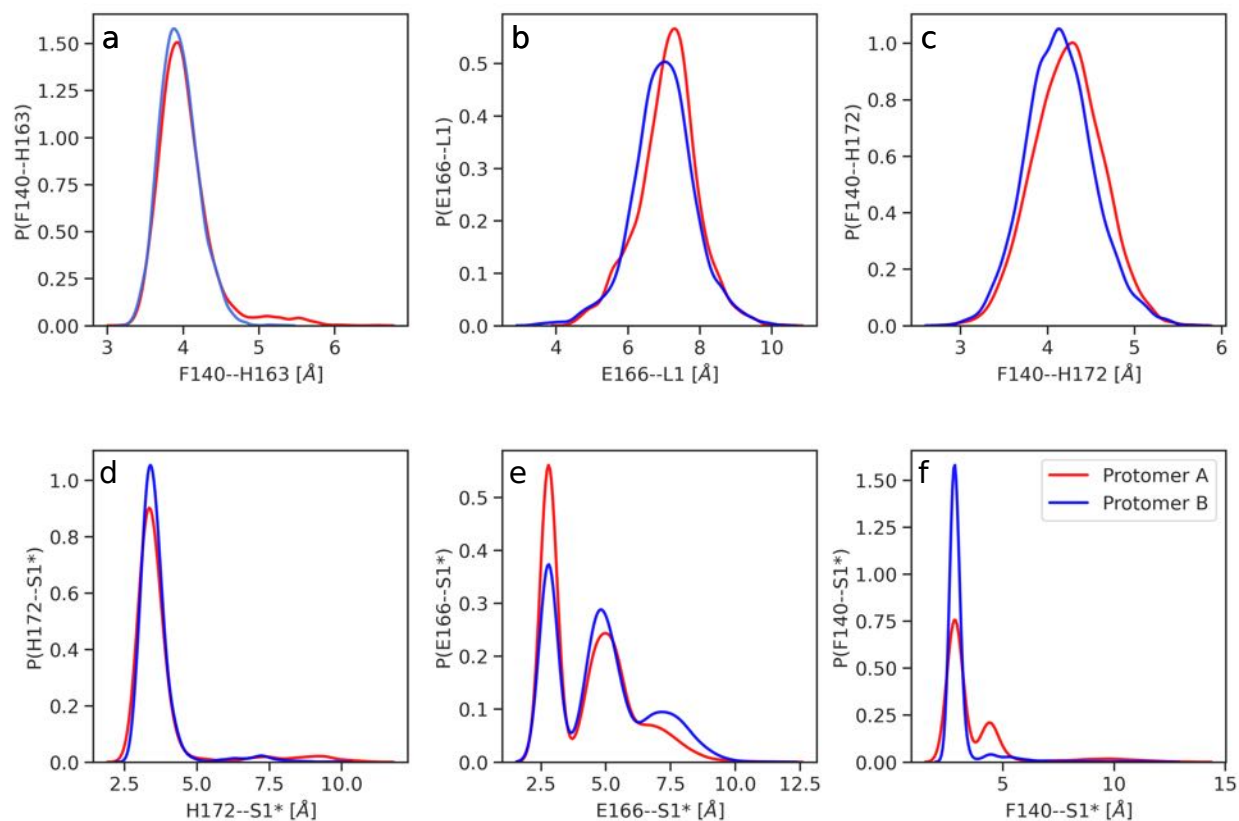

Figure S3: **Probability distributions of the distances involving the S1 pocket residues in the free WT Mpro.** Distributions of the distance (a) between the center-of-mass (COM) of the aromatic rings of Phe140 and His163; (b) between the COM of the carboxylate oxygens of Glu166 and Cα atoms of residues L1; (c) between the amide nitrogen of Phe140 and the hydroxyl oxygen of His172; (d) between the backbone carbonyl oxygen of S1* and the nearest imidazole nitrogen of His172; (e) between the amino nitrogen of Ser1* and the nearest carboxylate oxygen of Glu166. (f) between the backbone carbonyl oxygen of Phe140 and the amino nitrogen of Ser1*. The red and blue curves represent protomer A and B, respectively. The calculations used the data from both simulation runs of the free WT Mpro. The most probable (peak) distances were used as references in the analysis of the H172Y Mpro simulations.
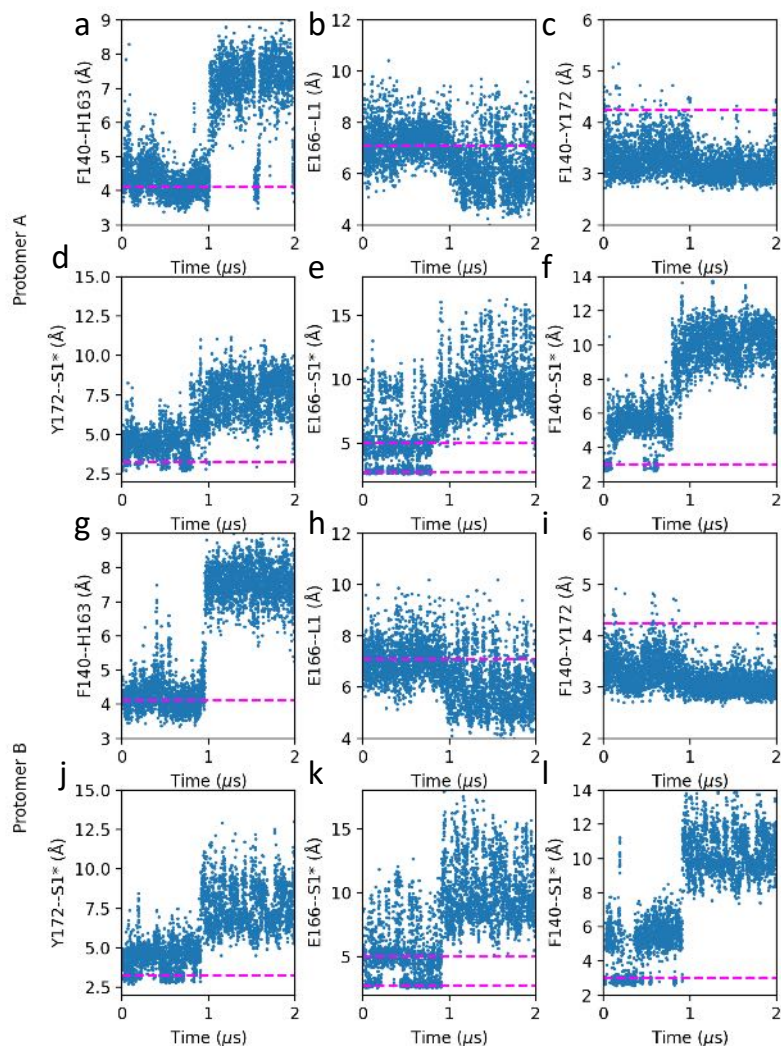

Figure S4: **Run 1 of the ligand-free H172Y Mpro: the S1 pocket–Ser1* interactions and the Phe140–His163 stacking are disrupted.** Distributions of the distances between the center-of-mass (COM) of the aromatic rings of Phe140 and His163 (a); between the COM of the carboxylate oxygens of Glu166 and Cα atoms of L1 (b); between the amide nitrogen of Phe140 and the hydroxyl oxygen of Tyr172 (c); between the amino nitrogen of Ser1* and the hydroxyl group of Tyr172 (d); the nearest carboxylate oxygen of Glu166 (e); or the backbone carbonyl oxygen of Phe140 (f). The magenta lines represent the most probable distances sampled by the free WT Mpro.
Figure S5: **Run 2 of the free H172Y Mpro: the S1 pocket–Ser1* interactions are disrupted and the Phe140–His163 is unstable in both protomers.** Distributions of the distances between the center-of-mass (COM) of the aromatic rings of Phe140 and His163 (a,g); between the COM of the carboxylate oxygens of Glu166 and $C\alpha$ atoms of L1 (b,h); between the amide nitrogen of Phe140 and the hydroxyl oxygen of Tyr172 (c,i); between the amino nitrogen of Ser1* and the hydroxyl group of Tyr172 (d,j); the nearest carboxylate oxygen of Glu166 (e,k); or the backbone carbonyl oxygen of Phe140 (f,i). The magenta lines represent the most probable distances sampled by the free WT Mpro.
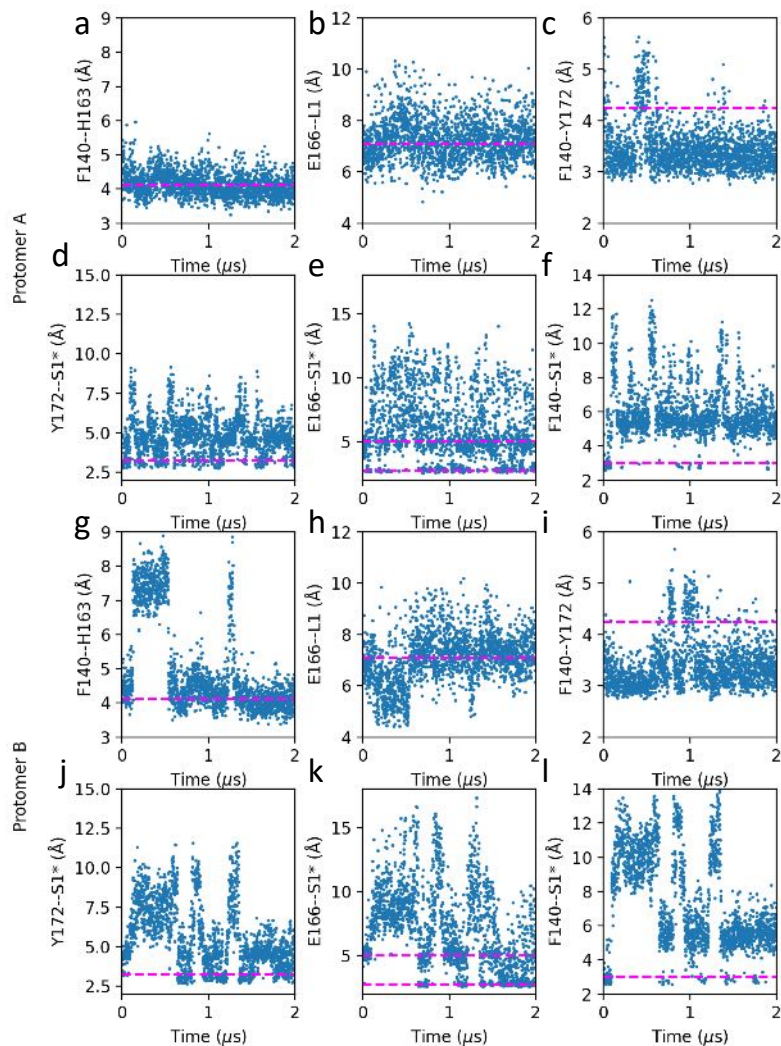

Figure S6: **Run 3 of the free H172Y Mpro: the S1 pocket–Ser1* interactions are disrupted and the His163-Phe140 stacking in protomer B is unstable.** Distributions of the distances between the center-of-mass (COM) of the aromatic rings of Phe140 and His163 (a,g); between the COM of the carboxylate oxygens of Glu166 and Cα atoms of L1 (b,h); between the amide nitrogen of Phe140 and the hydroxyl oxygen of Tyr172 (c,i); between the amino nitrogen of Ser1* and the hydroxyl group of Tyr172 (d,j); the nearest carboxylate oxygen of Glu166 (e,k); or the backbone carbonyl oxygen of Phe140 (f,i).
Figure S7: **H172Y causes a shift between His163 and Phe140 that can disrupt stacking.** Probability distributions for the distance between the COM of aromatic rings of Phe140 and His163 for ligand-free trajectories after removing the first 1 μ. The distribution from each trajectory is shown as separate lines, colored according to the system (WT or mutant), separated by monomer.
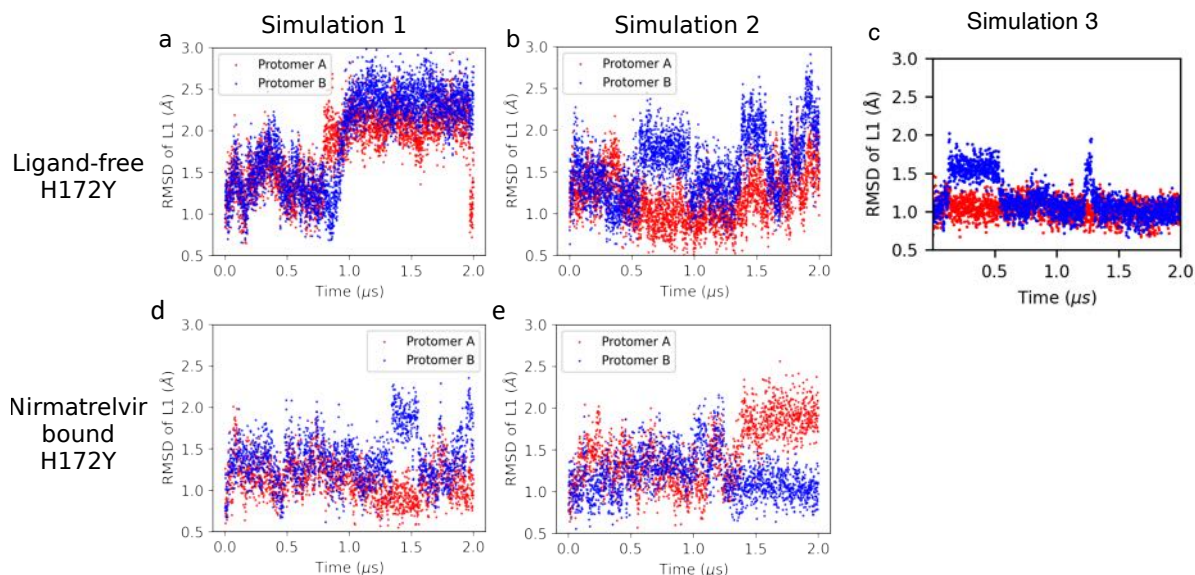

Figure S8: **Stability of the oxyanion loop in the simulations of the free and nirmatrelvir-bound H172Y Mpro.** Heavy-atom RMSD of the Mpro oxyanion loop (residues 138-145, L1) with respect to the to the mutant model as a function of simulation time in the ligand-free (a, b) and nirmatrelvir bound H172Y (c, d) Mpros. Simulation runs 1 and 2 are shown on the left and right panels, respectively. Run 3 is shown on the bottom.

Figure S9: **Run 1 of the ligand-free H172Y Mpro: Occupancy of the nonnative hydrogen bond between amide nitrogen of Phe140 and the hydroxyl oxygen of Tyr172.** The occupancy was calculated for the first 0.5 μs (dark blue) and last 0.5 μs of the 2-μs simulation.
Figure S10: **Formation of the nonnative Y172-F140 hydrogen bond may be correlated with the loss of aromatic stacking in the free H172Y Mpro. a.** A representative structure (cluster centroid) was taken from the clustering analysis of the last 1-μs trajectory. A zoomed-in view of the S1 pocket shows a nonnative hydrogen bond between the hydroxyl group of Tyr172 and the backbone amide of Phe140, the complete loss of aromatic stacking between His163 and Phe140 and the N terminus interaction with Glu166. The Y172:O–F140:N and E166:OE1/OE2–S1*:N distances are indicated. **b.** Probability density as a function of the F140–H163 and F140–Y172 distances from the last 1-μs trajectory. Analysis here uses the data of protomer A from the simulation run 1 of the free H172Y Mpro simulations. **b.**
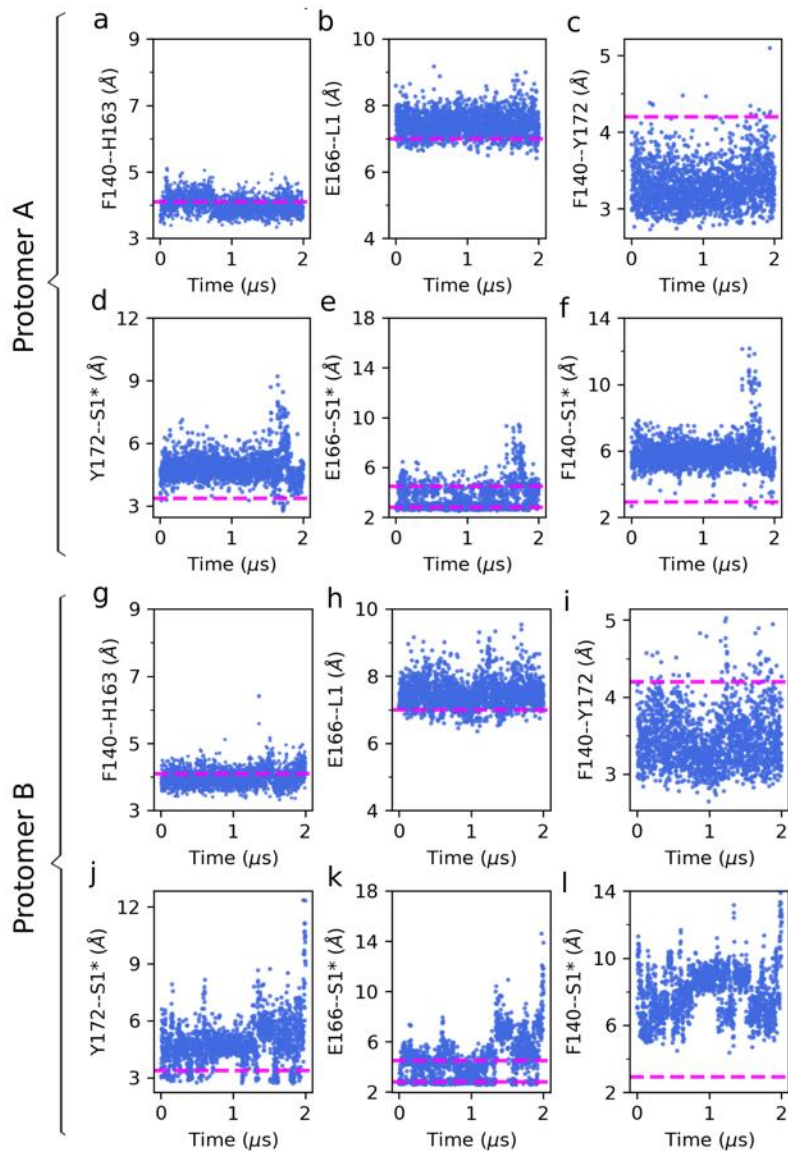

dfd

Figure S11: **Run 1 of the nirmatrelvir bound H172Y Mpro: the S1 pocket–Ser1* interactions were disrupted.** (a, g) Distance between the COM of the aromatic rings of Phe140 and His163 in protomer A (a) and B (g). (b, h) Distance between the center of mass (COM) of the carboxylate oxygens of Glu166 and that of the oxyanion loop (Cα atoms of residues 138-145) in protomer A (b) and B (h). (c, i) Distance between the amide nitrogen of Phe140 and the hydroxyl oxygen of Tyr172 in protomer A (c) and B (i). (d, j) Distance between the hydroxyl group of Tyr172 and the N-terminus amino nitrogen in the opposite protomer (Ser1*). (e, k) Distance between the nearest carboxylate oxygen of Glu166B and the amino nitrogen of Ser1*. (f, l) Distance between the backbone carbonyl oxygen of Phe140 and the amino nitrogen of Ser1*. The magenta dashed lines in the plots represent the average distances sampled by WT simulations.

S-16
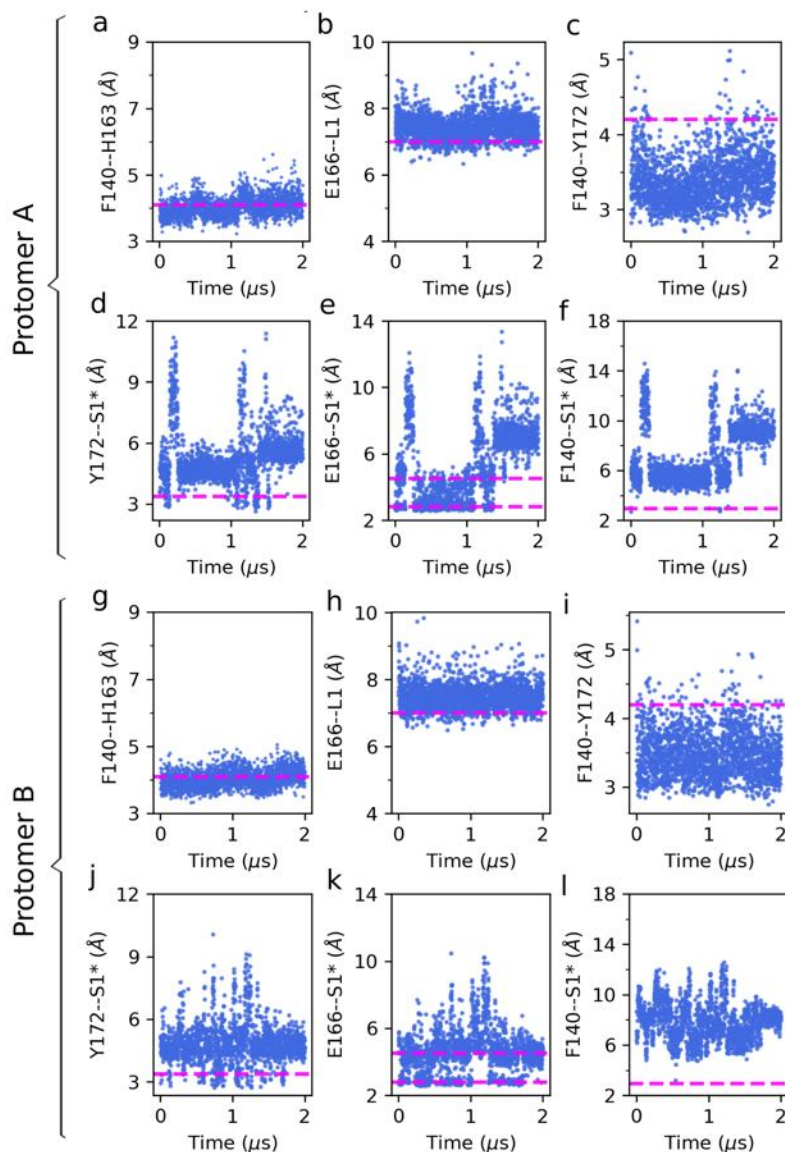

Figure S12: **Run 2 of the nirmatrelvir bound H172Y Mpro: the S1 pocket – Ser1***
interactions were disrupted. (a, g) Distance between the COM of the aromatic rings
of Phe140 and His163 in protomer A (a) and B (g). (b, h) Distance between the center
of mass (COM) of the carboxylate oxygens of Glu166 and that of the oxyanion loop (Cα
atoms of residues 138–145) in protomer A (b) and B (h). (c, i) Distance between the
amide nitrogen of Phe140 and the hydroxyl oxygen of Tyr172 in protomer A (c) and B (i).
(d, j) Distance between the hydroxyl group of Tyr172 and the amino nitrogen of Ser1*. (e,
k) Distance between the nearest carboxylate oxygen of Glu166B and the amino nitrogen
of Ser1*. (f, l) Distance between the backbone carbonyl oxygen of Phe140 and the amino
nitrogen of Ser1*. The magenta dashed lines in the plots represent the average distances
sampled by WT simulations.

Figure S13: **Binding interactions between nirmatrelvir and Mpro are affected by the H172Y mutation.** (a) Probability distributions of the heavy atom RMSD of nirmatrelvir in the WT (magenta) and H172Y (blue) Mpros with respect to the X-ray structure (PDB id 7vh8). Data from both simulation runs were used. b) A zoomed-in view of the nirmatrelvir binding site in the WT Mpro. (c) Occupancies of the hydrogen bonds between nirmatrelvir and Mpro atoms in the WT (magenta) and H172Y (blue) Mpros. The data from the last 1 μs of both simulation runs were used. (d) A zoomed-in view of the nirmatrelvir binding site in the H172Y Mpro based on the representative (clustering centroid) structure. A nonnative hydrogen bond is formed between the backbone of Phe140 and sidechain of Tyr172. The hydrogen bond betwen the lactam N13 and Glu166 carboxylate oxygen is missing. Instead, a hydrogen bond between N13 and the backbone carbonyl of Phe140 is formed.
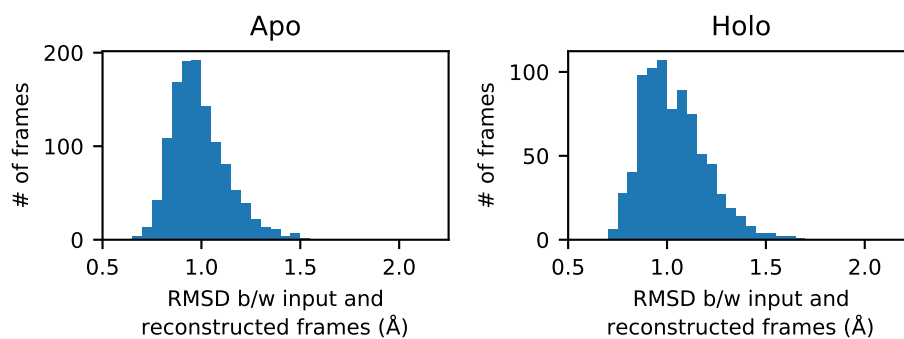

Figure S14: **Created diffnets are capable of reproducing the input frame after encoding onto the latent space.** Performance evaluation of diffnets trained on apo (left) and holo (right) trajectories. The RMSD between the input (i.e. frame from an MD trajectory) and the reconstructed frames (i.e. frame created by the decoder). Both models are adept at reconstructing the input positions, with RMSD between input and reconstruction ranging from 0.6 and 1.7 Å.
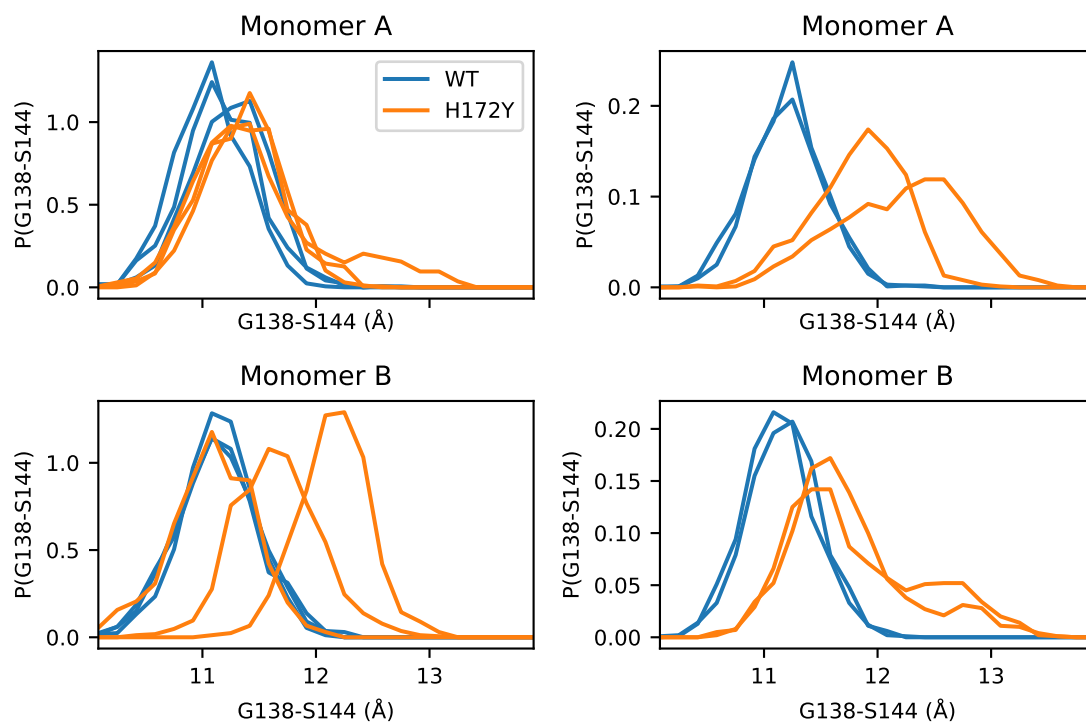

Figure S15: **H172Y induces conformational changes to the oxyanion loop in both the apo and holo trajectories.** Probability distributions for the distance between Cα atoms of G138 and S144 (one residue before the last residue in the oxyanion loop). The distribution from each trajectory is shown as a separate line, colored according to WT or mutant, separated by system (apo or holo) and by monomer.

Figure S16: **H172Y induces conformational changes to the region preceding the oxyanion loop in both apo and holo trajectories.** Probability distributions for the distance between alpha carbons of residues preceding the oxyanion loop, G138 and T135. The distribution from each trajectory is shown as a separate line, colored according to WT or mutation, separated by system (apo or holo) and by monomer.
