

Supplementary Figure 1. Detection of anti-VWF immunoglobulin.

Anti-VWF immunoglobulin (Ig) in the patient's sample (black circles; depicted as an amount equivalent to undiluted volume) was detected by using anti-human Ig (common for IgG, IgM and IgA) as a detecting antibody and purified VWF (200 ng/well) coated on a 96-well plate in a sandwich-enzyme-linked immunosorbent assay (ELISA).
