### **Live-cell imaging of HUVEC**

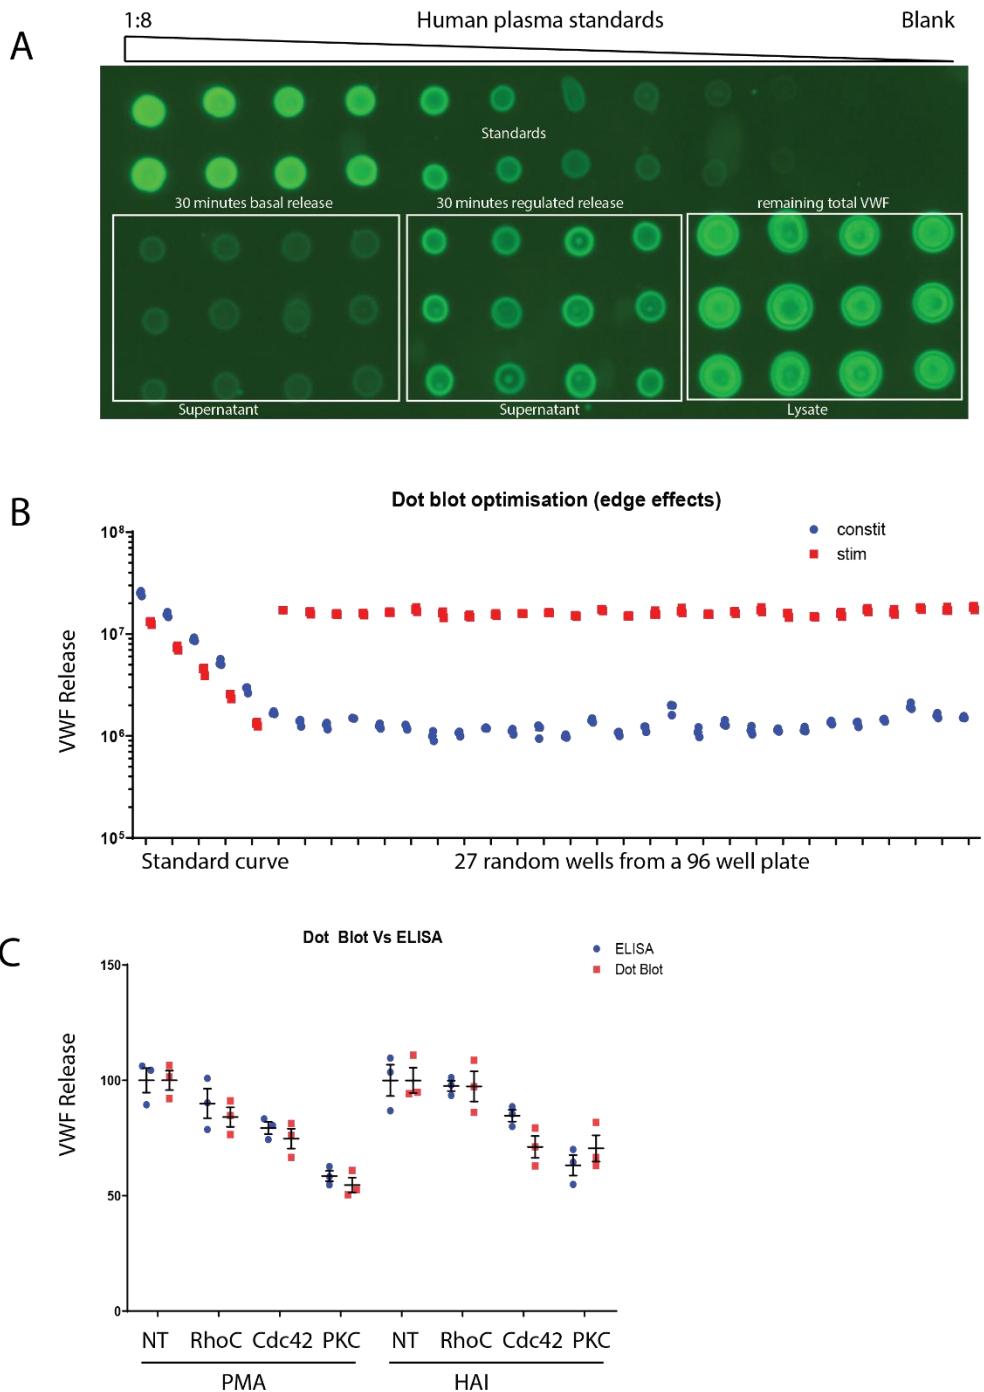

For imaging septin dynamics  $1 \times 10^6$  cells were transfected with 3 µg of SEPT6-eGFP P.sel.lum.mCherry and seeded into four compartment cell viewing dishes. 48 hours later cells were stimulated with PMA (100 ng/mL) and continuous Z-stack (0.5-6 µm steps) images acquired using a Zeiss LSM 800 confocal microscope (63X objective lens). The same procedure

was followed for imaging actin dynamics with the following exceptions. 3 µg of LifeAct-GFP was used in combination with P.sel.lum.mCherry and cells were imaged 24 hours after nucleofection. For inhibitor studies cells were pre-incubated in 1 µM of FRAX486 or 50 µM FCF for at least 30 minutes.

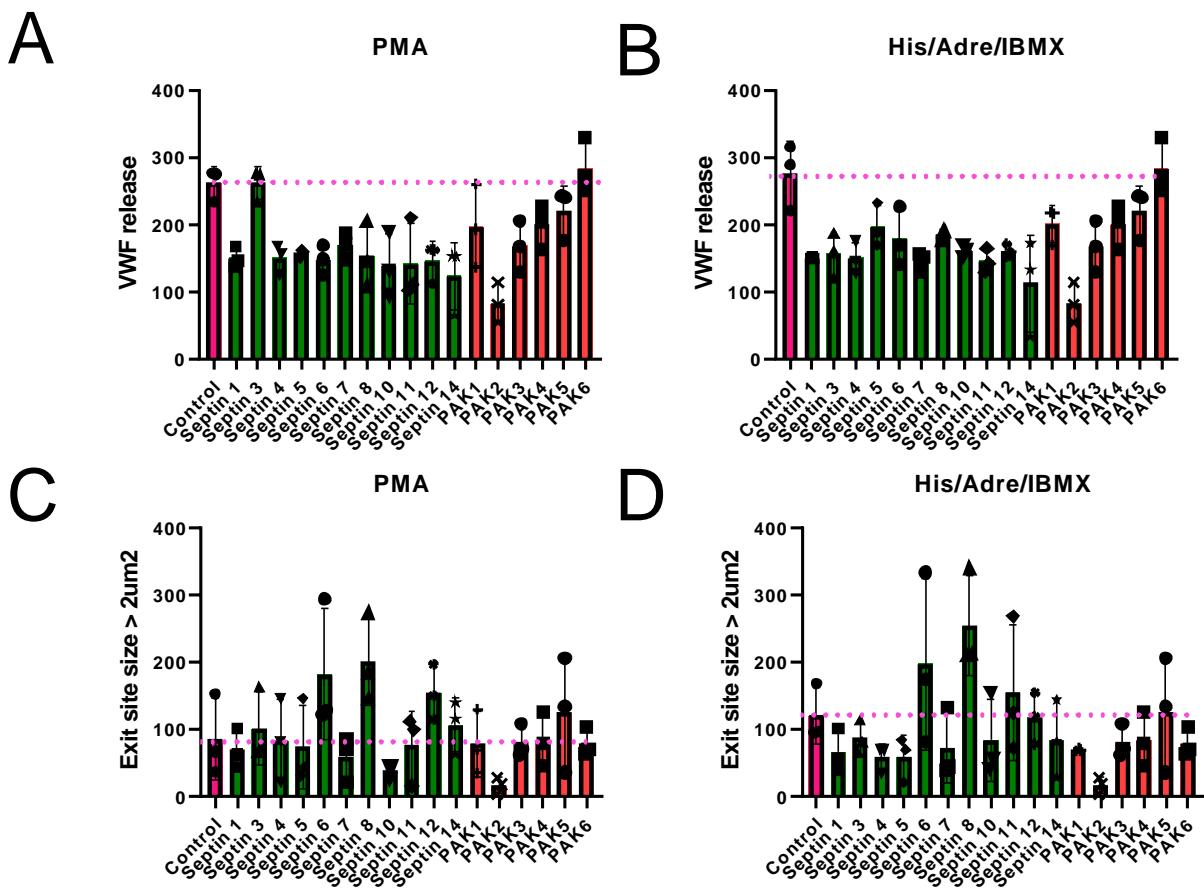

Defining the exact timings of septin ring recruitment was particularly challenging because in our experimental conditions, fluorescently tagged septin subunits only incorporate in the hetero-oligomers following a transient burst of expression. This is because recombinant septins do not immediately incorporate into the pre-existing septin filaments but require *de novo* assembly of hetero-oligomers (Sellin et al., 2011). Further, increased expression level and ability to form homopolymers resulted in lentiviral-derived SEPT7-mCherry aggregating into thick amyloid-like filaments. The only way to image septin ring formation in live endothelial cells was to incorporate eGFP tagged monomers into the heterooligomeric rings during formation. SEPT6 is the only septin that we managed to image at exocytosis in live cells (endogenous SEPT7 is present on SEPT6-eGFP rings, as observed using fixed cells). There remains the possibility that septin ring function in cells expressing sufficient SEPT6-eGFP are perturbed in some manner in terms of dynamics and function. The impact of SEPT6 depletion on exit site size was the opposite to SEPT7, indicating that SEPT6 may play alternate or redundant roles in exocytosis. This may explain why SEPT6 is suitable candidate for allowing septin ring imaging. Despite this, we can conclude that SEPT2/6/7/9 rings are recruited post fusion and have an important role in VWF exocytosis through aiding efficient functioning of the actomyosin ring.

## Supplementary Figures

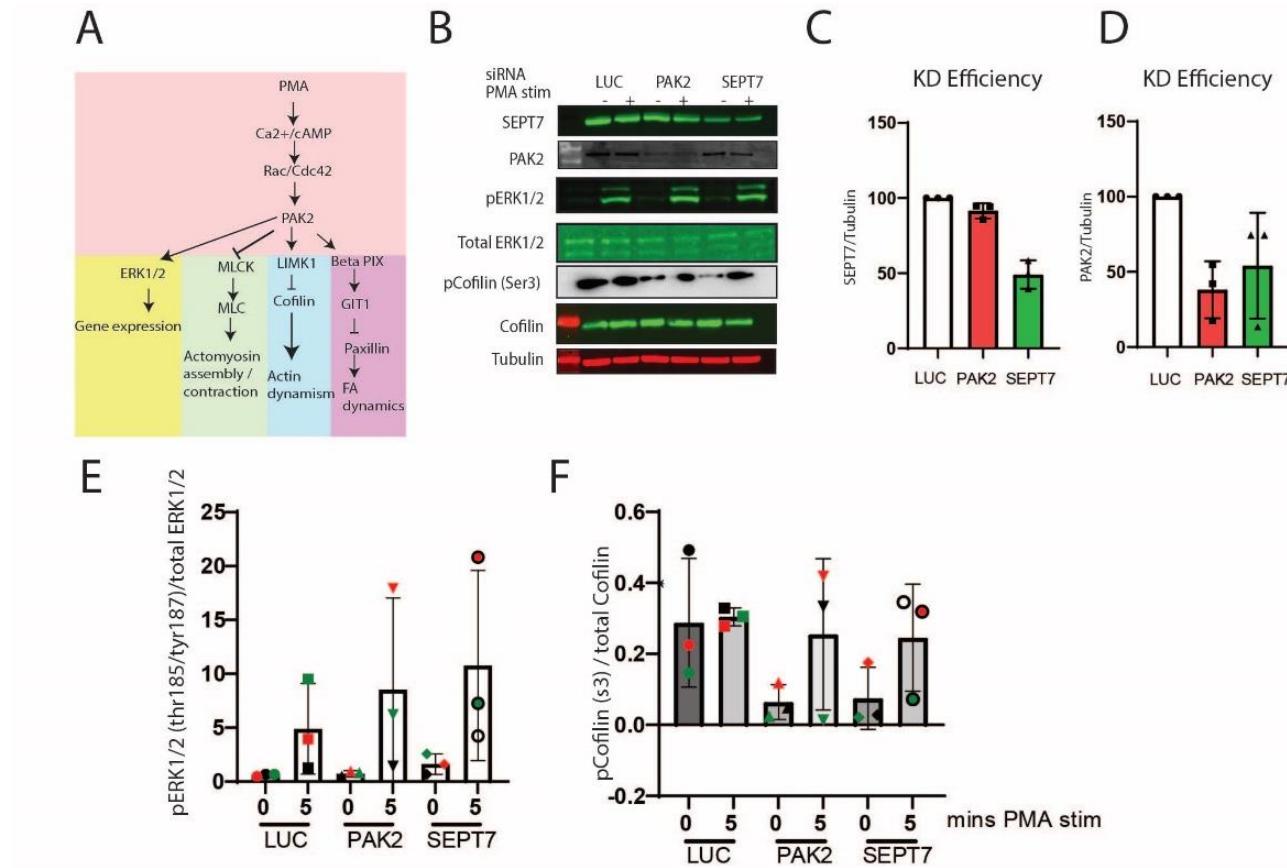

**Fig. S1. Optimization of the fluorescent dot blot.** **(A)** Example blot. VWF was detected with an anti-VWF antibody, signal amplified using a biotin conjugated antibody and 800 IRDye labelled streptavidin. **(B)** No edge effects were determined **(C)** No significant differences were detected when the fluorescent dot blot was compared to a conventional VWF ELISA.

**Fig. S2 The effect of siRNA mediated depletion of PAK isoforms and Septin paralogs on VWF release and exit site size** The transfected cells were stimulated with PMA (A/C) or a combination of Histamine/Adrenalin/IBMX (B/D) and either fixed in the presence of VWF antibody for analysis by confocal microscopy to determine exit site size (C/D) or the supernatants taken to determine the amount of VWF secreted by fluorescent dot blot analysis (A/B).

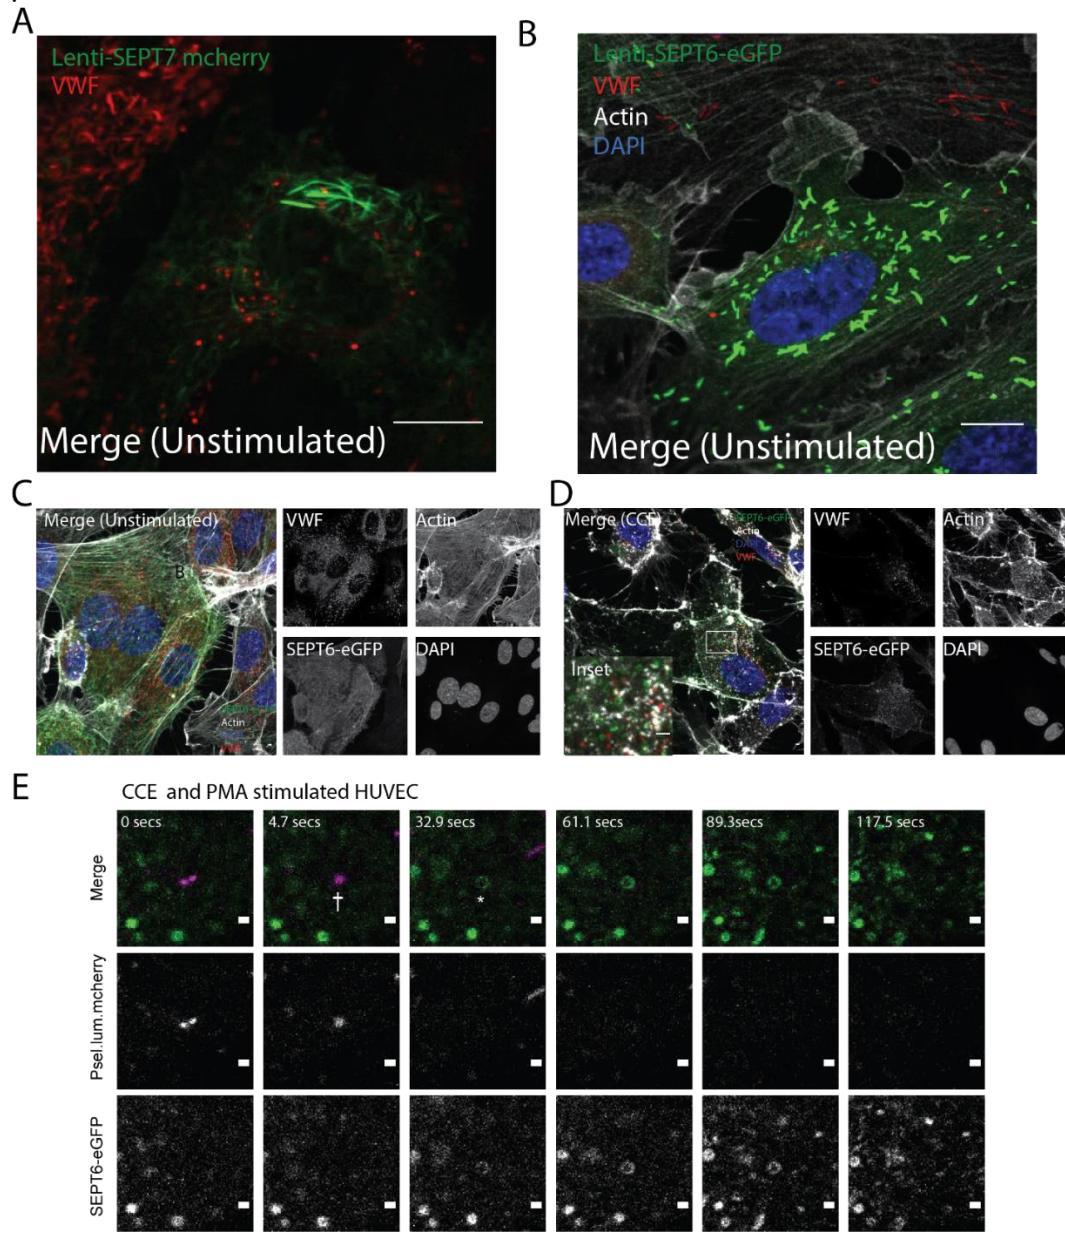

**Fig. S3. The effect of PAK2 silencing on VWF release is not mediated by ERK1/2 or cofilin activity.** (A) Schematic of known PAK2 signalling pathways (B) PAK2 and SEPT7 expression was silenced using siRNA oligonucleotides and cell lysates probed for SEPT7, PAK2, tubulin, ERK1/2, phosphor-ERK1/2 (thr185/tyr187), cofilin and phospho-cofilin (s3) (C-D) Knock down efficiency of SEPT7 and PAK2 siRNA as determined by densitometry. (E) PAK2 KD and SEPT7 KD does not inhibit PMA stimulated ERK1/2 phosphorylation at thr185/tyr187 residues. (F) Less phosphor-cofilin (s3) was detected in PAK2 and SEPT7 KD lysates under basal conditions. PAK2 KD and SEPT7 KD does not inhibit PMA stimulated cofilin phosphorylation at s3.

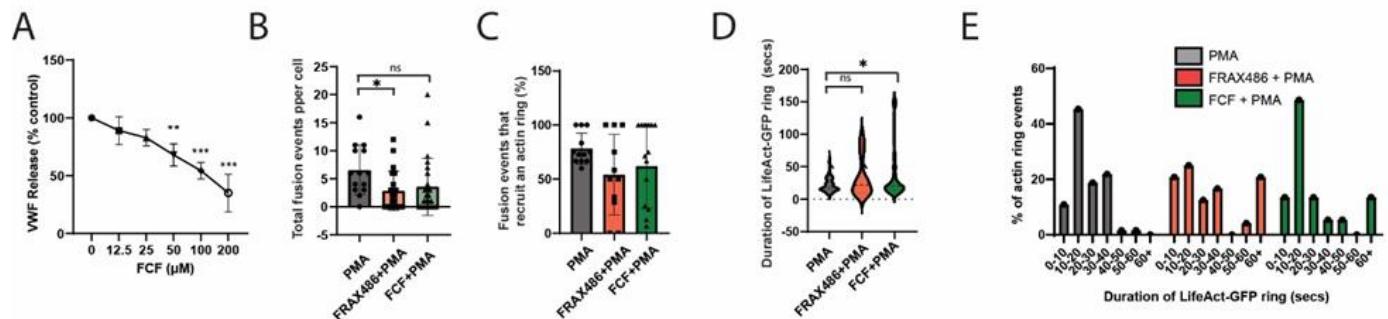

**Fig. S4. Optimization of imaging fluorescently tagged septin subunits in endothelial cells**

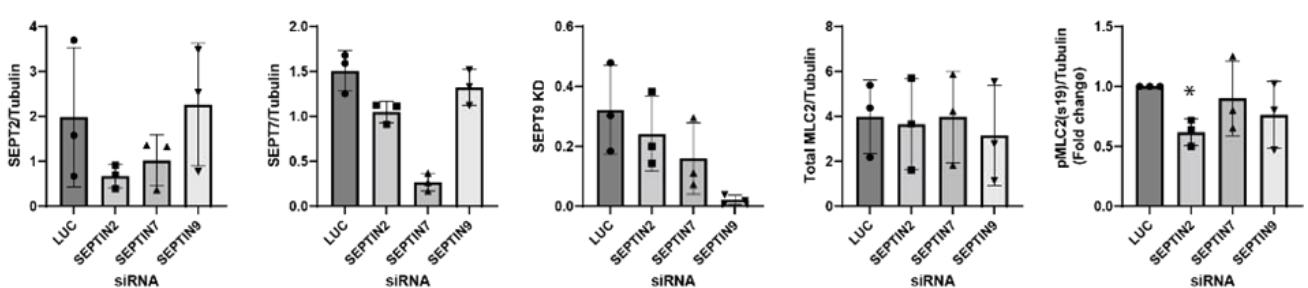

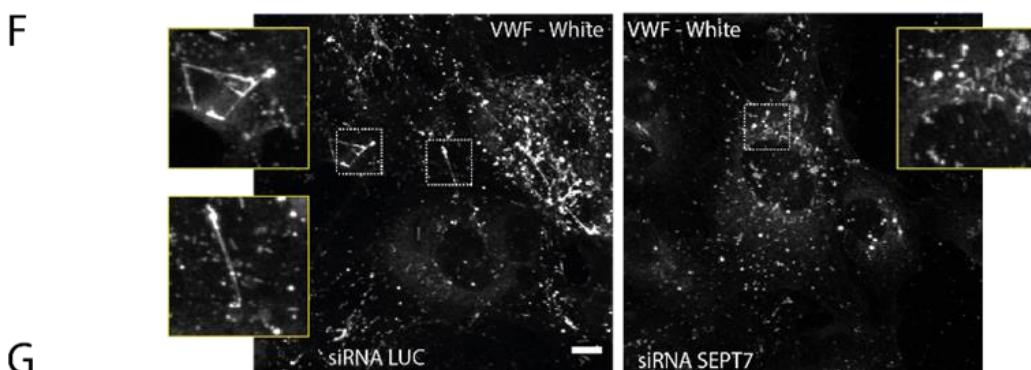

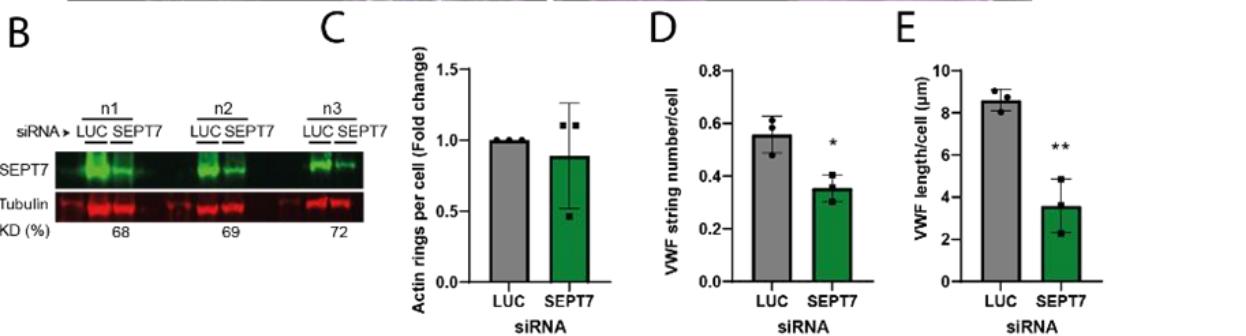

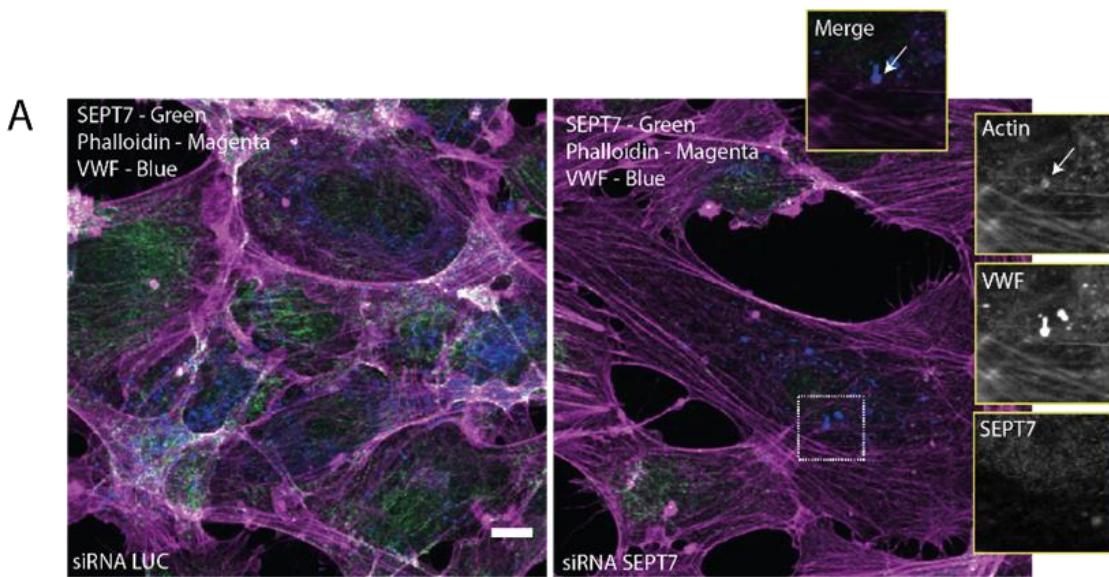

(A) Lentiviral-derived SEPT7-mCherry forms thick filaments, uncharacteristic of the endogenous staining. (B) Lentiviral derived SEPT6-eGFP forms thick aggregates. (C) Imaging of plasmid transfected (eGFP-SEPT6) 48 hours after a transient burst of expression illustrates cytoskeletal-like staining of eGFP-SEPT6 (green) and colocalisation with actin (white). (D) eGFP-SEPT6 behaves like the endogenous protein, forming rings in response to actin polymerisation with CCE. All scale bars are 10  $\mu$ m. (E) Live cell confocal imaging of HUVEC transfected with eGFP-SEPT6 (green) and P.sel.lum.mCherry (magenta) prior to stimulation with PMA (100 ng/mL) in the presence of the actin poison, cytochalasin E (1  $\mu$ M). Scale bar 1  $\mu$ m.

**Fig. S5 Pharmacological regulation of PAK2 and SEPT7 perturbs actin ring kinetics during WPB exocytosis** (A) HUVEC were exposed to increasing concentration of the septin stabilising small molecule, FCF. FCF inhibited VWF release in a dose dependent fashion. One way ANOVA with Dunnett's post hoc test. (B) WPB fusion was quantified by change in morphology (rod>round) and loss of mCherry signal. HUVEC were pre-treated with low dose concentrations of FRAX486 (1  $\mu$ M) and FCF (50  $\mu$ M) for 30 minutes before stimulation with PMA (100 ng/mL). The pan-PAK inhibitor FRAX486 reduced WPB fusion events (\* $p<0.05$ ), while FCF had no effect (ns= $p>0.05$ ). One way ANOVA with Dunnett's post hoc test (C) Quantification of WPB fusion events in which LifeAct-GFP was recruited as a ring. (D) Quantification of the duration of LifeAct-GFP signal encapsulating fused WPBs. Control: 64 events from 13 cells. FRAX486: 24 events from 18 cells. FCF: 37 events 23 cells. (\* $p<0.05$ ) One way ANOVA with Dunnett's post hoc test. (E) Frequency distribution of the duration of actin ring dependent exocytic events. In control cells, every event lasted less than 60 secs. Inhibition of septin and PAK2 resulted in some events lasting as long as 160s and 100s respectively.

**Fig. S6 Actin ring formation is septin independent and SEPT7 depletion reduces efficiency of VWF string release.** HUVEC were depleted of SEPT7 using siRNA and actin ring formation assessed by immunofluorescence **(A)** siRNA transfected HUVEC were stimulated with PMA (100 ng/mL) and fixed after ten minutes. Confocal microscopy images (0.5  $\mu$ m Z stacks) were acquired using identical settings. Scale bar 10  $\mu$ m. Inset: Actin rings (magenta) could be identified in cells with minimal SEPT7 signal (green). **(B)** Western blotting detected a band at 51 kDa and demonstrated a knockdown efficiency of approx. 70% (three independent experiments). **(C)** The number of actin rings per cell was quantified. 32 images over three experiments. **(D)** Quantification of the number of VWF strings (per cell) released from HUVEC under static conditions. ns=p>0.05, \*p<0.05, \*\*p<0.01 unpaired two tailed t test. **(E)** Quantification of the length of VWF strings ( $\mu$ m). Control: 321 strings. SEPT7 KD 114 strings. **(F)** Representative images of VWF staining in LUC (left panel) and SEPT7 KD (left panel) HUVEC. Data presented as the mean from each independent experiment (n=3). Scale bar 10  $\mu$ m. **(G)** Densitometric values for confirmatory immunoblotting performed on SEPT2/7/9 depleted HUVEC.
