Screening for the primary prevention of fragility fractures among adults aged 40 years and older in primary care: systematic reviews of the effects and acceptability of screening and treatment, and the accuracy of

risk prediction tools

Additional Table 6.2. Characteristics of trials included for KQ3a on the benefits of pharmacologic treatments

Author & year; Setting Design; Funding source Length of follow-up	Population characteristics	Treatment(s) & Comparators (s) of interest Adherence	Outcomes & Ascertainment Available subgroups
As cott-Evans 2003 [1]	144 postmenopausal females (% of eligible NR) with low lumbar spine BMD	a) Oral alendronate 10 mg/day for 1 year (n = 95)	Hip fractures (not defined): self-reported as
18 centres in 9 countries (Argentina,	(T-score between -3.5 and -1.5), previously treated with hormone	b) Oral placebo for 1 year (n = 49)	AEs
Australia, Austria, Brazil, Finland, Germany,	replacement therapy and stopped within 3 months before the study; mean		Clinical fractures (not defined): self-reported
New Zealand, Spain, South Africa)	(SD) 57.3 (6.6) years old; no prior osteoporotic fractures (exclusion criteria); baseline fracture risk NR	+ calcium 500 mg/day	as AEs
2-arm RCT (parallel)		Adherence NR	Subgroups: none
	<u>Exclusion</u> : history of metabolic bone disease, os teoporotic fracture, or recent		
Industry	use of bisphosphonates and/or drugs known to affect bone metabolism		
Follow-up: 1 year			
Bell 2002[2]	65 African-American postmenopausal females (% of eligible NR) with low	a) Oral alendronate 10 mg/day for 2 years (n = 33)	Clinical fractures (not defined): self-reported
8 centres geographically distributed across	lumbarspine BMD (≤0.86 g/cm²); mean (SD) 66.2 (8.8) years old; prior	b) Oral placebo for 2 years (n = 33)	as AEs
USA	fracture NR; baseline fracture risk NR		
		+ calcium 500 mg/day, vitamin D 5001U/day	Subgroups: none
2-arm RCT (parallel)	<u>Exclusion:</u> disease or drug therapy affecting bone meta bolism; >1 lumbar		
	spine fracture; a bnormal renal function or a history of cancer or major upper	Adherence NR	
Funding NR	gastrointestinal mucosal erosive disease		
Follow-up: 2 years			
Bone 2008 [3]	332 postmenopausal ambulatory females (100% of eligible) with low lumbar	a) Subcuta neous denosumab, 60 mg every 6	Clinical fractures (new vertebral or
21 centres in the USA and Canada	spine BMD (T-scores -1.0 to -2.5); mean (SD) 59.4 (7.5) years old; no prior	months for 2 years (n = 166)	nonvertebral fractures; excluded skull, facial
	fractures (inclusion criteria); baseline fracture risk NR	b) Subcutaneous placebo for 2 years (n = 166)	bones, mandible, metacarpals, phalanges of
2-arm RCT (parallel)			the fingers/toes or if they were the result of
	Exclusion: oral bisphosphonates use for ≥ 3 years; recent treatment with anti-	+ calcium ≥1000 mg/day, vitamin D ≥400 mg/day	severe trauma): self-reported and confirmed
Industry	os teoporosis drugs; underlying condition that might result in a bnormal bone		radiographically
	metabolism	Adherence: 329 (99%) received at least one dose of	All-cause mortality: NR
Follow-up: 2 years		study medication; 86% completed treatment	
			Subgroups: none
Boonen 2012 [4]	1199 males (% of eligible NR) with low BMD (T score ≤–1.5) at the total hip or	a) Intravenous zoledronic acid 5 mg at baseline and	Hip fractures (not defined): self-reported at
Europe, South America, Africa, and	femoral neckfor those with between 1 and 3 prevalent mild/moderate	1 year (n = 588)	each visit and verified centrally by means of a
Australia	vertebral fractures or low BMD (T-score of ≤ -2.5) at the hip, femoral neck, or	b) Intravenous placebo at baseline and 1 year (n =	radiographic report or surgical notes
	lumbarspine for those without prior fractures; median (range) 66 (50-85)	611)	Clinical fractures (vertebral and
2-arm RCT (parallel)	years old; prior osteoporotic fracture NR (32% had prevalent vertebral		nonvertebral): self-reported at each visit and
	fractures); baseline fracture risk NR	+ calcium 1000 to 1500 mg/day, vitamin D 800 to	verified centrally by means of a radiographic
Industry		1200 IU/day	report or surgical notes
	<u>Exclusion:</u> ≥4 prevalent vertebral fractures; low serum 25-hydroxyvitamin D;		All-cause mortality: NR
Follow-up: 2 years	renal insufficiency; hyper/hypocalcemia; treatment with anti-osteoporosis		

Author & year; Setting Design; Funding source	Population characteristics	Treatment(s) & Comparators (s) of interest Adherence	Outcomes & Ascertainment Available subgroups
Length of follow-up			
	drugs if washout period not met; testos terone in prior year; a nabolic steroids	Adherence: 52 men who received zoledronic a cid	Subgroups: none
	or growth hormone in prior 6 months; bilateral hip replacement;	(8.8%) and 53 men who received placebo (8.7%) did	
	hyperthyroidism; primary hyperparathyroidism	not receive the second infusion	
Chesnut 1995 [5]	188 postmenopausal females (100% of eligible) with low lumber spine BMD	a) Oral alendronate groups (n = 157):	Hip fracture (not defined): self-reported as
7 centres geographically distributed a cross	(≤0.88 g/cm ²); mean (SD) 63.0 (6.3) years old; no prior spine or hip fractures	i. 5 mg/day for 2 years;	AEs and assessed by physician investigator
the US	(exclusion criteria); baseline fracture risk NR	ii. mg/day for 2 years;iii. 40 mg/day for 3 months followed by 2.5	Clinical fractures (nonvertebral fractures): ascertainment NR
6-arm RCT (parallel)	Exclusion: any disease or drug therapy potentially affecting bone metabolism;	mg/day for 21 months;	All-cause mortality (deaths during the study -
	presence of spine or hip fractures attributable to osteoporosis	iv. 20 mg/day for 1 year then placebo for 1 year;	considered an AE): as certainment NR
Industry		v. 40 mg/day for 1 year then placebo for 1 year	
		b) Oral placebo for 2 years	Subgroups: NR
Follow-up: 2 years			
		+ calcium 500 mg/day	
Cummings 1998 [6]	4432 postmenopausal females (100% of eligible) with low femoral neck BMD	a) Oral alendronate 5 mg/day for 2 years, then 10	Hip fractures (excluded pathologic fractures
11 clinical centres in the USA	(≤0.68 g/cm²); mean (SD) 67.7 (6.1) years old; 35.5% prior fracture; mean (SD)	mg/day for 2 years (n = 2214)	or fractures due to trauma): diagnosed by a
	FRAX 10-y MOF 27.0 (12.3) with BMD, 24.3 (12.2) without BMD	b) Placebo for 4 years (n = 2218)	physician and self-reported, confirmed by
2-arm RCT (parallel)			written reports of radiographs or other tests
	Exclusion: recent peptic ulcers; dyspepsia requiring daily treatment; renal or	+ 500 mg calcium, 2501U vitamin D if dietary intake	Clinical fractures (excluded pathologic
Industry	hepatic dysfunction; severe malabsorption; hypertension; myocardial	waslow	fractures or fractures due to trauma, facial
	infarction within 6 months; unstable angina; hypothyroidism or		and skull fractures): diagnosed by a physician
Follow-up: 4 years	hyperparathyroidism; estrogen or calcitonin use in prior 6 months;	Adherence: At closeout, 82.5% of surviving placebo	and confirmed by written reports of
As a sisterial schlighting the shires 2005	bisphosphonates or sodium fluoride use (>1 mg/d) at any time; vertebral	participants and 81.3% of a lendronate participants	radiographs or other tests
Associated publications: Hochberg 2005	fracture in the alendronate group	were still taking study medication	All-cause mortality: NR
[7]; Donaldson 2012 [8]			Subgroups: baseline BMD, FRAX score; age
Cummings 2009 [9]	7868 females (100% of eligible) with low BMD (T-score <2.5) at the lumbar	a) Subcuta neous denosumab 60 mg every 6 months	Hip fractures (femur neck, femur
International study centres	spine or total hip; mean (SD) 72.3 (5.2) years old; 34% had a prior	for 36 months ($n = 3922$)	intertrochanter, and femurs ubtrochanter;
	nonvertebral fracture; baseline 10 year major os teoporotic fracture risk		excluded pathologic and traumatic fractures):
2-arm RCT (parallel)	assessed with FRAX for those with BMD in the treatment group was median	b) Subcutaneous placebo every 6 months for 36	self-reported, confirmed by diagnostic
	(IQR) 15.1 (10.4-21.7) and 15.1 (10.4-21.4) in the control group. Without BMD	months (n = 3935)	imaging or a radiologist's report
Industry	was 16.9 (11.2-24.0) for the treatment group and 16.7 (11.4-24.3) for the		Clinical fractures (nonvertebral fractures
,	control group; baseline 10 year hip fracture risk assessed with FRAX for those	+ At least calcium 1000 mg/day. Those with a	excluding the skull, face, mandible,
Follow-up: 3 years	with BMD was 4.8 (2.5-8.7) in the treatment group and 4.8 (2.5-8.7) in the	baseline 25-hydroxyvitamin D level of 12-20 ng/ml	meta carpals, fingers, toes, pathologic and
	control group. Without BMD was 6.2 (3.5-10.6) in the treatment group and	were given at least vitamin D 8001U/day, and those	traumatic fractures): self-reported, confirmed
Associated publications: Boonen 2011 [10];	6.1 (3.5-10.7) in the control group	with a baseline level above 20 ng/ml were given at	by diagnostic imaging or a radiologist's report

--

Author & year	Date of search	Study eligibility	Risk of bias appraisal	Outcomes & Ascertainment
Funding source			Certainty appraisal	
Chen 2015 [1]	Inception to June 2014	Design: cohorts Population: females and males with osteoporosis	Newcastle-Ottawa Scale	GI cancer: separate a nalyses for each of colorectal, gastric, es ophageal, liver, pancreatic, oral, bile duct, small intestinal
No external funding		Interventions: a lendronate or bisphosphonate (any dose) vs. controls (not specified)	Certainty not assessed	
Crandall 2014 (AHRQ) [2,3]	March 2014 (updating	Design: RCTs, large (n>1,000) observational studies and case reports for rare events	ROB not assessed for harm outcomes	Non-serious GIAE: conditions such as a cid reflux, es ophageal irritation, na usea, vomiting, and heartburn
Courses	an earlier report);	Population: adults with or without low bone		Influenza-like symptoms: separate analyses for 'influenza-like symptoms', and
Government	later updated to July 2016 for	density/osteoporosis (could be due to chronic use of glucocorticoids, but not other diseases of bone metabolism)	Strength of evidence using	composite of arthralgia, myalgia, pyrexia, chills, and influenza-like symptoms
	bisphosphonates [4]	Interventions: a lendronate, risedronate, zoledronic a cid,	AHRQ methods (similar to GRADE) for selected	Musculoske let al pain: separate a nalyses for arthritis, arthralgia; myalgia, cramps, limb pain
		denos umab (any FDA-approved dose) vs. placebo	outcomes	Serious cardiovascular AE: separate a nalyses for acute coronary syndrome, cerebrovascular death, serious cerebrovascular accidents, pulmonary embolism,
				thromboembolic events, serious cardiac events
				Serious cardiac rhythm disturbances: a trial fibrillation
				Serious GIAE (excluding cancer): separate a nalyses for all serious GIAE; GI perforations, ulcers, bleeds; serious esophageal AE; serious hepatobiliary AE
				Gi cancer: separate a nalyses for es ophageal cancer, Gi cancer, colon cancer
				Dermatologic AE: separate a nalyses for injection site reactions; rash/eczema
				Infections: NR; used a previously published pooled analysis
				Atypical femoral fractures: atypical (low-stress) subtrochanteric or femoral
				fractures
				Osteonecrosis of the jaw: NR
Davis 2016 (NIHR) [5]	2008 to September	Design: RCTs; non-randomized studies if needed	ROB not assessed for harm	Any non-serious AE: any adverse event
	2014	Population: females \geq 65 and males \geq 75 years, or younger	outcomes	Influenza-like symptoms: variable - upper respiratory infections, influenza,
Government		with low BMD (T-score ≤-1) or risk factors. Interventions: alendronate (10mg/day or 70 mg/week),	Certainty not assessed	pyrexia, headache, chills, nasopharyngitis, bronchitis, pneumonia, cough, fatigue
		risedronate (5 mg/day or 35 mg/week), zoledronic acid (5	Certainty not assessed	The symptoms analyzed varied across drugs based on trial reporting
		mg/year) vs. placeboor non-active treatments		The symptoms analyzed varied across drugs based on than eporting
Davis 2020 (NIHR) [6]	Inception to July 2018	Design: RCTs	ROB not assessed for harm	Any non-serious AE: any adverse event
		Population: females ≥65 and males ≥75 years, or younger	outcomes	Any serious AE: number of patients experiencing any serious AE
Government		with presence of risk factors.		Serious cardiovascular AE: separate analyses for stroke, venous
		Interventions: denosumab (60 mg/6 months) vs. placebo or	Certainty not assessed	thromboembolism
		non-active treatments		Venous thromboembolism: NR
				Atypical femoral fractures: NR, as described in the included studies
Dia dh an 2015 [7]		Desire DCTs anomative schools	DOD not a constant	Osteonecrosis of the jaw: NR, as described in the included studies
Diedhou 2015 [7]	Date of search NR	Design: RCTs, prospective cohorts Population: females and males treated to prevent or reduce	ROB not as sessed	Musculoskeletal pain: arthralgia
Funding NR		fractures	Certainty not assessed	

Author & year Funding source	Date of search	Study eligibility	Risk of bias appraisal Certainty appraisal	Outcomes & Ascertainment
		Interventions: denosumab (60 mg/6 months) vs. placebo		
Fink 2019 (AHRQ) [8]	January 1995 to October 2018	Design: RCTs, observational studies Population: females and males ≥50 years on osteoporosis	ROB not assessed for harm outcomes	Atypical femoral fracture: subtrochanteric or femoral fractures with a typical features (with or without radiologic confirmation). Excluded pathologic,
Government		treatment for >3 years (rare harms); Interventions: a lendronate, zoledronic acid, denosumab (any dose) vs. placebo	GRADE	periprosthetic, traumatic fractures. Osteonecrosis of the jaw: defined by diagnostic codes ± clinical confirmation
Kranenburg 2016 [9]	Inception to January 2016	Design: RCTs Population: any patients treated for ≥1 year	Cochrane ROB tool	Serious cardiovascular AE: separate a nalyses for cardiovascular mortality, stroke, myocardial infarction, and composite or nonfatal stroke, nonfatal
Funding NR		Interventions: a lendronate, risedronate, zoledronic a cid (any dose) vs. placebo or no treatment	Certainty not assessed	myocardial infarction, death due to vascular cause.
Lv 2020 [10]	Inception to June 2019	Design: RCTs Population: participants with primary osteoporosis or	Cochrane ROB tool	Serious cardiovascular AE: separate a nalyses for three composite cardiovascular endpoints: 1) cardiovascular death or death, myocardial
Government		osteopenia and without disorders likely to affect bone metabolism, with follow-up of ≥6 months Interventions: denosumab (any market-approved dose) vs. placebo	Certainty not assessed	infarction, stroke; 2) [1] and heart failure, 3) stroke, atrial fibrillation, heart failure, coronary heart disease
Tsourdi 2020 [11]	Inception to August 2020	Design: RCTs, observational studies including case series Population: studies where patients discontinued denosumab	ROB not as sessed	Rebound fractures (hip, clinical, clinical vertebral, multiple clinical vertebral): fractures that occurred after stopping treatment.
No external funding		(includes cancer patients and those receiving glucocorticoid treatment). Excluded those with metastatic disease, metabolic bone disease. Interventions: denosumab and its discontinuation vs.	Certainty not assessed	
Viswanathan 2018 (USPSTF) [12, 13]	November 2009 to October 2016; active	discontinuation of placebo Design: RCTs, observational studies published since any recent systematic review	ROB not assessed for harm outcomes	Discontinuations due to AE: discontinuation attributed to AEs, including any of: cardiovascular events, hot flashes, es ophageal cancer, gastrointestinal events,
Government	surveillance through March 2018	Population: studies where the majority of a dults with increased risk of fracture Interventions: a lendronate, risedronate, zoledronic a cid, denos umab (FDA-approved doses) vs. placebo or no treatment	Strength of evidence using USPSTF methods	os teonecrosis of the jaw, atypical fractures of the femur, and rashes. Serious AE: NR, appears to include any serious AE Serious cardiac rhythm disturbances: a trial fibrillation

Study description		Information provided on benefits and harms	
Participants were presented with information on benefits and harms of screening (and associated treatment) in one of four formats: words, numbers, numbers + narrative, numbers + framed presentation	consecutive days), <3 drinks per day, nonsmokers. Women were eligible if they had an upcoming visit, and were eligible to receive information on osteoporosis screening at one of four community-based practices affiliated with the Duke Primary Care Research Consortium. Age, mean: 57 y Menopausal status: NR BMD: NR Prior fracture: none (exclusion criteria) Osteoporosis dx: NR Medication use: NR Concern about fractures: NR Perceived severity of fractures: NR Absolute fracture risk: After screening, mean (SD) risk (range 1-4 where higher scores indicate higher risk) ranged from 1.76 (0.82) to 2.27 (1.00) across groups. Previous screening: 146 (57%)	 Knowledge of risk: Knowledge of risk not applicable, because patients have not been screened. After reading the information, mean (SD) disease specific knowledge (range 0-2, where higher scores indicate greater knowledge) ranged from 1.13 (0.72) to 1.20 (0.59) across groups. Mean (SD) general screening knowledge (range 0-8, where higher scores indicate greater knowledge) ranged from 5.33 (1.93) to 5.74 (1.76) across groups. Benefits of screening and treatment: (1) Words: finding and treating osteoporosis early reduces broken hip bones in very few of the women who are screened and treated and reduces the chances of other broken bones in a few. (2) Numbers: finding and treating osteoporosis early reduces broken hip bones in 2 per 1000 screened and treated over 10 years (7 per 1000 to 5 per 1000) and reduces the chances of other broken bones. (3) Numbers + narrative: same as presentation of numbers, but with added narrative from women and photographs. (4) Numbers + framed: same as presentation of numbers for benefits Harms of screening and treatment: Finding out about osteoporosis might lead some women to worry about a broken bone. Experts are unsure how many women worry. Bisphosphonates may cause minor stoma chupset in not taken according to instructions. They may also cause muscle and joint pains in some people. Most serious symptoms are rare. Overdiagnosis presented by showing that incident disease rates exceed important outcomes: "It affects 45 of every 1000 women you age. It increases the changes of broken bone. (2) Numbers: Of every 1000 women treated over 10 years 1 to 10 will have damage to the jaw (osteonecrosis) or atypical breaks of the bone. (3) Numbers + narrative: same as presentation of numbers, but with added narrative from women and photographs. 	Words: 3.64 (1.08) vs. 3.38 (1.16); MD -0.23 (-0.40, -0.06), p < 0.001 Numbers: 3.73 (1.08) vs. 3.73 (1.10); MD 0.02 (-0.15, 0.19), ns Narrative: 3.88 (0.69) vs. 3.82 (0.85); MD -0.06 (-0.23, 0.11), ns Framed: 3.69 (0.92) vs. 3.67 (1.18); MD -0.05 (-0.21, 0.12), ns Subgroups: - There was no difference in the change in intention to accept screening between groups (p = 0.19) - Change in intention to accept screening did not differ by subgroups of patients defined by previous screening or worry about health
