

Online Supplementary Figure S2. Pulmonary Function tests. Longitudinal changes in pulmonary function indices are expressed as relative (%) change from the baseline (screening visit). Shown are the interquartile range with median (box and horizontal line), minimum and maximum value (whiskers) and inner individual values (circles). N=9 for month 6 (M6) and N=8 for month 12 (M12). FEV1, forced expiratory volume at 1 second; FVC, forced vital capacity; TLC, total lung capacity; FRC, function residual capacity; SpO2, peripheral capillary oxygen saturation; DLCO, diffusion capacity of the lungs for carbon monoxide; pred, predicted.
