

SUPPLEMENTARY MATERIAL

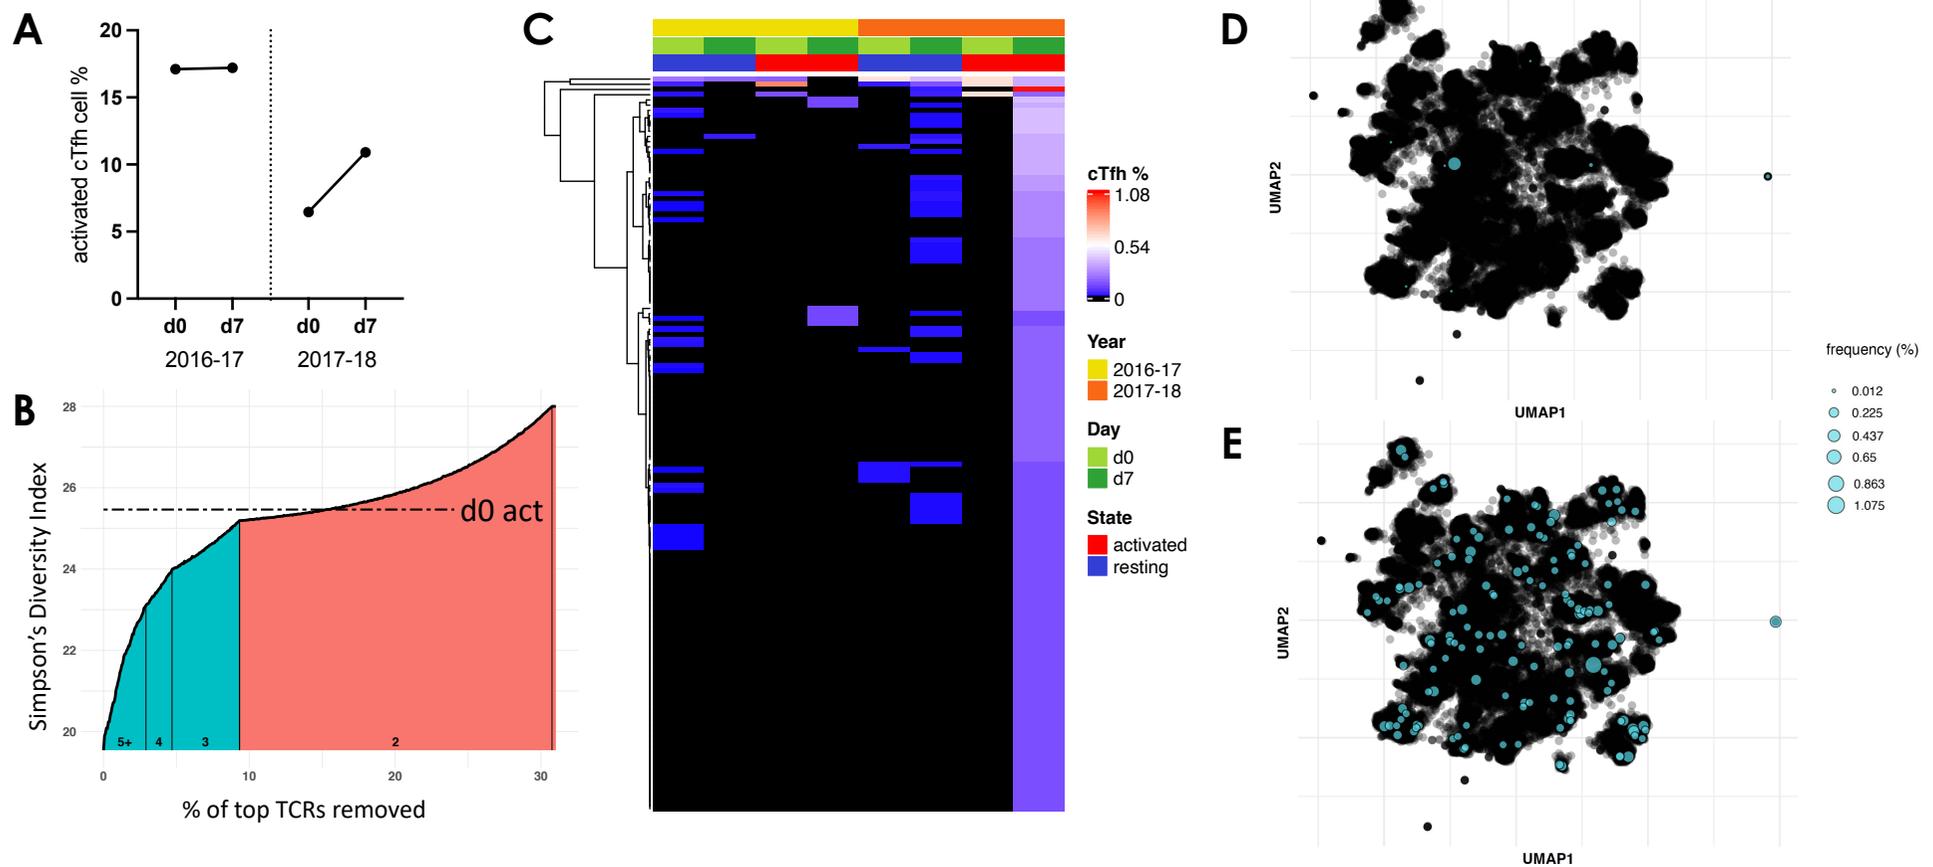

Supplementary Fig 1. The magnitude of (A) cTfh and (B) plasmablast activation did not correlate between vaccination years.

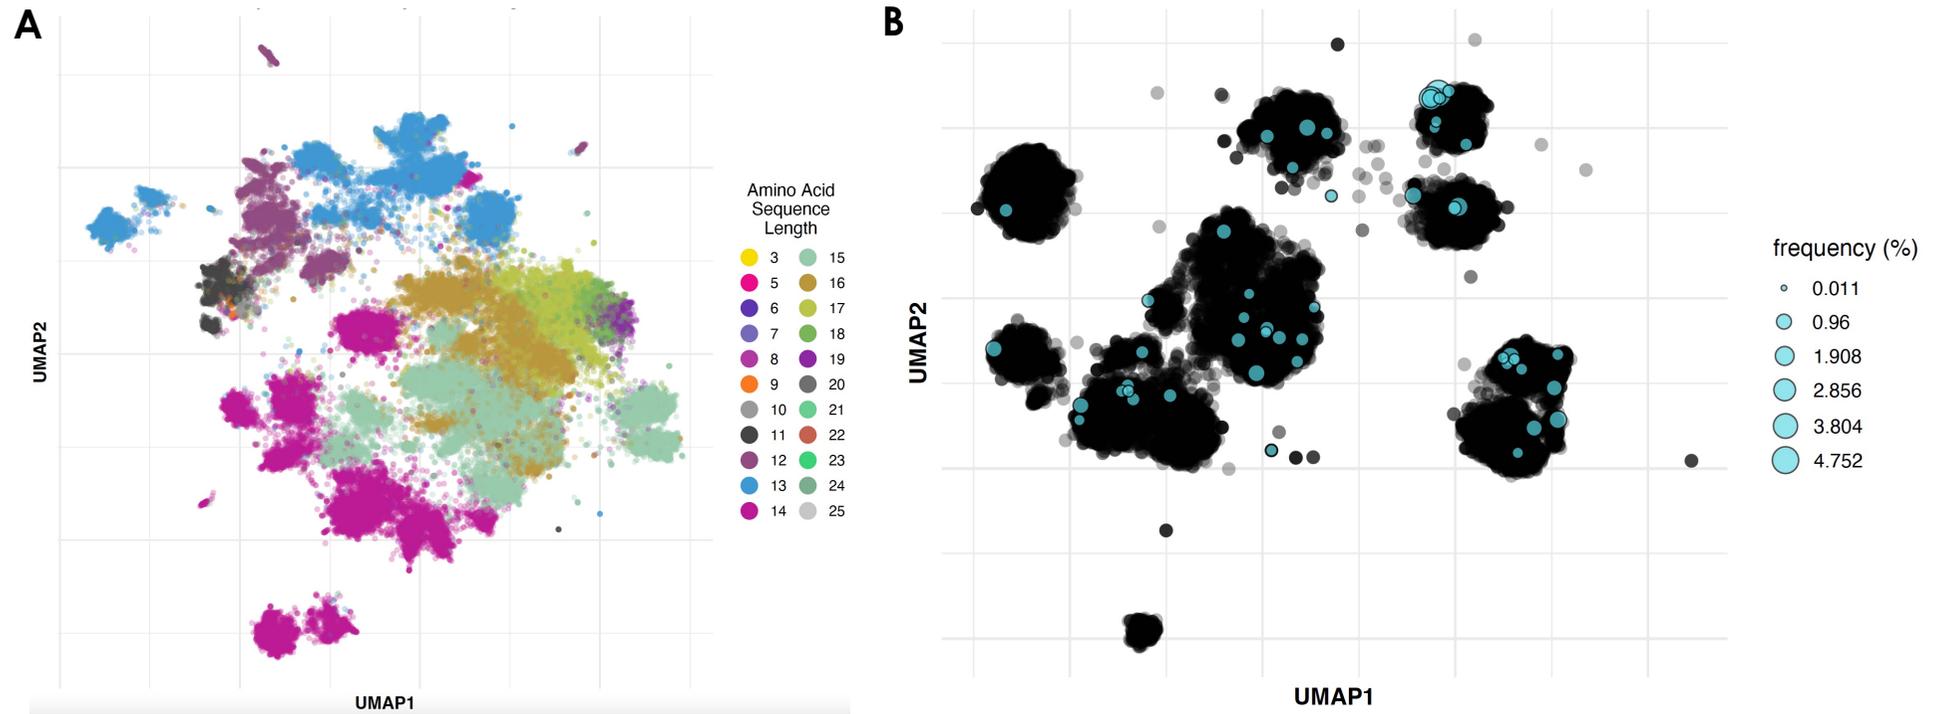

Supplementary Fig 2. Genetic variation in H1N1 strains results in differing numbers of predicted peptides with binding affinities. Peptides with predicted capacity to bind to all HLA-DR alleles (A) and -DQ allele combinations (B) within the cohort were identified. Using the 2016-17 vaccine season as a baseline, a change in the number of peptides with predicted binding capacity was identified with overlap indicated centrally in red.

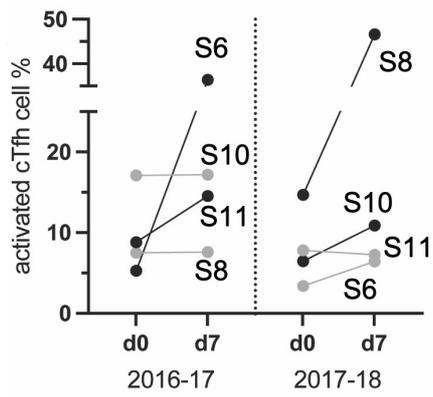

Supplementary Fig 3. Genetic variation between influenza A H1N1 A/California/7/2009 and A/Michigan/45/2015 strains results in differences in predicted peptide binding affinities, potentially impacting subject-specific epitope repertoire. Peptides with predicted capacity to bind to all HLA-DR alleles and allele combinations for each subject were identified. (A) Combined counts of predicted HLA-DR/DQ binding peptides shows a small, yet significant, reduction in the 2017-18 season, compared to 2016-17 in this cohort ($p = 0.002$; Wilcoxon signed rank test). Moreover, this appears to be primarily driven by peptides associated with HLA-DR (B; $p=0.002$; Wilcoxon signed rank test), rather than with HLA-DQ (C; $p = 0.15$; Wilcoxon signed rank test).

Supplementary Fig 4. A sub-population of cTfh cells is expanded following influenza vaccination in 2017-18. (A) Subject 10 showed an increase in cTfh cell response after the 2017-18 vaccine, with a minimal response the previous season. (B) Approximately 10% of activated cTfh cells at d7 expanded based on their TCR repertoire from d0 to d7 following the 2017-18 vaccine (shaded teal). As the intersection with d0 activated cTfh cell diversity fell within a count bracket, TCRs observed at this count (of 2) were not included in those deemed to be expanded. (C) The frequencies of cTfh cells with a TCR designated to be expanded from (B) are depicted for all conditions as a heatmap (hierarchical clustering). Of the cells expanded at d7 following the 2017-18 vaccination, very few TCRs were observed following the 2016-17 vaccine, nor in the d0 active populations. The TCR repertoire was clustered and expanded clonotypes post-vaccination in 2017-18 were highlighted for (D) d0 resting and (E) d7 active conditions.

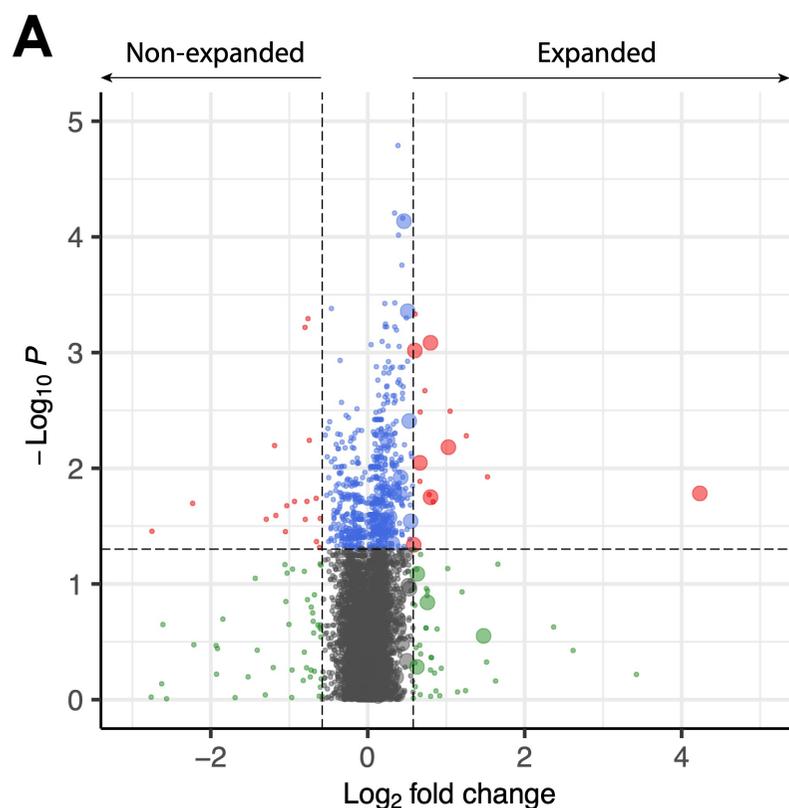

Supplementary Fig 5. TCRs of the same length largely cluster together and expanded clonotypes likely identify different antigens. (A) Clustering of all subject 6 TCRs is largely driven by CDR3 length. **(B)** Using only the dominant CDR3 length of 15, a further sub-clustering was identified. Highlighting those TCRs expanded in the d7 active population in 2016-17 identifies their presence in nearly all clusters.

Supplementary Fig 6. Expanded activated cTfh cells sorted for TCR β sequencing and transcriptomic analysis.

Percentage of cTfh cells activated at d0 and d7 for the four subjects selected for single cell sorting. The sorted samples from a season for each subject is in black, with the non-sorted samples from the alternate season in grey.

Supplementary Fig 7. Different transcriptional profile between non-expanded and expanded activated cTfh cells at d7. (A) Volcano plot comparing non-expanded and expanded activated cTfh cells for all four subjects at d7. Significant DEGs by both p value and fold change are depicted in red. Horizontal and vertical dotted lines represent a significance threshold of $p < 0.05$ and a fold change of $|1.5|$, respectively. Significant DEGs identified to be upregulated in expanded cTfh cells compared to resting (Fig 6A) are depicted by an increased point size. Such genes that remained significant by either p value and fold change or by one alone are listed in (B), with those not significant listed in (C).

Supplementary Fig 8. Example representation of flow gating for sorting resting and activated cTfh cells. Gating strategy for quantifying and sorting activated and resting cTfh cell populations. The gating strategy was the same for all subjects.

Supplementary Fig 9. Representative plots showing the convergence of the Inverse Simpson's Index after 5000 re-samplings. (A) The Inverse Simpson's Index scores for subject 9 for the 2017-18 season d0 resting cTfh population plotted after each resampling. (B) The final 100 re-samplings to show the convergence of scores after 5000 re-samplings.

Supplementary Table 1. Significant DEGs for resting (pct.2) versus expanded (pct.1) cTfh cells.

immune response-regulating signaling pathway	6.0E-07	5.2E-05	IGLC2/IGLV2-8/IGHG3/ELMO2/IGLV2-14/IGLC3/PSMD13/PTPRC/GRAP2/PSMA4/ACTG1	11
humoral immune response	6.3E-07	5.2E-05	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3/GPI/PTPRC/CFD	8
Fc-epsilon receptor signaling pathway	7.4E-07	5.8E-05	IGLC2/IGLV2-8/IGLV2-14/IGLC3/PSMD13/GRAP2/PSMA4	7
complement activation, classical pathway	2.4E-06	1.7E-04	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3	5
regulation of complement activation	2.4E-06	1.7E-04	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3	5
phagocytosis, engulfment	1.0E-05	6.9E-04	IGLC2/IGHG3/IGLC3/RAC2/RHOG	5
regulation of immune effector process	1.5E-05	9.2E-04	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3/GPI/RAC2/PTPRC/AP1G1	9
immunoglobulin mediated immune response	1.6E-05	9.3E-04	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3/PTPRC	6
B cell mediated immunity	1.7E-05	9.7E-04	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3/PTPRC	6
plasma membrane invagination	1.9E-05	1.0E-03	IGLC2/IGHG3/IGLC3/RAC2/RHOG	5
membrane invagination	3.0E-05	1.6E-03	IGLC2/IGHG3/IGLC3/RAC2/RHOG	5
lymphocyte mediated immunity	7.5E-05	3.7E-03	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3/PTPRC/AP1G1	7
antigen receptor-mediated signaling pathway	7.7E-05	3.7E-03	IGLC2/IGHG3/IGLC3/PSMD13/PTPRC/GRAP2/PSMA4	7
leukocyte migration	1.4E-04	6.4E-03	IGLC2/IGLV2-8/IGLV2-14/IGLC3/RAC2/SLC7A6/ITGAL/RHOG	8
regulation of B cell activation	1.8E-04	7.9E-03	IGLC2/IGHG3/IGLC3/HMGB3/PTPRC	5
B cell receptor signaling pathway	2.4E-04	1.0E-02	IGLC2/IGHG3/IGLC3/PTPRC	4
regulation of lymphocyte activation	2.5E-04	1.0E-02	IGLC2/IGHG3/IGLC3/HMGB3/RAC2/PTPRC/GRAP2/AP1G1	8
phagocytosis, recognition	2.9E-04	1.2E-02	IGLC2/IGHG3/IGLC3	3
positive regulation of B cell activation	4.5E-04	1.8E-02	IGLC2/IGHG3/IGLC3/PTPRC	4
adaptive immune response based on somatic recombination of immune receptors built from immunoglobulin superfamily domains	6.7E-04	2.5E-02	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3/PTPRC	6
regulation of leukocyte activation	7.2E-04	2.6E-02	IGLC2/IGHG3/IGLC3/HMGB3/RAC2/PTPRC/GRAP2/AP1G1	8
leukocyte degranulation	7.6E-04	2.7E-02	GPI/RAC2/PSMD13/PTPRC/AP1G1/CFD/ITGAL/RHOG	8
antigen processing and presentation of peptide antigen	8.6E-04	3.0E-02	ERAP2/PSMD13/PSMA4/DCTN5/AP1G1	5
positive regulation of lymphocyte activation	9.0E-04	3.1E-02	IGLC2/IGHG3/IGLC3/PTPRC/GRAP2/AP1G1	6
negative regulation of peptidyl-tyrosine phosphorylation	9.2E-04	3.1E-02	SOCS4/PTPRC/PARP14	3
immunoglobulin production	1.3E-03	4.3E-02	IGLV2-8/IGLV2-14/GPI/PTPRC	4
immunoglobulin complex	1.9E-07	3.7E-05	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3	5
immunoglobulin complex, circulating	8.6E-05	8.2E-03	IGLC2/IGHG3/IGLC3	3
blood microparticle	4.9E-04	3.1E-02	IGLC2/IGHG3/IGLC3/ACTG1	4
antigen binding	1.9E-05	3.6E-03	IGLC2/IGLV2-8/IGHG3/IGLV2-14/IGLC3	5
immunoglobulin receptor binding	1.3E-04	1.2E-02	IGLC2/IGHG3/IGLC3	3

Supplementary Table 5. The number of unique and total CDR3s identified for each subject by condition.

Subject	Year	Day	State	No. unique CDR3s	Total CDR3s
2	2016-17	d0	activated	360	481
			resting	6016	8186
		d7	activated	40	50
