

## Astrocytic markers

## Neuronal markers

## Stem cell markers

## Immature neurons

## Supplementary Figure 1. Characterization of hCO during differentiation

Relative gene expression analysis for astrocytic markers (*GFAP*, *S100b*, *GLAST*, *GLT1*), markers of differentiated neurons (*MAP-2*, *SYP*, *NeuN*, *GRIN1*, *GAD1*), stem cell markers (*SOX1*, *SOX2*, *NESTIN*) and markers associated with immature neurons (*DCX*, *Tuj1*). Data are shown as floating min-to-max bars with line at mean. Symbols indicate individual hCO (n= 3-4). One-way ANOVA followed by Tukey's multiple comparisons. \*p< 0.05, \*\*p< 0.01, \*\*\*p< 0.001 vs NPC, °p< 0.05, °°p<0.01; °°° p<0.001 vs hCO 14DIV.

**Supplementary Figure 2. Electrophysiological properties of hCO neurons (DIV 60)**

A) Representative voltage trace of current clamp recordings in response to depolarising current step. B) Incidence of neurons firing action potentials (AP) in response to depolarising current steps (8/11). C) Representative traces of voltage clamp recordings showing fast inward currents followed by long-lasting outward currents in response to voltage steps in 10 mV increments.
