1 **eAppendix 1.** Postdefinitive Treatment Group Analysis

2 The post-definitive treatment time point was defined as the first time point after
3 completion of definitive therapy. For patients who underwent surgery alone, the time
4 point was approximately 30 days after the surgery. For adjuvant chemotherapy (ACT)
5 patients, the timepoint range of 0-5.4 months after ACT.

6

7 **eAppendix 2.** Surveillance Analysis

8 Patients enrolled in the surveillance analysis consisted of all patients who removed
9 time points immediately after treatment (surgery and adjuvant chemotherapy [ACT])
10 except no-ACT-treated cases with only postoperative month 1 plasma available; also
11 removing samples less than 6m follow-up time after the first positive timepoint after
12 treatment.

13

14 **eAppendix 3.** Circulating Tumor DNA Maintenance Analysis

15 Patients with at least two blood samples drawn postoperatively and consistent
16 ColonAiQ results were enrolled in this analysis. Patients were defined as positive if
17 the ColonAiQ tests remained unchanged and positive for all time points or as negative
18 if the ColonAiQ tests were negative for all time points.

19

20 **eAppendix 4.** ColonAiQ Assay

21 One tube of 8-10 mL of whole blood was collected from each patient and roughly 3-4
22 mL of plasma was separated by a double-spin procedure. Plasma DNA extraction was
23 performed using the QIAamp Circulating Nucleic Acid Kit (Qiagen, Hilden,
24 Germany). DNA concentration was measured using a Qubit 3.0 fluorometer (Thermo
25 Fisher Scientific). For bisulfite conversion, 10-20 ng of extracted DNA was converted
26 using the EZ DNA Methylation-Lightning Kit (ZYMO RESEARCH) according to the
27 manufacturer's instructions. The converted DNA was processed using the ColonAiQ
28 kit (Cat. # QP010048R, Singlera Genomics (Shanghai) Ltd., Shanghai, China)

29 according to the manufacturer's protocol. Specifically, DNA was amplified with a pre-
30 amplification primer pool, followed by quantitative PCR using the standard procedure
31 in an ABI 7500 Real-Time PCR thermal cycler. The reference gene ACTB was used
32 as an experimental quality control. The cut-off Ct for Septin9 locus 1, BCAT1,
33 IKZF1, Septin9 locus 2, VAV3, and BCAN were 31.5, 35, 35, 35, 35, and 30,
34 respectively. A marker was considered positive if its Ct in the test was lower than its
35 cut-off Ct ($Ct_{test} < Ct_{cutoff}$). A sample was considered positive if any of the six markers
36 were positive.

37

38 **eAppendix 5. Statistical Analysis**

39 Sensitivity was defined as the number of patients with positive test results divided by
40 the total number of patients with clinical relapse. Specificity was defined as the
41 number of patients with negative test results divided by the total number of relapse-
42 free patients. Statistical analyses were performed using R software v4.1.3. P values
43 were based on 2-sided testing, and differences were considered significant at $P < 0.05$.

44

45 **eAppendix 6. Carcinoembryonic Antigen (CEA) Test and Integration of CEA With**
46 **Circulating Tumor DNA**

47 The concentration of CEA was determined by an electrochemiluminescence
48 immunoassay using a Roche Cobas 8000 immunoassay analyzer (Roche Diagnostics,
49 Mannheim, Germany). A sample with CEA levels of 5.2 ng/mL or above was
50 considered positive. The integration of CEA and ctDNA was considered to be positive
51 if a patient with a positive result in any of the two tests.
