

Fig. S1: IRE1 α deficiency in rod photoreceptors induces age-related retinal degeneration. (A-D) OCT measurements showing retinal and ONL thickness of IRE1 α deficient retinas at 1, 3, 6 and 9 months old, respectively showing no sex influence at any analyzed time point. Data are presented as mean \pm SEM. *** $p < 0.001$, **** $p < 0.0001$; two-tailed Student's t-test.

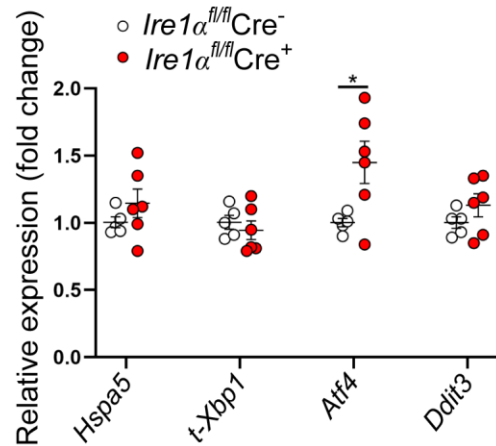

Fig. S2: PERK pathway is increased in IRE1 α deficient retinas. qPCR data from 1 month old IRE1 α deficient retinas showing an increase in the expression of *Atf4* that is downstream of PERK while *Ddit3*, *Hspa5* and *Xbp1* remain unchanged (n=5-6). Data are presented as mean \pm SEM. * $p < 0.05$; two-tailed Student's t-test.

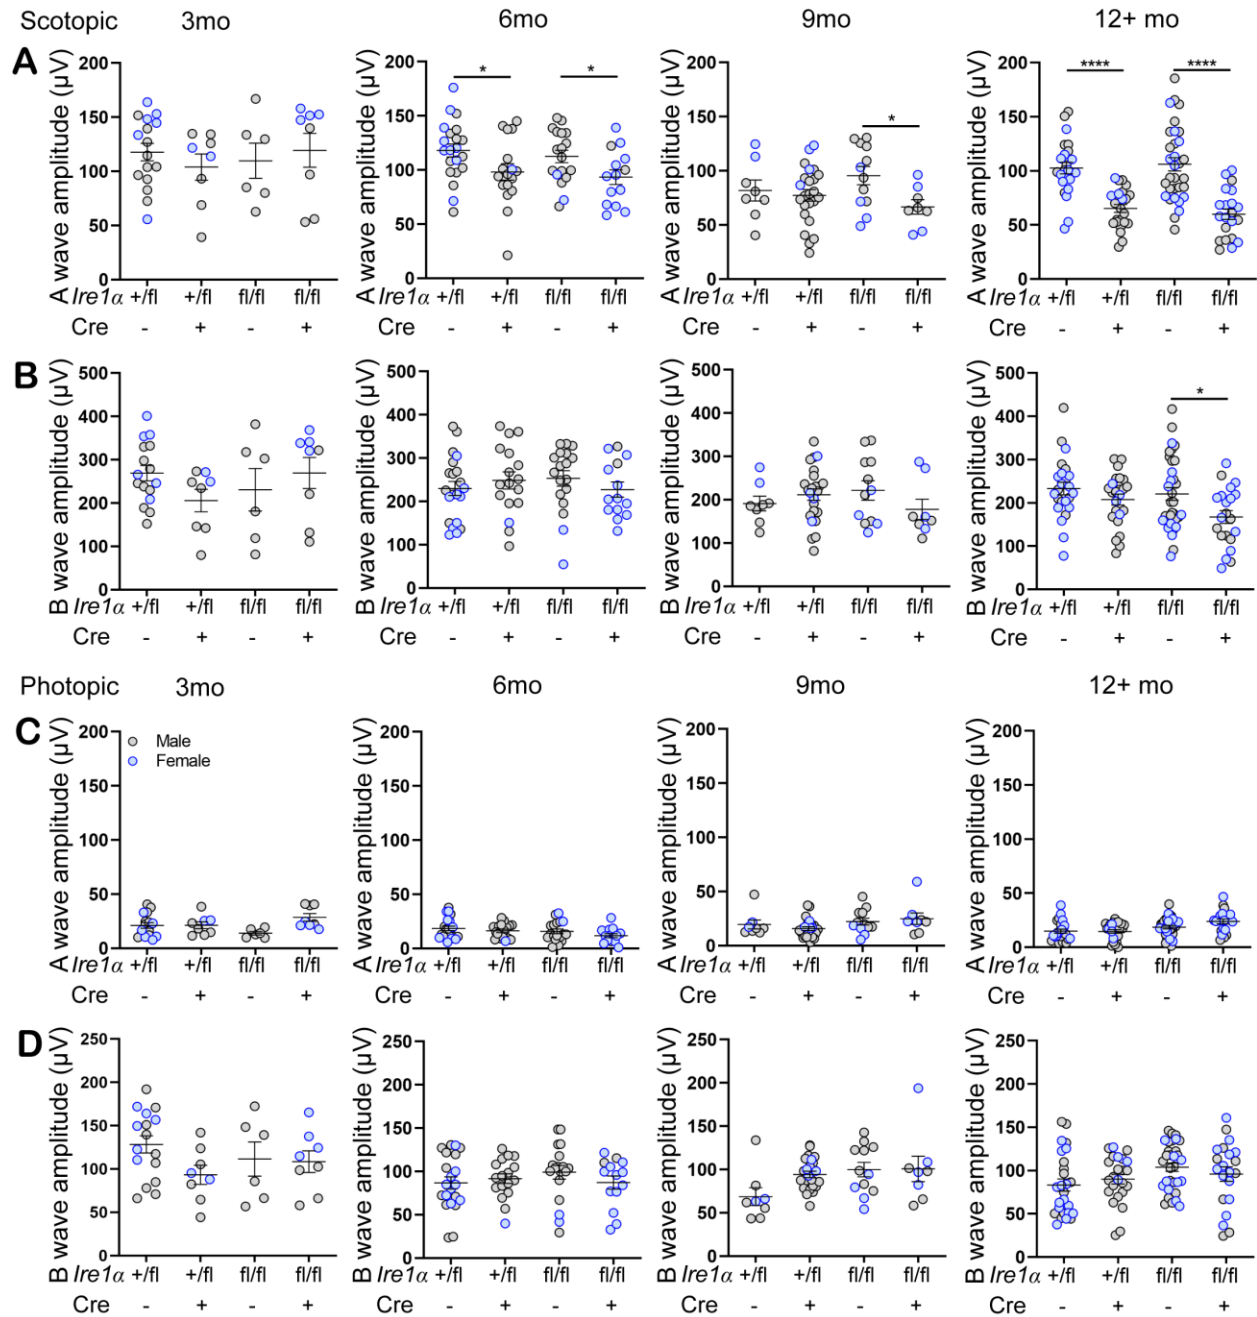

Fig. S3: IRE1 α deficiency in rod photoreceptors causes retinal functional deficits. (A and B) are scotopic and (C and D) are photopic ERGs recordings at 3, 6 and 9 months old represented by sex and showing a similar distribution between males and females at every recorded time point. Data are presented as mean \pm SEM. * $p < 0.05$, **** $p < 0.0001$; two-tailed Student's t-test.

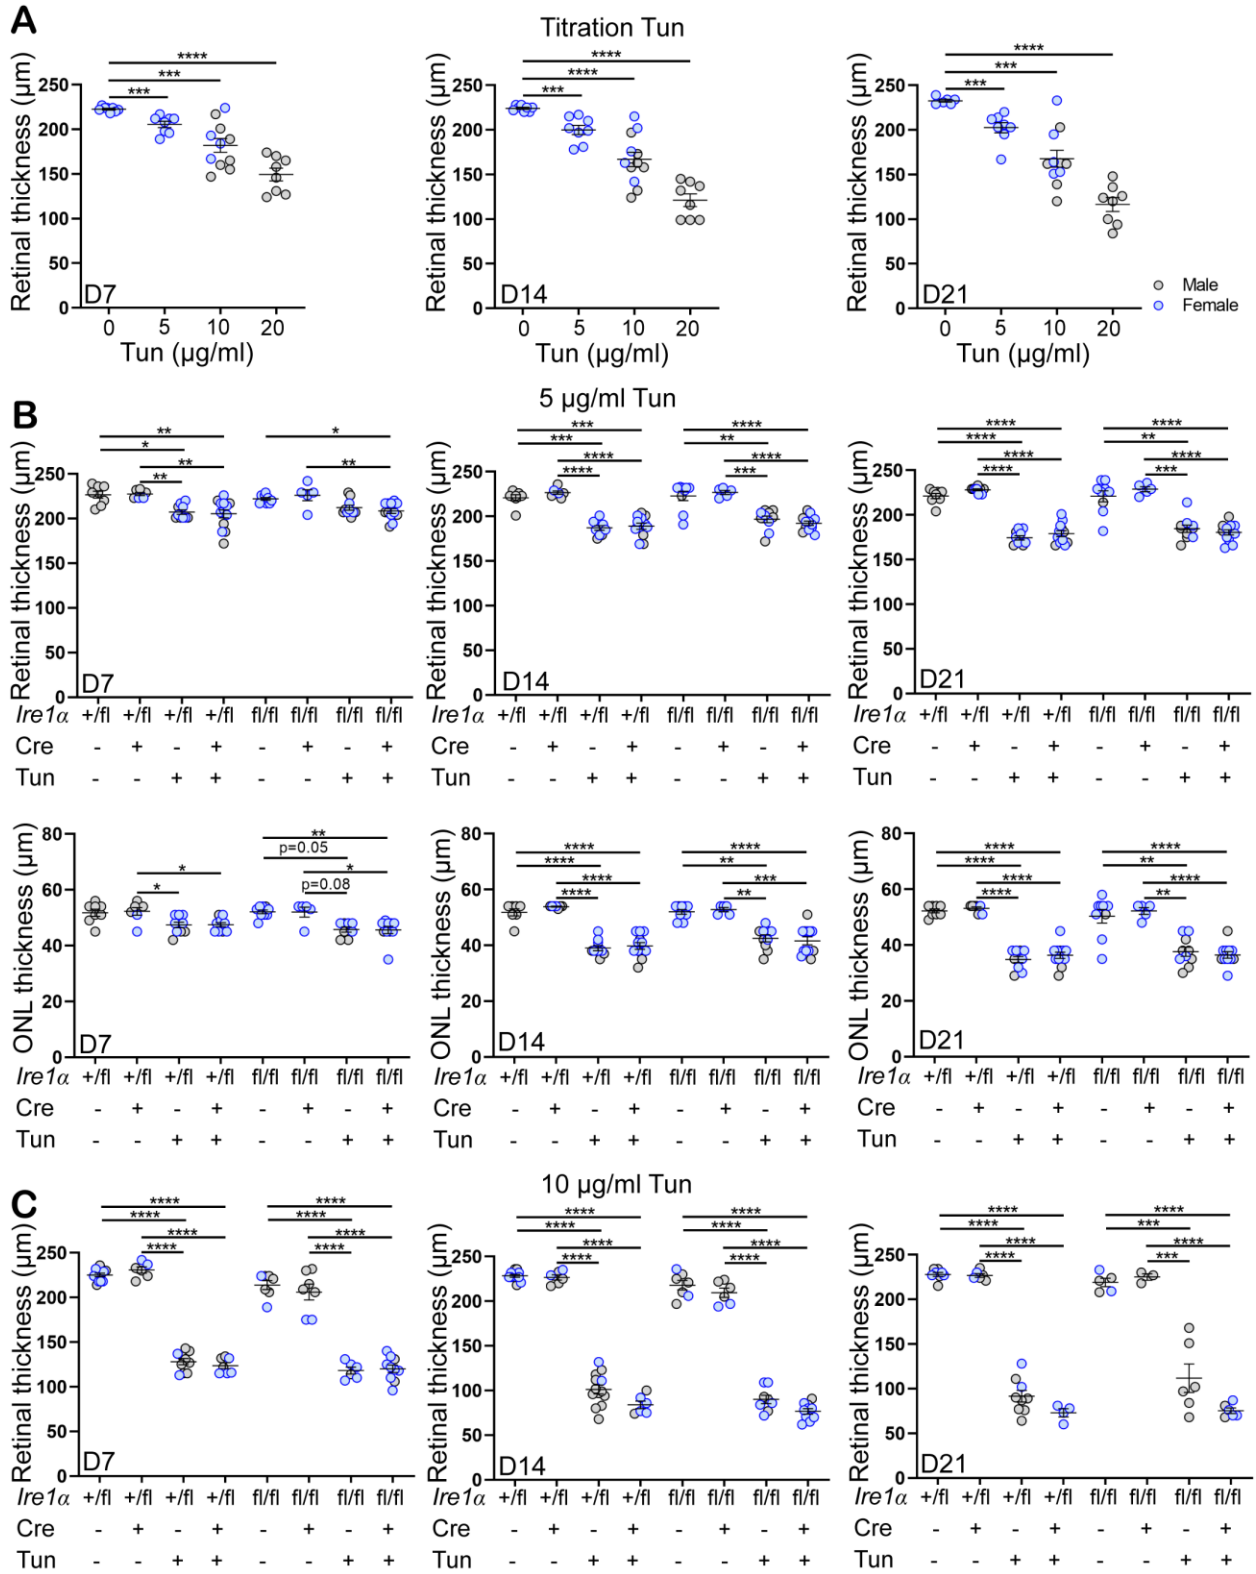

Fig. S4: Sex does not influence retinal thickness in response to chemically induced ER stress. OCT measurements of retinal and ONL thickness following intravitreal injection of tunicamycin. The data indicate that tunicamycin-induced retinal degeneration affects males and

females similarly for both the wild type (**A**) and IRE1 α deficient retinas (**B** and **C**). Data are presented as mean \pm SEM. *p < 0.05, **p < 0.01, ***p < 0.001, ****p < 0.0001; two-tailed Student's t-test for wild type mice and two-way ANOVA for IRE1 α deficient retinas. Tun, tunicamycin.

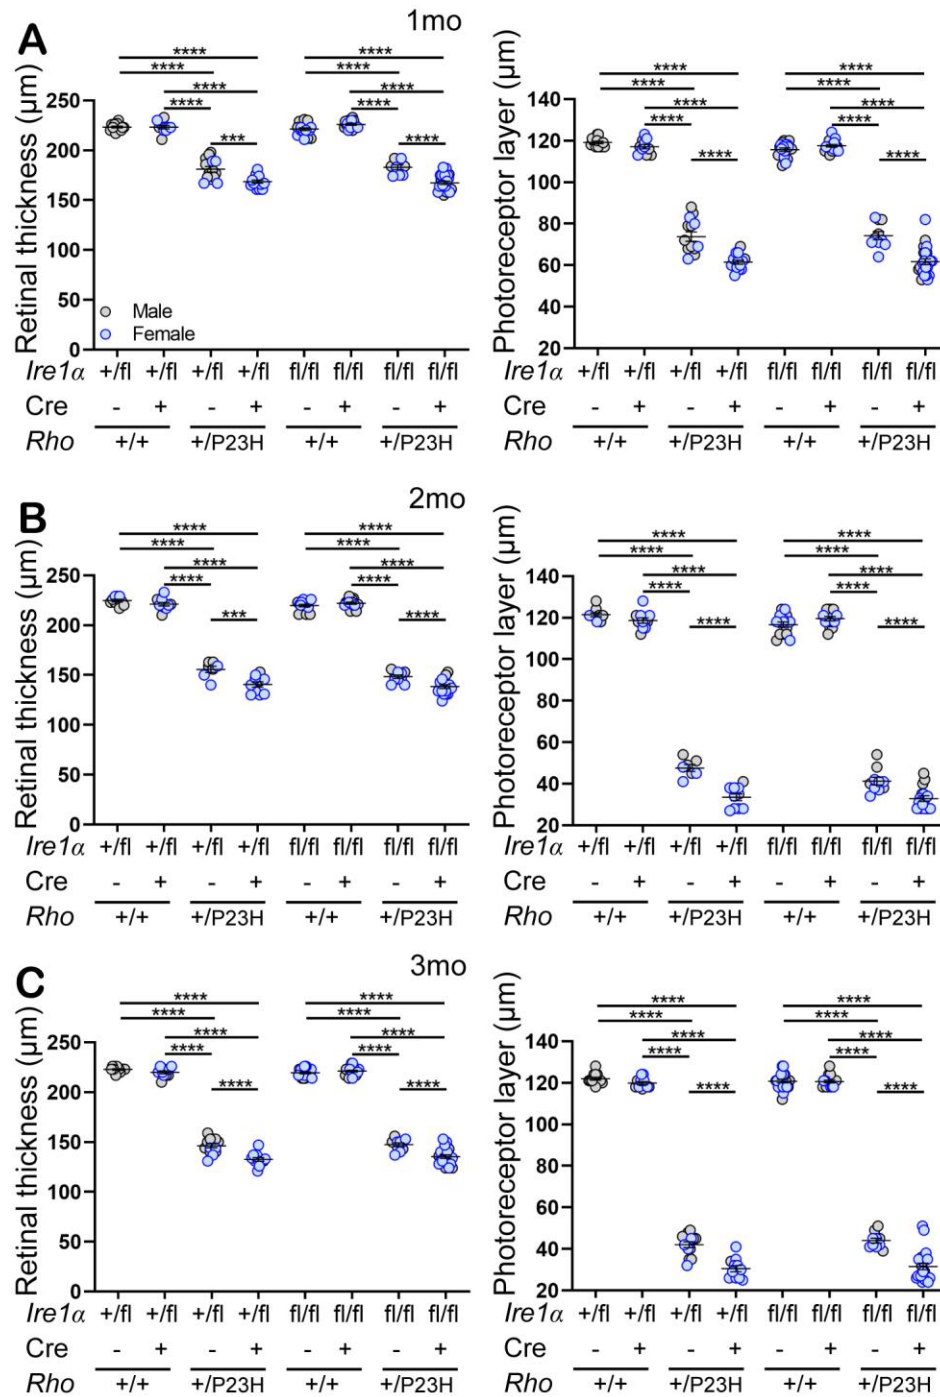

Fig. S5: Inactivation of *Ire1 α* in rod photoreceptors affects similarly the males and females in retinal degeneration caused by *Rho*^{P23H} mutation. (A-C) OCT data of IRE1 α deficient mice in *Rho*^{+P23H} or *Rho*^{+/+} background at 1, 2, and 3 months old respectively, showing a similar variation of retinal and photoreceptor layer thickness between males and females. Data are presented as mean \pm SEM. *p < 0.001, ****p < 0.0001; two-way ANOVA.**

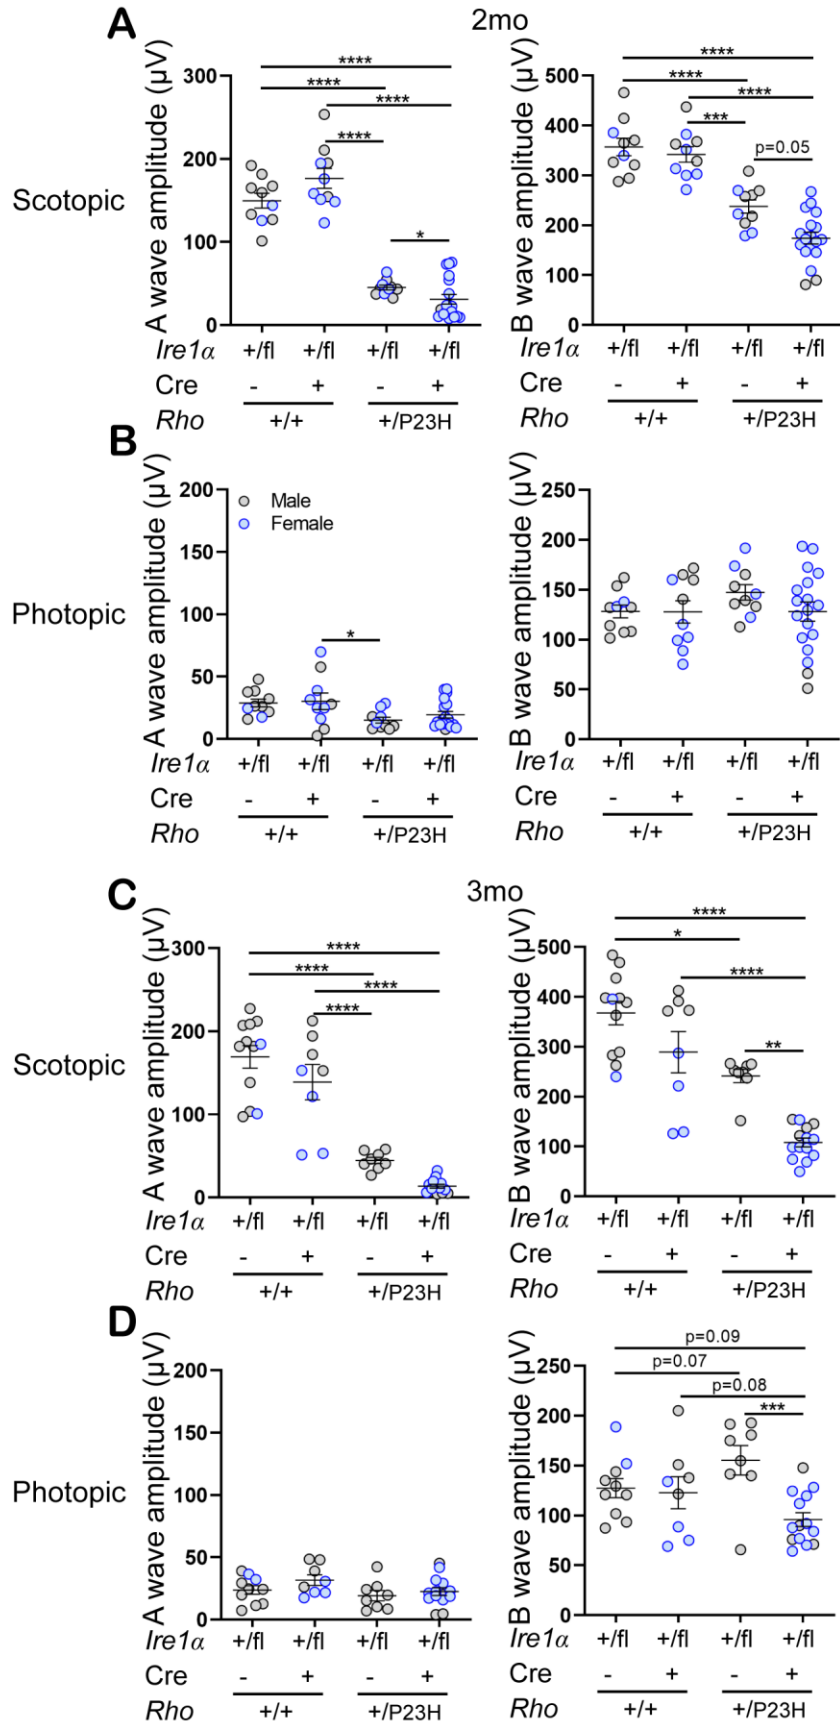

Fig. S6: IRE1 α deficiency in rod photoreceptors tends to exacerbate retinal functional deficits caused by *Rho*^{P23H} mutation and affects similarly males and females. (A and C) are scotopic ERGs recordings at 2, and 3 months respectively, showing decreased A wave and B wave responses of the *Rho*^{P23H} retinas that tends to be exacerbated by IRE1 α deficiency. (B and D) are photopic ERGs recordings at 2 and 3 months, respectively, that show no significant alteration with the exception of a small decrease in some of the B wave amplitudes (for A and B, n=10-18; for C and D, n=8-14). Similar distribution was observed between males and females. Data are presented as mean \pm SEM. *p < 0.05, **p < 0.01 *p < 0.001, ****p < 0.0001; two-way ANOVA.**
