## S2 Table. Example of contact to authors

Dear Dr. Nicola Colacurci,

We are currently working on a systematic review, and came across your study on: "Raloxifene slows down the progression of intima-media thickness in postmenopausal women". Do you have any fracture data from this study, and if so would you be willing to share this data?

#### Many thanks.

#### Best regards

Mina Nicole Händel, MSc, PhD Research Unit for Dietary Studies at The Parker Institute Frederiksberg Hospital Nordre Fasanvej 57, Vej 8, indgang 11 2000 Frederiksberg Denmark

Email: mina.nicole.holmgaard.handel@regionh.dk

# S4 Table. Characteristics of included studies

Note: [Ordered by trial (when applicable), alphabetically and year of publication] The information hereby presented has been copied from the original article or adapted.

## **General list** Adachi 2009 RCT, parallel group Methods 34 centers in Canada and Columbia 438 women were randomized and 367 completed the study Inclusion criteria: postmenopausal women (at least 6 months after their last menstrual period) and at least 40 years of age (or ≥25 years if surgically menopausal). Patients were included if they had either a history of osteoporotic fracture or a bone mineral **Participants** density <2.0 SDs below the mean for young adults, as assessed using dual-energy X-ray absorptiometry performed within 3 years before randomization. Patients were required to have an adequate intake of vitamin D and calcium through diet and/or supplements, as determined by the study investigator based on information obtained during the screening process. Intervention: alendronate 10 mg, once daily for 12 weeks (N=291) Interventions Control: placebo, once daily for 12 weeks (N=147) Outcomes Non-vertebral fractures

#### Adami 2008

Methods	RCT, parallel group 32 clinical centers in seven countries (the United States, France, Germany, Spain, Italy, Canada, and Australia)
	Inclusion criteria: Ambulatory postmenopausal women 50 to 80 years of age who were at least 5 years postmenopausal that had a BMD T-score below –2.5 at the lumbar spine and/or the femoral neck.
Participants	Exclusion criteria: Women were excluded from the study if they had diseases other than osteoporosis which affected bone metabolism or responses to therapy or if they reported use of any of the following treatments at baseline: calcitonin within 2 months; estrogens, SERMs or tibolone within 3 months; >0.3 mg conjugated estrogen or equivalent for more than three doses per week within 3 months; androgens or anabolic steroids within 6 months; fluorides within 2 years; oral bisphosphonates for more than 2 consecutive months within previous 6 months or intravenous bisphosphonates within 6 months; vitamin D >50,000 IU/week or any use of calcitriol or vitamin D analogs within 6 months; systemic corticosteroids within 1 month or more than 30 days within previous 12 months; any drugs known to affect bone metabolism within 6 months; or investigational drugs within 1 month.
Interventions	Intervention: A one-month run-in period was followed by three consecutive one-year treatment phases. Patients received open-label recombinant teriparatide 20 μg once- daily by subcutaneous self-injection in the first year. Then one year of raloxifene 60 mg/day as a tablet taken orally followed by one year of open label raloxifene 60 mg/day (N=157)

Control: A one-month run-in period was followed by three consecutive one-year treatment phases. Patients received open-label recombinant teriparatide 20 µg oncedaily by subcutaneous self-injection in the first year. Then one year of oral placebo as a tablet taken orally followed by one year of open-label raloxifene 60 mg/day (N=172)

Outcomes Clinical and non-vertebral fractures

#### Anastasilakis 2015

Methods	RCT, parallel group Outpatient clinics in Greece
Participants	N=64, from which 58 completed the study Inclusion criteria: Postmenopausal Caucasian women with low bone mass (bone mineral density [BMD] T-score of ≤–2.0 at the lumbar spine [LS] and/or the non- dominant femoral neck [FN]) who had been subjected to a single zoledronic acid infusion for the first time 1 year ago were included in the study. Exclusion criteria: Exclusion criteria for both groups were as follows: (i) age <40 years; (ii) any bone and mineral disorder other than osteoporosis, including primary or secondary hyperparathyroidism, Paget's disease of bone, osteogenesis imperfecta, rheumatologic diseases, paraplegia, and chronic immobilization; (iii) severe liver or kidney disease (creatinine clearance <60 ml/min/1.73 m2) or liver or kidney transplantation; (iv) premature ovarian failure; (v) uncontrolled thyroid disease; (vi) any malignancy; (vii) any musculoskeletal injury or surgical procedure 6 months prior to baseline; (viii) dental surgery or tooth removal 3 months prior to baseline or plan to dental surgery; (ix) history or concomitant medications that could affect bone metabolism, including immunosuppressive, anticonvulsant, antiviral and anti- tuberculosis agents, addictive drugs, corticosteroids, non-steroidal anti-inflammatory drugs, amiodarone, thiazolidinediones, interferon, metronidazole, and tamoxifen.
Interventions	Intervention 1: denosumab 60 mg, subcutaneous injections every 6 months (N=32) Intervention 2: zoledronic acid 5 mg, intravenous infusion (N=26)
Outcomes	Clinical fractures

## Ascott Evans 2003

Methods	RCT, parallel group 18 centers in 9 countries
Participants	<ul> <li>N=144, from which 119 women completed the study</li> <li>Intervention: 92.6% Caucasian</li> <li>Control: 89.8% Caucasian</li> <li>Inclusion criteria: Women were eligible for enrollment if they were younger than 80 years, had been postmenopausal for at least 3 years, had used HRT for at least 1 year, and had discontinued HRT within the3 months preceding their joining the study. In addition, patients had to have a low bone density defined as a lumbar spine T score between -3.5 and -1.5 (approximately 1.5 to 3.5 SDs below the mean BMD for healthy young women).</li> <li>Exclusion criteria: Patients were excluded from participation if they had a history of other metabolic bone disease or osteoporotic fracture, or if they had recently received</li> </ul>

	bisphosphonate or other treatments (such as glucocorticoid therapy) known to affect bone metabolism.
Interventions	Treatment duration: 12 months Intervention: alendronate sodium 10 mg per day (N=95) Control: placebo, daily (N=49)
Outcomes	Vertebral, non-vertebral and hip fractures

#### Barrett-Connor 2006

	RUTH (the Raloxifene Use for The Heart trial): a RCT, parallel group
Methods	177 sites in 26 countries
	(ClinicalTrials.gov number, NCT00190593.)
	10101 women underwent randomization
Participants	Inclusion criteria: Eligible women were 55 years of age or older, were one year or more postmenopausal, and had established CHD or were at increased risk for CHD. Participants were required to have a cardiovascular risk score of 4 or more, according to a point system that takes into account the presence of the following14: established CHD (4 points), arterial disease of the leg (4 points), an age of at least 70 years (2 points), diabetes mellitus (3 points), cigarette smoking (1 point), hypertension (1 point), and hyperlipidemia (1 point).
	Exclusion criteria: Exclusion criteria were a myocardial infarction, coronary-artery bypass grafting, or percutaneous coronary intervention within three months before randomization; a history of cancer or venous thromboembolism; a life expectancy of less than five years; unexplained uterine bleeding within six months before randomization; New York Heart Association class III or IV heart failure; chronic liver or renal disease; use of oral or transdermal estrogens within six months before randomization; or current use of other sex hormones or SERMs.
Interventions	Intervention: raloxifene 60 mg/d (N=5044) Control: placebo, daily (N=5057)
Outcomes	Vertebral and non-vertebral

## Bell 2002

Methods	RCT, parallel group 8 institutions geographically distributed across the United States
Participants	N=65 Inclusion criteria: African-American postmenopausal women aged 45–88 yr, otherwise healthy, and a BMD 0.86 g/cm2 or less (T score range -1.75 or less) at the lumbar spine as measured by model QDR 1000, QDR 1000W, or QDR 2000 bone densitometers (Hologic, Inc., Waltham, MA).
	Exclusion criteria: women with any disease or drug therapy potentially affecting bone metabolism or who had had more than one fracture of a lumbar spine vertebra were excluded. Other exclusion criteria included abnormal renal function or a history of cancer or major upper gastrointestinal mucosal erosive disease.
Interventions	Treatment duration: 2 years Intervention: alendronate 10 mg/day (N=33)

	Control: placebo, daily (N=32)
Outcomes	Clinical fractures
Bock 2012	
Methods	RCT, parallel group with 1-year follow-up period (clinical trial registration number NCT00271713; www.clinicaltrials.gov)
Participants	Inclusion criteria: y women aged between 60 and 75 years, with menopause more than 5 years ago, measurable spine and hip BMD (e.g. no severe degenerative changes) by dual X-ray absorptiometry (DXA), spine (L1–L4) or total hip BMD ≤–2.0 and >–3.5 SD T-score measured on DXA. Exclusion criteria: Exclusion criteria included spine or hip BMD ≤–3.5 SD T-score as measured by DXA, vertebral fractures or multiple (>2) low trauma peripheral fractures (as measured on lateral radiographs of thoracic and lumbar spine), diseases or disorders known to influence bone metabolism, a history of major upper gastro- intestinal disease, diagnosed malignant disease within the previous 10 years, previous treatment with a bisphosphonate at any time, treatment with fluoride for osteoporosis (dose greater than 10 mg/day) within the last 12 months or for more than 2 years (total duration), treatment with parathyroid hormone and similar agents or strontium ranelate at any time, treatment with other drugs affecting bone metabolism within the last 6 months, chronic systemic corticosteroid treatment, prior or current treatment with estrogens, progestins, SERMs, anabolic steroids, active vitamin D analogs/metabolites, calcitonin, calcineurin inhibitors or methotrexate, total serum calcium <2.2 mmol/l or >2.6 mmol/l, vitamin D deficiency (serum 25- hydroxyvitamin D <12 ng/ml), ALT above triple upper limit of normal range, renal impairment (serum creatinine >210 µmol/l) or any of the contraindications for

	Intervention: 150 mg ibandronate oral monthly (N=36)
Interventions	Control: placebo oral monthly (N=34)
	All subjects received 500 mg calcium and 400 I.U. vitamin D daily.
Outcomes	Vertebral and non-vertebral fractures

## Body 2002

Methods	RCT, parallel group 12 sites in the United States, Austria, Belgium, Canada, Israel and Mexico
	Inclusion criteria: Ambulatory postmenopausal women at least 5 yr past menopause were eligible to participate if they were aged 30 – 85 yr, free of severe or chronically disabling conditions other than osteoporosis, and had LS or femoral neck bone mineral density at least 2.5 SD below the mean for young adult women.
Participants	<ul> <li>Exclusion criteria: Women were excluded for metabolic bone disorders; diseases affecting bone and mineral metabolism; carcinomas within the previous 5 yr.; nephrolithiasis or urolithiasis within the previous 2 yr.; malabsorption; significantly impaired renal [serum creatinine concentrations, 177 mol/liter (2.0 mg/dl)] or hepatic function; abnormalities of the LS prohibiting assessment of bone mineral density at L2-L4; medications or drugs known to affect bone or mineral metabolism in the prior 2 – 24 months depending on the drug (e.g. androgens, anabolic steroids, bisphosphonates, calcitonin, glucocorticoids, estrogens, fluoride); alcohol abuse; or allergy or previous exposure to teriparatide, exogenous PTH, or PTH analogs.</li> </ul>

Interventions	Treatment duration: 24 months
	Intervention: once-daily subcutaneous injection teriparatide 40 μg plus oral placebo (N=73)
	Control: once-daily placebo injection plus oral 10 mg alendronate sodium (N=73)
Outcomes	Non-vertebral fractures

Bone 1997

Methods	RCT, parallel group 15 clinical sited in the United States
Participants	Inclusion criteria: Subjects were required to be in generally good health apart from osteoporosis. Patients were accepted for entry if lumbar spine BMD was 0.824 g/cm2 or less by Hologic DXA or 0.944 g/cm2 or less by Lunar DXA. These densities correspond to 2.0 SD below mean peak levels. Exclusion criteria: Potential subjects were excluded if they had more than 1 lumbar crush fracture or spinal anatomy was otherwise unsuitable for DXA analysis. They were also excluded if they had a history of recent major gastrointestinal disease, such as peptic ulcer, esophageal disorder, or malabsorption, or had recently used a drug to inhibit gastric acid secretion for more than 2 weeks. In addition, patients receiving chronic nonsteroidal anti-inflammatory therapy or agents known to affect bone metabolism (such as etidronate, estrogen, glucocorticoids, fluoride, or calcitonin) were excluded. Subjects receiving thyroid hormone replacement were required to have been on a stable dosage for at least 6 months before entry into the study and euthyroid by ultrasensitive TSH assay. Clinically significant vitamin D deficiency was
	similarly excluded or corrected.
Interventions	Treatment duration: 2 years Intervention 1: alendronate 1.0 mg/day (N=86) Intervention 2: alendronate 2.5 mg/day (N=89) Intervention 3: alendronate 5.0 mg/day (N=93) Control: placebo, daily (N=91)
Outcomes	Vertebral and non-vertebral fractures

Bone 2000

Methods	2 year RCT, parallel group Multicenter
Participants	<ul> <li>N=425, 92% Caucasians</li> <li>Inclusion criteria: Entry criteria included prior hysterectomy and a lumbar spine BMD below 0.862 g/cm2 for at least three evaluable vertebrae in the L1—L4 region, as measured by Hologic, Inc., densitometry equipment (Waltham, MA). Compared with the current reference range, the mean BMD (0.77 6 0.07 g/cm2) observed in the patients enrolled corresponds to a mean t score of 22.5 6 0.2. The study was limited to women who had undergone hysterectomy to avoid any possible confounding effects of progestin therapy or withdrawal bleeding.</li> <li>Exclusion criteria: Exclusion criteria included evidence of metabolic bone disease (other than postmenopausal osteoporosis), a low serum 25-hydroxyvitamin D concentration [,10 ng/mL (25 nmol/L)], concomitant therapy with drugs that affect</li> </ul>

	bone turnover (including bisphosphonates, calcitonin, or fluoride), renal insufficiency, severe cardiac disease, or history of recent major upper gastrointestinal mucosal erosive disease (including significant upper gastrointestinal bleeding, recurrent peptic ulcer disease, and esophageal or gastric varices). However, a history of other gastrointestinal diseases or chronic use of nonsteroidal anti-inflammatory agents were not considered reasons for exclusion. Women were not eligible for entry into the study if they had an underlying condition that would contraindicate randomization to estrogen, including active thrombophlebitis or history of prior thromboembolic disease, history of unexplained genital bleeding within the preceding year, increased risk for breast cancer, or fasting serum triglycerides more than 400 mg/dL. Women were also excluded from entering the study if within 6 months before entry into the study they had taken any form of systemic HRT.
Interventions	Intervention 1: alendronate (alendronate (10 mg/day) and placebo CEE) (N=92) Intervention 2: CEE (CEE (0.625 mg/day) and placebo alendronate) (N=143) Intervention 3: ALN + CEE (alendronate (10 mg/day) and CEE (0.625 mg/day)) (N=140) Control: placebo (placebo alendronate/placebo conjugated equine estrogen) (N=50)
Outcomes	Clinical fractures

#### Bone 2008

Methods	2-year RCT, phase 3 study 21 centers in Canada and United States
Participants	<ul> <li>332 women enrolled in the study and 83% were white</li> <li>286 completed the 24 months of treatment (86%)</li> <li>Inclusion criteria: postmenopausal women with lumbar spine BMD Tscores between -</li> <li>1.0 and -2.5 who were: 1) ambulatory, 2) not receiving medication that affected bone metabolism (other than calcium and vitamin D supplements), 3) free from any underlying condition (other than low BMD) that might have resulted in abnormal bone metabolism, and 4) had no history of a fracture after the age of 25 years. Women who had taken oral bisphosphonates for less than 3 months were eligible. Those who had taken oral bisphosphonates for longer than 3 months but less than 3 yr cumulatively were eligible after a 12-month washout period.</li> <li>Exclusion criteria: Women were excluded if they had received oral bisphosphonates for 3 or more yr, cumulatively; fluoride, or strontium ranelate within 5 yr. of study enrollment; or PTH or PTH derivatives, steroids, hormone replacement therapy, selective estrogen receptor modulators, tibolone, calcitonin, or calcitriol within 6 wk of study enrollment.</li> </ul>
Interventions	Treatment duration: 2 years Intervention: Denosumab 60 mg, subcutaneous injection every 6 months (N=142) Control: placebo, subcutaneous injection every 6 months (N=144)
Outcomes	Vertebral and non-vertebral fractures

## Brown 2009

Methods	DECIDE (Determining Efficacy: Comparison of Initiating Denosumab versus Alendronate) trial: a phase-3 RCT, parallel group
	Multicenter; Western Europe, North and South America, and Australia

Participants	<ul> <li>1189 included in the study; 94% of them completed 12 months of study</li> <li>Inclusion criteria: Ambulatory postmenopausal women in general good health and with a T-score – 2.0 at the proximal femur ("total hip") or lumbar spine by DXA were eligible. Subjects were required to have at least one hip and at least two vertebrae (L 1 –L4) that were evaluable by DXA.</li> <li>Exclusion criteria: exclusion criteria included prior administration of intravenous bisphosphonates, fluoride (except for dental treatment) or strontium; use of drugs with known bone activity within 3 mo of randomization; current enrollment in or &lt;1 mo since completion of other drug trials; evidence of an active disease known to affect bone metabolism; malignancy within the past 5 yr (except basal or squamous cell carcinoma or cervical or breast cancer in situ); impaired renal function; or contraindications for alendronate therapy. Subjects with screening serum 25-hydroxyvitamin D [25(OH)D] concentrations &lt;12 ng/ml were ineligible but could undergo vitamin D repletion with ergocalciferol for 2 wk. and be rescreened.</li> </ul>
Interventions	Treatment duration: 12 months Intervention: 1 ml subcutaneous injection of denosumab 60 mg every 6 months plus an oral placebo tablet once weekly Control: 1 ml subcutaneous injection of placebo every 6 months plus oral branded alendronate 70 mg weekly
Outcomes	Clinical and major osteoporotic fractures

#### Brown 2021

Methods	The Active-Controlled Fracture Study in Postmenopausal Women With Osteoporosis at High Risk (ARCH) trial (NCT01631214; <u>https://clinicaltrials.gov/ct2/show/NCT01631214</u> ): a phase 3, multi-center, international, randomized, active-controlled, double-blind study.
Participants	<ul> <li>ARCH enrolled 4093 patients (2046 romosozumab, 2047 alendronate); 167 of these patients were enrolled in the ARCH imaging substudy (Supplemental Figure S4). Of the patients in the imaging substudy, 90 (49 romosozumab, 41 alendronate) participated.</li> <li>Inclusion criteria: postmenopausal women with low BMD (T-score≤2.5) and a prior fragility fracture.</li> <li>Exclusion criteria: Patients were ineligible for the ARCH imaging substudy if they experienced a nonvertebral fracture or clinical vertebral fracture within 6 months before enrollment or had non-evaluable vertebrae in the region of interest for spine QCT scans as assessed by the central imaging vendor at the time of screening, based on lateral spine x-rays.</li> </ul>
Interventions	Double-blind treatment period: 12 months Intervention 1: monthly s.c. romosozumab 210 mg (N=49) Intervention 2: weekly oral alendronate 70 mg (N=41) After completion of the double-blind study period, all patients received open-label weekly oral alendronate 70 mg.
Outcomes	Vertebral fractures

Clemmesen 1997

Methods	RCT, parallel group

	2 sites: Copenhagen County, Denmark and Liège, Belgium
Participants	N=132 Inclusion criteria: otherwise healthy postmenopausal women, 53–81 years of age (mean age 68 years) and at least 1 year past the menopause, with established postmenopausal osteoporosis defined as at least one, but no more than four vertebral fractures, and at least three intact lumbar vertebrae. Exclusion criteria: None of the women had received estrogen or calcitonin treatment within the 6–12 months prior to entrance in the study or had ever received any kind of bisphosphonate or fluoride. All women were otherwise healthy with no secondary causes of osteoporosis. None of the women received medications with known influence on bone metabolism.
Interventions	Treatment duration: 2 year Intervention 1: risedronate 2.5 mg daily (N=44) Intervention 2: risedronate 2.5 mg daily for 2 weeks followed by 10 weeks on placebo (N=44) Control: placebo, daily (N=44)
Outcomes	Vertebral and non-vertebral fractures

### Cosman 2001

Methods	RCT, parallel group Osteoporosis clinic and osteoporosis screening program in the USA
Participants	N=52 Inclusion criteria: the presence of primary postmenopausal osteoporosis, defined as a T score of 2.5 below the normal premenopausal mean in either the spine or hip region and/or X-ray–documented osteoporotic vertebral fracture. Furthermore, all women had been on HRT for at least 1 year before study entry and were followed prospectively for 1 year to assure that bone density was stable. No patients were excluded because of bone loss. Consequently, all patients were on HRT for at least 2 years before randomization. Exclusion criteria: secondary causes of osteoporosis or medications (other than HRT) known to affect bone metabolism. Active renal calculus disease with a renal stone within the last 10 years or multiple prior renal stones.
Interventions	All patients were on HRT for at least 2 years before randomization. Treatment duration: 3 years Intervention: hormone-replacement therapy in addition to 400 IU/day (25 μg) of PTH(1–34) by subcutaneous daily injection. (N=27) Control: hormone-replacement therapy (N=5)
Outcomes	Clinical and vertebral fractures

### Cosman 2005

Methods	RCT, parallel group Osteoporosis clinic and osteoporosis screening program in the USA
Participants	N=126 women with osteoporosis who had been taking alendronate for at least 1 year were randomized.

	<ul> <li>Inclusion criteria: Normal levels of serum creatinine, total calcium (upper limit, 10.6 mg per deciliter [2.65 mmol per liter]), parathyroid hormone, and thyrotropin; normal liver function and complete blood count; and a ratio of urinary calcium to creatinine of less than 0.35 mg per milligram (1.0 mmol per millimole) after an overnight fast were prerequisites</li> <li>Exclusion criteria: Exclusion criteria included rheumatoid arthritis, multiple prior renal stones or a kidney stone within the preceding five years, or current use of glucocorticoids, antiepileptic medications, or estrogen. Subjects were required to have</li> </ul>
	a bone mineral density T score of –2.5 or less at the lumbar spine (two or more vertebrae could be evaluated), femoral neck, or total hip or a T score of –2 or less at any of these sites plus a history of fracture in adulthood (defined as an age of at least 40 years) or vertebral fracture (identified by radiography), but excluding fractures caused by trauma (motor vehicle accidents) and finger, toe, and skull fractures.
	Treatment duration: 15 months Intervention 1: daily subcutaneous parathyroid hormone 25 μg plus alendronate 70 mg weekly (N=43)
Interventions	Intervention 2: cyclic subcutaneous parathyroid hormone 25 $\mu$ g (each treatment cycle lasted three months and was followed by three months without parathyroid hormone) plus alendronate70 mg weekly (N=40)
	Intervention 3: alendronate 70 mg weekly (N=43)
Outcomes	Vertebral, non-vertebral and hip fractures

## Cosman 2009

Methods	Randomized open-label trial (ClinicalTrials.gov Identifier: NCT00079924)
	11 centers in the USA
Participants	11 centers in the USA N=198, 84% completed the study Inclusion criteria: Women were required to be postmenopausal and at least 50 yr old and to have had a previous diagnosis of osteoporosis based on fracture history and/or BMD. Women had to be on alendronate (70 total mg/wk.) or raloxifene (60 mg/d) for at least 18 months and be willing to continue or discontinue the alendronate or raloxifene, based on randomization, during the 18-month teriparatide treatment phase of the trial. Participants had to be on al least 1 month of stable calcium supplementation (at least 500 mg/d elemental calcium).At least two vertebrae in the lumbar region (L-1 through L-4) were required to be evaluable by DXA. A posterior-anterior lumbar spine BMD and/or hip BMD measurement via Hologic (Ho-logic Inc., Bedford, MA) or Lunar (GE Medical Systems, Madison, WI) densitometers equal to or lower than 2.0 SD values below the average bone mass for young women (BMD T-score <= -2.0) was required. Serum calcium values had to be within the normal range (8.9–10.1 mg/dl). Laboratory assessments including 25-hydroxyvitamin D, intact PTH, alkaline phosphatase, and TSH had to be normal or assessed as clinically insignificant. Exclusion criteria: Women were excluded if they had a history of hypercalcemia (with the exception of surgically corrected hyperparathyroidism), metabolic bone diseases other than osteoporosis, secondary causes of osteoporosis, or malignant neoplasms within the past 5 yr. Women were also excluded if they had active urolithiasis within the past 2 yr or high risk for urolithiasis in the opinion of the investigator; prior radiation therapy involving the skeleton; active liver disease (liver enzymes more than three times upper limit of normal) or jaundice; substantially impaired renal function (serum creatinine > 1.8 mg/dl); history of excessive alcohol consumption; or were treated with other bone-active drugs.

All postmenopausal women were treated with alendronate or raloxifene for at least 18 months before study entry.
Treatment duration: 18 months
Alendronate pretreated stratum
Intervention 1: switch group – discontinue alendronate 10 mg/day or 70 mg/week and initiated teriparatide 20 $\mu g$ by daily subcutaneous injection (N=50)
Intervention 2: add group – continue alendronate 10 mg/day or 70 mg/week and initiated teriparatide 20 $\mu$ g by daily subcutaneous injection (N=52)
Raloxifene pretreated stratum
Control 1: switch group – discontinue raloxifene 60 mg/day and initiated teriparatide 20 μg by daily subcutaneous injection (N=49)
Control 2: add group – continue raloxifene 60 mg/day and initiated teriparatide 20 $\mu g$ by daily subcutaneous injection (N=47)
Clinical fractures

## Cosman 2011

Methods	1-year RCT, parallel group (ClinicalTrials.gov number, NCT00439244).
Methods	Multicenter
Participants	N=412, the majority was white (96-98%). Inclusion criteria: Eligible participants were postmenopausal women aged 45 to 89 years with BMD T-scores of 2.5 or less at the femoral neck, total hip, or lumbar spine or a BMD T-score of 2.0 or less at any site plus one or more documented vertebral or nonvertebral fractures (not due to excessive trauma, as determined by individual investigators). Exclusion criteria: Women were excluded for any prior use of PTH or bisphosphonates for more than 3 consecutive months; shorter-term use was acceptable if followed by a 1-year washout. Other ineligibility criteria included prior strontium treatment; chronic use of systemic corticosteroids within the prior year; raloxifene, calcitonin, or hormone therapy within the prior 3 months; creatinine clearance < 30 mL/min (assessed by estimated glomerular filtration rate [Cockcroft-Gault equation]); urine dipstick 2b protein; serum calcium 2.75 mmol/L or <2.0 mmol/L; or 25-hydroxyvitamin D levels < 15 ng/mL.
Interventions	Intervention 1: single intravenous infusion of zoledronic acid 5mg plus daily teriparatide 20 μg via subcutaneous injection (N=137) Intervention 2: single intravenous infusion of zoledronic acid 5mg (N=137) Control: placebo infusion plus daily teriparatide 20 μg. (N=138)
Outcomes	Clinical fractures
Cosman 2020	
Methods	Post hoc analysis was based on the Active-Controlled Fracture Study in Postmenopausal Women With Osteoporosis at High Risk (ARCH) (Clinical TrialNCT01631214), a phase 3, multicenter, international, randomized, active- controlled, double-blind study.
Participants	Inclusion criteria and Exclusion criteria: not provided. (Please see Brown 2021)

Interventions	Double-blind treatment period: 12 months
	Intervention 1: monthly s.c. romosozumab 210 mg (N=1739)
	Intervention 2: weekly oral alendronate 70 mg (N=1726)
	After completion of the double-blind study period, all patients received open-label weekly oral alendronate 70 mg.
Outcomes	Clinical, vertebral, non-vertebral and hip fractures

#### Downs Jr. 2000

Methods	Prospective, randomized study
Participants	<ul> <li>Conducted at 24 centers across the United States</li> <li>97% women were Caucasian</li> <li>Inclusion criteria: ambulatory women at least 5 yr. post menopause with osteoporosis.</li> <li>Patients were required to have a BMD by dual-energy x-ray absorptiometry (DXA) at least 2 SD below the mean for a reference population of young women [based on the reference database provided by Hologic, Inc. (Waltham, MA)] at either the PA lumbar spine or femoral neck and, in addition, a BMD measurement at least 1 SD below the young normal mean at the other site. These criteria identify women who would be among the appropriate candidates for therapeutic intervention according to the National Osteoporosis Foundation guidelines. A history of a gastrointestinal disorder (other than an esophageal motility disorder) or use of a nonsteroidal anti-inflammatory agent was not a reason for exclusion.</li> <li>Exclusion criteria: Patients with a BMD more than 4 SD below the young normal mean at either the PA lumbar spine or femoral neck, a prevalent vertebral fracture on lateral thoracic or lumbar spine radiographs, or a history of minimal trauma hip fracture were excluded due to the use of a placebo in this study. Patients were also excluded for any of the following: active rheumatoid arthritis, disorders of bone mineralization, untreated hyperthyroidism, recent systemic estrogen therapy, hypercortisolism, or use</li> </ul>
	of drugs known to alter bone or calcium metabolism.
Interventions	Half as many patients were randomized to the placebo group as were randomized to the alendronate and calcitonin groups (2:2:1, alendronate:calcitonin:placebo) Intervention 1: oral alendronate sodium (N=118) Intervention 2: open-label intranasal calcitonin-salmon (N=123) Control: matching alendronate placebo (N=58)
Outcomes	Clinical fractures

#### Dursun 2001

Methods	RCT, parallel group Turkey
Participants	151 participants included in the study Inclusion criteria: Postmenopausal women. Required to have a BMD of 2 SD or more below the young adult mean at either the posteroanterior lumbar spine or the femoral neck.
	Exclusion criteria: Women with a documented history of drug or alcohol abuse or with evidence from physical examinations, laboratory test or radiography of any bone metabolism disorder; active gastrointestinal or liver disease, renal failure, renal calculi,

	treatment with specific therapy for osteoporosis, treatment with systemic corticosteroid therapy, malignancy, disorder of calcium metabolism and lumbar vertebrae abnormalities preventing evaluation of BMD.
Interventions	Participants were randomized to receive daily for 1 year one of this 3 treatments: Intervention 1: oral alendronate 10 mg and calcium 1000 mg (N=51) Intervention 2: intranasal salmon calcitonin 100 IU and oral calcium 1000 mg (N=50) Control: oral calcium 1000 mg (N=50)
Outcomes	Vertebral fractures
Ensrud 2008	
	RUTH (the Raloxifene Use for The Heart trial): a RCT, parallel group
Methods	Follow up: median of 5.6 years 177 sites in 26 countries
Methods Participants	
	<ul> <li>177 sites in 26 countries</li> <li>Inclusion criteria: eligible women were ≥55 yr of age, ≥1 yr postmenopausal, and had established CHD or were at high risk for CHD.</li> <li>Exclusion criteria: myocardial infarction, coronary-artery bypass grafting, or percutaneous coronary intervention within three months before randomization; a history of cancer or venous thromboembolism; a life expectancy of less than five years; unexplained uterine bleeding within six months before randomization; New York Heart Association class III or IV heart failure; chronic liver or renal disease; use of oral or transdermal estrogens within six months before randomization; or current use</li> </ul>

## Fogelman 2000

Methods	RCT, parallel group 13 centers in France, UK, Netherlands, Belgium and Germany.
Participants	<ul> <li>543 women were enrolled; 355 completed 24 months of treatment</li> <li>Inclusion criteria: Women up to 80 yr of age were eligible to participate in the study if they had been postmenopausal for at least 1 yr, based on the date of their last menstrual period, and had a mean lumbar spine (L1–L4) T-score of -2 or less. Prior or concomitant use of non-steroidal anti-inflammatory drugs (NSAIDs) or aspirin was permitted. Patients with previous or ongoing upper gastrointestinal disease were not excluded.</li> <li>Exclusion criteria: Patients were excluded from the study if they had hyperparathyroidism, hyperthyroidism, or osteomalacia within a year before the study; a history of cancer; or abnormalities that would interfere with the measurement of lumbar spine BMD by dual-energy x-ray absorptiometry (DXA).</li> <li>Patients were also excluded if they had taken (within 6–12 months, depending on the medication) or were still taking treatment known to affect bone metabolism, including an injection of vitamin D ≥ 10,000 IU.</li> </ul>
Interventions	Treatment duration: 24 months; 2.5 mg group was discontinued by protocol amendment at 9 of the 13 centers

	Intervention 1: risedronate 2.5 mg per day (N=184)
	Intervention 2: risedronate 5 mg per day (N=177)
	Control: placebo, daily (N=180)
Outcomes	Vertebral and non-vertebral fractures

## Freemantle 2012

Methods	DAPS (the Denosumab Adherence Preference Satisfaction Trial): a RCT, crossover (registered in ClinicalTrials.gov under the identifier NCT00518531) 20 centers in the USA and 5 centers in Canada
Participants	250 women were enrolled in the study; 221 entered the 2 <sup>nd</sup> year Inclusion criteria: Subjects enrolled were ambulatory, postmenopausal women, aged 55 years or older, with baseline BMD T-scores between –4.0 and –2.0 at the lumbar spine, total hip, or femoral neck as measured by dual energy X-ray absorptiometry. Exclusion criteria: Key exclusion criteria were prior bisphosphonate or denosumab treatment, use of bone-active drugs, vitamin D deficiency (<20 ng/mL [49.9 nmol/L]), or contraindications to alendronate treatment.
Interventions	Treatment sequence 1: denosumab/alendronate - denosumab 60 mg every 6 months for 1 year during the 1 <sup>st</sup> year of the study, followed by alendronate 70 mg once a week for 1 year during the 2 <sup>nd</sup> year of the study (N=118) Treatment sequence 2: alendronate/denosumab - alendronate 70 mg once a week for 1 year during the 1 <sup>st</sup> year of the study, followed by denosumab 60 mg every 6 months for 1 year during the 2 <sup>nd</sup> year of the study (N=125)
Outcomes	Clinical fractures

#### Galesanu 2018

Methods	RCT, parallel group
Participants	Inclusion criteria: Postmenopausal women with osteoporosis. Exclusion criteria:
Interventions	Treatment duration: 2 years Intervention: denosumab 60 mg, subcutaneously every 6 months (N=32) Intervention 2: zoledronic acid 5 mg, intravenously once yearly (N=30)
Outcomes	Clinical fractures

#### Greenspan 1998

Methods	RCT, parallel group United States, Greater Boston areas
Participants	N=120 Inclusion criteria: unselected healthy, ambulatory, community-dwelling women age 65 years of age and older from the Greater Boston area via advertisement. Entry criteria were not based on BMD. The inclusion criteria for the present study were more relaxed, allowing for characteristic medical problems closer to those that exist in the general population of community-dwelling elderly women.

	Exclusion criteria: Potential subjects were excluded if they had a history of any illness affecting bone and mineral metabolism (e.g., renal failure, hepatic failure, active malignancy, current hyperthyroidism or hyperparathyroidism, or malabsorption), were currently taking medications known to affect bone metabolism (e.g., glucocorticoids, anticonvulsants), or had been treated for osteoporosis with bisphosphonates, hormone replacement therapy, or calcitonin within 1 year of screening.
Interventions	Treatment duration: 2,5 years Intervention: alendronate 5mg/day; in the last year of the study the dose was increased to 10 mg/day (N=60) Control: placebo, daily (N=60)
Outcomes	Non-vertebral and hip fractures

#### Greenspan 2003

RCT, follow up: 3 years
United States, Greater Boston area (single-center)
N=373
<ul> <li>Inclusion criteria: community-dwelling women aged 65 or older.</li> <li>Exclusion criteria: Participants were excluded if they had a history of illnesses that could affect bone mineral metabolism (e.g., current hyperthyroidism or hyperparathyroid ism, renal failure, hepatic failure, and active malignancy) or if they were currently taking medications known to alter bone mineral metabolism (e.g., glucocorticoids, anticonvulsants, excess thyroid hormone). Participants were also excluded if they had been treated with osteoporosis medications (e.g., bisphosphonates, hormone replacement, or calcitonin) within a year of screening. In addition, women were excluded if they had any contraindications for hormone replacement or alendronate or had a baseline femoral neck BMD of 0.9 g/cm2 or greater (i.e., zero SD of mean peak BMD using Hologic database prior to the Third National Health and Nutrition Examination Survey database10).</li> </ul>
Intervention 1: alendronate + hormone replacement treatment placebo (N=93)
Intervention 2: alendronate + hormone replacement treatment (N=94)
Control 1: placebo (hormone replacement treatment placebo + alendronate placebo (N=93)
Control 2: hormone replacement treatment + alendronate placebo (N=93)
Women received alendronate sodium, 10 mg/d, or matching placebo. For hormone replacement, women who had had a hysterectomy were given 0.625 mg/d of conjugated equine estrogen or matching placebo, and women with an intact uterus received conjugated equine estrogen, 0.625 mg/d, with medroxyprogesterone, 2.5 mg/d, or matching placebo.
Clinical fractures

Methods	2 year RCT, parallel group New Zealand, conducted at an academic research center in a volunteer sample
Participants	N=50

	<ul> <li>Inclusion criteria: Participants were women more than 5 yr postmenopausal, with bone mineral density (BMD) T score between 1 and 2 at either lumbar spine or total hip.</li> <li>Exclusion criteria: Women who had illnesses or were receiving therapies that were known to affect the skeleton were ineligible, as were those with low bone mass (BMD T score at lumbar spine or total hip 2) or a previous hip or vertebral fracture, those who had ever used bisphosphonates, and those with any other major systemic disease.</li> </ul>
Interventions	Intervention: zoledronate 5 mg, given as a 15-min iv infusion in 100ml 0.9% NaCl (N=25) Control: placebo (100 ml 0.9% NaCl, administered in anidentical fashion) (N=25)
Outcomes	Clinical fractures

## Grey 2012

Methods	RCT, parallel group New Zealand, clinical research facility in a tertiary medical center ( <u>https://www.anzctr.org.au/Trial/Registration/TrialReview.aspx?id=82391</u> )
	180 women were randomized
	Data from 172 women were included in the analysis Inclusion criteria: Participants were women more than 5 yr postmenopausal, with BMD T-score between 1 and 2.5 at either lumbar spine or total hip.
Participants	Exclusion criteria: Women receiving antiresorptive therapies were ineligible, as were those with osteoporosis (BMD T-score at lumbar spine or total hip 2.5), a previous hip fracture, clinical vertebral fracture, or postmenopausal wrist fracture, those who had ever used an aminobisphosphonate or had used etidronate within the past 3 yr, those with any major systemic illness, and those with serum 25(OH)D below 25 nmol/liter.
	Intervention 1: zoledronate 1 mg, 15-min iv infusion in 100ml 0.9% NaCl, followed for 12 months (N=43)
Interventions	Intervention 2: zoledronate 2.5 mg, 15-min iv infusion in 100ml 0.9% NaCl, followed for 12 months (N=43)
	Intervention 3: zoledronate 5 mg, 15-min iv infusion in 100ml 0.9% NaCl, followed for 12 months (N=43)
	Control: placebo, 100 ml 0.9% NaCl administered in an identical fashion (N=43)
Outcomes	Clinical and non-vertebral fractures

# Hadji 2012

Methods	RCT, parallel group 78 clinical sites in 12 countries
Participants	710 women started the treatment Inclusion criteria: Women $\geq$ 45 years of age and at least 2 years postmenopausal were eligible if they had a history of back pain for $\geq$ 2 months before screening that was likely, in the opinion of the investigator, to be caused by osteoporotic vertebral fracture, despite conservative analgesic treatment; a baseline mean pain score of at least 4.0 on the numeric rating scale during the week before randomization; lumbar

	<ul> <li>spine, femoral neck, or total hip bone mineral density (BMD) T-score of ≤- 2; and a minimum of one moderate vertebral fracture.</li> <li>Exclusion criteria: Exclusion criteria included diseases affecting bone metabolism other than osteoporosis; elevated serum calcium values, abnormal serum thyroid-stimulating hormone, parathyroid hormone, or 25-hydroxyvitamin D levels; imminent need for kyphoplasty or vertebroplasty; and evidence of significant pathology related to back pain which would make the interpretation of the back pain related to an osteoporotic vertebral fracture difficult, based on investigator assessment</li> </ul>
Interventions	Treatment duration: 18 months Intervention: daily teriparatide 20 μg subcutaneous (SQ) injections plus placebo tablet orally once weekly (N=360) Control: placebo SQ injections plus risedronate 35 mg orally once weekly (N=350)
Outcomes	Vertebral, non-vertebral and hip fractures

# Hooper 2005

arallel group ters in Australia omen were randomized on criteria: The protocol specified that all were to have been postmenopausal termined from their medical histories) for 6 to 36 months, with a serum follicle ating hormone concentration of at least 50 mIU/ml and a serum estradiol netration of no more than 20 pg/ml. Menopause could be natural or surgical. Its who had undergone hysterectomy without bilateral oophorectomy could be ed if they were 51–60 years of age. All patients were required to have a lumbar BMD T-score greater than - 2.5 (BMD greater than 0.76 g/cm2 when measured Hologic densitometer (Waltham, Massachusetts, USA) or greater than 0.87 when measured with a Lunar densitometer (Madison, Wisconsin, USA)). All ts were in good health and had no history of hyperparathyroidism, hyroidism, or osteomalacia, or of treatment with agents that were likely to bone metabolism. Patients were not excluded because of previous or active
on criteria: The protocol specified that all were to have been postmenopausal termined from their medical histories) for 6 to 36 months, with a serum follicle ating hormone concentration of at least 50 mIU/ml and a serum estradiol intration of no more than 20 pg/ml. Menopause could be natural or surgical. Its who had undergone hysterectomy without bilateral oophorectomy could be ed if they were 51–60 years of age. All patients were required to have a lumbar BMD T-score greater than - 2.5 (BMD greater than 0.76 g/cm2 when measured Hologic densitometer (Waltham, Massachusetts, USA) or greater than 0.87 when measured with a Lunar densitometer (Madison, Wisconsin, USA)). All ts were in good health and had no history of hyperparathyroidism, hyroidism, or osteomalacia, or of treatment with agents that were likely to bone metabolism. Patients were not excluded because of previous or active
intestinal disease (including dysphagia, esophagitis, and esophageal, gastric, and nal ulceration), need for antisecretory therapy, or concomitant use of ations with potential to irritate the gastrointestinal tract.
nent duration: 2 years ention 1: risedronate 2.5 mg/day (N=127) ention 2: risedronate 5 mg/day (N=129) I: placebo (N=125)
ral and non-vertebral fractures

	Methous	Multicentre in Europe and the United States
ParticipantsInclusion criteria: To be eligible for the study they had to have been postmenopausa for at least six months (as confirmed by a high serum follicle-stimulating hormone	Participants	Inclusion criteria: To be eligible for the study they had to have been postmenopausal for at least six months (as confirmed by a high serum follicle-stimulating hormone

	<ul> <li>concentration) and in good health, with no clinical or laboratory evidence of systemic disease. To ensure that few women who entered the study had osteoporosis, only 10 percent of the women enrolled at each center were allowed to have a lumbar-spine bone mineral density be-low 0.8 g per square centimeter, as measured by dual-energy x-ray absorptiometry.</li> <li>Exclusion criteria: The following were exclusion criteria: abnormal renal function (serum creatinine, &gt;1.5 mg per deciliter [130 µmol per liter]), a history of cancer, peptic ulcer or esophageal disease requiring prescription medication within the previous five years, previous treatment with a bisphosphonate or fluoride, regular therapy with a phosphate-binding antacid, estrogen-replacement therapy within the previous three months, and therapy with any other drug that affects the skeleton.</li> </ul>
	There were two treatment strata. In the first, the women were randomly assigned to receive placebo or 2.5 mg or 5 mg of alendronate daily, with both the women and the investigator being unaware of treatment-group assignment, or open-label estrogen-progestin. Women who had undergone hysterectomy or for whom estrogen-progestin was contraindicated (because of thromboembolic disease or a family history of estrogen-dependent cancer) or unacceptable were enrolled in the second stratum, which was identical to the first except that it did not include estrogen-progestin.
Interventions	In the United States the estrogen and progestin were given as conjugated estrogens (Premarin, Wyeth–Ayerst, Philadelphia, 0.625mg daily), and medroxyprogesterone acetate (Provera, Upjohn, Kalamazoo, Mich., 5 mg daily), respectively. In Europe the estrogen and progestin were given in a cyclical regimen (Trisequens, Novo Nordisk, Copenhagen, Denmark) of 2 mg of micronized estradiol per day for 22 days, 1 mg of norethindrone acetate per day on days 13 to 22, and 1 mg of estradiol per day on days 23 to 28.Dietary calcium intake was estimated at base line and annually during the study with a food-frequency questionnaire. Women with a calcium intake of less than 500 mg per day were advised to increase their intake. Supplements were not provided, because of the limited evidence of benefit in women soon after menopause.
Outcomes	Non-vertebral fractures

Outcomes Non-vertebral fractures

## Hosking 2003

Methods	3 month RCT, parallel group Multicentre in Brazil and Europe
Participants	<ul> <li>549 women were randomized; 99.5% Caucasian</li> <li>Inclusion criteria: Postmenopausal (at least 2 years) women ≥ 60 and ≤ 90 years of age with osteoporosis as defined by low BMD (lumbar spine or total hip BMD Tscore ≤ -</li> <li>2.5, or both lumbar spine and total hip BMD Tscore ≤ -2.0) were eligible. Patients with an oesophageal stricture, achalasia, or severe oesophageal motor dysfunction were excluded, while patients with other recent but controlled gastrointestinal mucosal erosive disease were eligible. Use of non-steroidal anti-inflammatory drugs and proton pump inhibitors was allowed.</li> <li>Exclusion criteria: Patients were excluded from the study if they had a history of any</li> </ul>
	illness or if significant abnormalities were discovered during the prestudy clinical or laboratory evaluation that, in the opinion of the investigator, might compromise the patient's safety or the evaluation of the study results. Patients with osteoporosis, so severe that (in the judgment of the investigator) participation in a placebo-controlled trial was unethical, were excluded. Also excluded were patients with a baseline 25- hydroxyvitamin D level below 9 ng/ml, or below 15 ng/ml with biochemical evidence of osteomalacia: elevated parathyroid hormone or alkaline phosphatase or decreased

	24-h urine calcium. Patients with an oesophageal stricture, achalasia, or severe oesophageal motor dysfunction were excluded. Metabolic and other bone diseases were also reasons for exclusion. Prior concomitant medications excluded were: oestrogen preparations (> 2 weeks within 6 months), thyroid hormone (for less than 6 weeks before the study or with abnormal thyroid stimulating hormone), fluoride (>1 mg/day), glucocorticoids (>1 month within 6 months), bisphosphonate (> 2 weeks), and supplemental calcium (except if ongoing for >4 weeks).
Interventions	Intervention: risedronate 5 mg/day (N=222) Intervention: alendronate 70 mg once a week (N=219) Control: placebo (N=108)
Outcomes	Clinical fractures

#### Kendler 2010

Methods	The STAND (Study of Transitioning from Alendronate to Denosumab) trial: a 1-year phase 3 RCT, parallel group Multicenter, international
Participants	504 women were enrolled; 481 (95.4%) completed the 12 months follow-up Inclusion criteria: Ambulatory postmenopausal women at least 55 years of age with a lumbar spine or total hip BMD measurements corresponding to a T-score of -2.0 or less and -4.0 or greater and who had been receiving alendronate treatment equivalent to 70 mg/week for at least 6 months. Exclusion criteria: Women were excluded if they had current hyper- or hypothyroidism, current hyper- or hypoparathyroidism, elevated transaminases, significantly impaired renal function (creatinine clearance ≤35mL/min as estimated by the Cockcroft and Gault method), hyper- or hypocalcemia, serum 25-hydroxyvitamin D levels < 20ng/mL (< 50nmol/L) or any other condition that could result in impaired calcium metabolism, or any metabolic bone disease that could interfere with interpretation of the findings. Women who were intolerant of alendronate therapy or for whom it was contraindicated or who had taken any bisphosphonate other than alendronate within 1 year of screening also were excluded. Women were excluded if they had ever received intravenous bisphosphonates, fluoride (except for dental treatment), or strontium ranelate; had received parathyroid hormone (PTH) or PTH derivatives within 1 year; had received any Selective Estrogen Receptor Modulator (SERM), anabolic steroids, systemic hormone replacement, calcitonin, calcitriol, or other vitamin D derivatives within 3 months; or had height, weight, or girth measurements that precluded accurate dual- energy x-ray absorptiometry (DXA) assessments.
Interventions	Intervention: denosumab 60 mg, subcutaneous injections once every 6 months + placebo tablets once a week (N=253) Control: alendronate 70 mg once a week + placebo subcutaneous injections every 6 months (N=251)
Outcomes	Clinical fractures

### Kendler 2020

Methods	Post hoc analysis focused on denosumab/alendronate sequence	
---------	---	--

	Randomized, open-label, 2-year crossover Denosumab Adherence Preference Satisfaction (DAPS) study (NCT00518531). 25 study centers in the US and Canada
Participants	Inclusion criteria: ambulatory postmenopausal women aged 55 years or older with baseline BMD T-scores from -4.0 to -2.0 at the lumbar spine (LS), total hip (TH), or femoral neck (FN), as measured using dual-energy x-ray absorptiometry (DXA). Exclusion criteria: had received prior bisphosphonate or denosumab treatment or bone-acting drugs, including glucocorticoids. Additional exclusion criteria included hyper/hypocalcemia, vitamin D deficiency (< 20 ng/mL [49.9 nmol/L]), or contraindications to alendronate treatment.
Interventions	Treatment 1: Denosumab 60 mg every 6 months in the 1 <sup>st</sup> year and then crossed over to oral alendronate 70 mg once weekly in the 2 <sup>nd</sup> year (N=) All participants received daily supplementation of calcium (1000 mg) and vitamin D (at least 400 IU).
Outcomes	Osteoporotic and non-vertebral fractures

Langdahl 2017

Methods	STRUCTURE: a phase 3b, randomised, open-label, active-controlled, parallel-group trial. 46 sites (clinical practices, hospitals, and research centres) in North America, Latin America, and Europe
Participants	436 patients were randomized Inclusion criteria: Patients were ambulatory, postmenopausal women (aged ≥55 to ≤90 years at randomisation) who had received oral bisphosphonate therapy at a dose approved for postmenopausal osteoporosis for at least 3 years before screening, and alendronate (70 mg weekly or equivalent) the year immediately before screening. Patients had a history of non-vertebral fracture after age50 years or vertebral fracture; osteoporosis as documented by an areal BMD T score of -2.5 or lower at the total hip, femoral neck, or lumbar spine on dual energy x-ray absorptiometry (DXA) scans; and at least one hip and at least two vertebrae in the L1–L4 region evaluable by DXA Exclusion criteria: Patients were excluded from the study if they had recently used other agents affecting bone metabolism, had a serum 25hydroxyvitamin D concentration of less than 50 nmol/L, or had a history of metabolic or bone disease, or other disease or condition known to affect bone mass.
Interventions	Treatment duration: 12 months Intervention: romosozumab 210 mg, 3 subcutaneous injections of 70 mg each (N=218) Control: teriparatide 20 μg, self-administered, subcutaneously with a pen daily (N=218)
Outcomes	Clinical and non-vertebral fractures

## Lewiecki 2007

Methods	RCT, parallel group 29 centers in the USA
Participants	412 women were randomized; 406 received at least one dose of study drug

	Inclusion criteria: Postmenopausal women up to 80 yr of age were eligible if they had a BMD T-score of $-1.8$ to $-4.0$ at the lumbar spine or $-1.8$ to $-3.5$ at the femoral neck or total hip. An upper limit of $-1.8$ was selected to include both osteopenic and osteoporotic populations.
	Exclusion criteria: Exclusion criteria included the use of bisphosphonates within 12 mo or fluoride within 24 mo; tibolone, PTH or any derivative, systemic glucocorticoids (>5 mg prednisone-equivalent daily for >10 days), inhaled glucocorticoids (>2000 g daily for >10 days), anabolic steroids, or testosterone within 6 mo; and estrogens, selective estrogen receptor modulators, calcitonin, or calcitriol within 3 mo of enrollment. Women with hyper- or hypoparathyroidism, hyper- or hypothyroidism, hypocalcemia, rheumatoid arthritis, Paget's disease of bone, osteomalacia, creatinine clearance 35 ml/min as determined using the Cockcroft-Gault equation, malabsorption syndrome, recent long-bone fracture (within 6 mo), more than one grade 1 vertebral fracture, or an osteoporosis-related fracture within the last 2 yr were excluded. Potential subjects were also excluded if BMD could not be measured accurately by DXA.
Interventions	Intervention 1: open-label alendronate 70 mg, orally once weekly (N=47) Intervention 2: denosumab 6, 14 or 30 mg, subcutaneously every 3 months or denosumab 14, 60,100 or 210 mg, subcutaneously every 6 mo, alternating with placebo (N=319) Control: placebo, subcutaneously every 3 months (N=46)
Outcomes	Clinical and major fractures

## Lindsay 1997

Methods	3 year RCT, parallel group United States
Participants	<ul> <li>34 patients were randomized</li> <li>Inclusion criteria: The principal inclusion criterion was postmenopausal osteoporosis, defined as low bone mass (&gt;2.5 SD below mean young normal values) or atraumatic fractures, or both. Patients were also required to have taken hormone-replacement therapy for more than 1 year and were followed up for 1 year prospectively to ensure that bone mass was stable.</li> <li>Exclusion criteria: Patients were excluded from the study if they had secondary osteoporosis or abnormal thyroid function (patients on thyroxine were included if thyroid-stimulating hormone was normal), renal and hepatic dysfunction, or a history of renal stones within the previous 10 years.</li> </ul>
Interventions	<ul> <li>Participants completed an observation period of 1 year on oestrogens before randomization.</li> <li>Intervention: aminoterminal fragment of human PTH (1-34) plus oestrogens (N=17)</li> <li>Control: oestrogens (N=17)</li> <li>We used conjugated equine oestrogen (0.625 mg/day, Premarin, Wyeth-Ayerst, Philadelphia, PA, USA, n=30) or transdermal oestrogen (50 µg/day, Estraderm, Ciba-Geigg, Summit, NJ, USA, n=4). Patients who had had a hysterectomy (n=6, of whom two were in the PTH group) were not given a progestin. The remainder of the patients were prescribed medroxyprogesterone acetate 5–10 mg a day for at least 10 days per calendar month, or 2.5 mg a day continuously. hPTH (1–34) was given as a lyophilised powder, reconstituted with 1 mL 5% dextrose immediately before self-injection.</li> </ul>
Outcomes	Clinical fractures

## Luckey 2004

Methods	EFFECT (Efficacy of Fosamax versus Evista Comparison Trial) study was a double-blind, randomized, active-controlled, multicenter study 52 sites within the United States
Participants	<ul> <li>456 postmenopausal were enrolled Inclusion criteria:</li> <li>Postmenopausal women (18 months since last menstrual period), women older than 40 years (&gt; 25 years if surgically postmenopausal) with osteoporosis as defined by a low BMD (&gt; 2.0 SD below young normal mean bone mass for either PA lumbar spine (L1 to L4) or total hip). This corresponded to an absolute BMD of 50.835 g/cm2 at the spine and s0.705 g/cm2 at the total hip (Hologic) and ≤0.947 g/cm2 at the spine and s0.747 g/cm2 at the total hip (Lunar). This operational definition of osteoporosis is consistent with the U.S. Food and Drug Administration-approved product labeling of ALN and conforms to the current osteoporosis treatment guidelines set forth by the National Osteoporosis Foundation.2,12 Participants were required to be in good general health, with spinal anatomy suitable for DXA of the lumbar spine.</li> <li>Exclusion criteria: Women were excluded from the study if they had a history of an illness or were found to have an abnormality during the prestudy, clinical, or laboratory evaluation that, in the opinion of the investigator, might compromise the person's safety or the evaluation of the study results. Specifically, women with any history of breast or uterine cancer, active or past history of venous thromboembolic events, including deep vein thrombosis, pulmonary embolism, or retinal vein thrombosis, were excluded from the study. Consistent with the respective product labels, women with a history of significant hepatic dysfunction (ALT ≥2 times the upper limit of normal) or women with abnormalities of the esophagus that delay esophageal emptying, such as esophageal stricture or achalasia, were also excluded. Hypocalcemia or metabolic bone diseases other than postmenopausal osteoporosis were also a reason for exclusion. Women were excluded if they had taken estrogen, estrogen analogues, selective estrogen receptor modulators (SERMS), anabolic steroids, bisphosphonates, or parathyroid hormone within 1 year of study entry. Exceptions</li></ul>
Interventions	<ul> <li>Women were randomized to one of the two treatment groups:</li> <li>1) ALN70 mgOW(taken fasting with a full glass of water upon arising for the day, and while remaining in an upright position for 30 minutes before the first food or beverage of the day) and daily RLX-matching placebo, dosed as RLX below; or</li> <li>2) 2) RLX 60 mg daily (dosed at any time, without regard to food, as long as the dosing occurs at least 30 minutes after taking the OW dose) and ALN-matching placebo, dosed as ALN above.</li> <li>Based on the investigators' clinical assessment of individual participants' dietary calcium and vitamin D intake at baseline, women were instructed to take one or two</li> </ul>

	caplets of Os-Cal 500 + D daily (calcium 500 mg, vitamin D 200 IU) with the noon and/or evening meal.
Outcomes	Clinical fractures (all non-vertebral)
Lufkin 1998	
Methods	RCT, parallel group United States - All of them were studied at the Mayo Clinic, Rochester, MN, or the Mayo Clinic, Scottsdale, AZ, including the women recruited at the Gundersen Clinic in La Crosse, WI, who were studied at the Mayo Clinic, Rochester.
Participants	143 women were randomized Inclusion criteria: Subjects were eligible if they were in good health except for osteoporosis, free of any serious acute or chronic medical condition that might affect bone or calcium metabolism, fully ambulatory, between the ages of 45 and 75 years, and postmenopausal (no menses for 5 years or levels of serum estradiol <73 pmol/land serum follicle-stimulating hormone [FSH] >30 IU/I) The criteria for the diagnosis of osteoporosis were a bone mineral density (BMD) value for either the lumbar spine or proximal femur of ≤10th percentile for normal premenopausal females and one or more non-traumatic vertebral fractures, defined as a decrease in vertical height of ≥15% compared with adjacent vertebrae. (Two women were inadvertently entered whose BMD values were slightly above the entry criteria.) Calcium supplements of ≤500 mg/day or vitamin D ≤800 IU/day were allowed. Patients with previous estrogen replacement therapy (ERT) or calcitonin therapy were accepted after a 6-month wash-out interval before enrollment, and, for larger dosages of calcium supplements or vitamin D supplements, after a 3-month washout interval. Exclusion criteria: Specific exclusion criteria included patients with a history of deep venous thrombosis, thromboembolic disorders, or cerebral vascular accident, also patients with a history of cancer within the previous 5 years, except for superficial skin cancer. Patients were ineligible if they had been previously treated with sodium fluoride or bisphosphonates.
Interventions	Treatment duration: 12 months Intervention 1: raloxifene HCL 60 mg/day (N=48) Intervention 2: raloxifene HCL 120 mg/day (N=47) Control: placebo, daily (N=48)
	Vertebral, non-vertebral and hip fractures

### Malouf-Sierra 2017

Methods	Multinational, multicenter, prospective, randomized, active-controlled study Conducted from April 2009 to August 2015 across 17 countries in North America, Mexico, and Europe Public clinical trial registration: <u>http://clinicaltrials.gov/show/NCT00887354</u>
	Over 2400 patients were screened; 389 were enrolled. N (women) = missing
Participants	Inclusion criteria: The study included men and postmenopausal women with low bone mass who had sustained a recent unilateral pertrochanteric fracture (Arbeitsgemeinschaft fur Osteosynthesefragen [AO]/ Orthopaedic Trauma Association [OTA] types 31-A1 and 31-A2) and were treated with osteosynthesis with a sliding

	compression hip screw or a trochanteric intramedullary nail. Low bone mass was defined by a BMD T-score $\leq$ -2.0 SDs at the total hip, femoral neck, or lumbar spine.
Interventions	Eligible patients were randomly assigned, within 2 weeks of osteosynthesis, in a 1:1 ratio to:
	Intervention 1: teriparatide 20mg subcutaneous injection once daily plus oral placebo once weekly for 26 weeks (n= missing)
	Intervention 2: placebo subcutaneous injection once daily plus oral risedronate 35 mg once weekly for 26 weeks (n= missing)
Outcomes	Clinical and hip fractures

### Masud 2009

Methods	The Hip Intervention Program (HIP): 3-year, double-blind, placebo-controlled, randomized study Conducted between November 1993 and April 1998 at 183 study centers in Europe, North America, New Zealand, and Australia.
	analysis focused on a subgroup of the intention-to-treat (ITT) population from the HIP study
Participants	9331 women enrolled in the original study, 6876 had available and evaluable vertebral fracture status of which 4702 had low BMD.
	Eligible for this analysis: A total of 1656 women had low BMD and at least one prevalent vertebral fracture
	Inclusion criteria: women aged 70 to 100 years with National Health and Nutrition Examination Survey (NHANES) III defined baseline femoral neck T-score of $\leq -2.5$ and at least one prior vertebral fracture consistent with the World Health Organization /International Osteoporosis Foundation criteria for established postmenopausal osteoporosis.
Interventions	Intervention: daily treatment with 2.5 mg or 5.0 mg risedronate (n=1090) Control: identical-appearing placebo (n=566)
Outcomes	Hip fracture

Methods	RCT, parallel group; mean follow-up of 2.3 years 183 study centers in North America, Europe, New Zealand, and Australia
Participants	N=9331 Inclusion criteria: One group consisted of women 70 to 79 years old who had osteoporosis, indicated by either a bone mineral density at the femoral neck (T score) that was more than 4 SD below the mean peak value in young adults (-4) or a femoral- neck T score lower than j3 plus at least one risk factor for hip fracture. These risk factors (hereafter referred to as clinical risk factors) included difficulty standing from a sitting position, a poor tandem gait, a fall-related injury during the previous year, a psychomotor score of 5 or less on the Clifton Modified Gibson Spiral Maze test (a test of hand–eye coordination, with scores ranging from 1 to 12, where scores of 5 or less are considered to indicate an increased risk of falling),16 current smoking or smoking during the previous five years, a maternal history of hip fracture, a previous hip fracture, and a hip-axis length of 11.1 cm or greater. The other group consisted of women 80 years of age or older who had at least one nonskeletal risk factor for hip

	fracture, a femoral neck T score lower than -4, or a femoral-neck T score lower than -3 plus a hip-axis length of 11.1 cm or greater. Exclusion criteria: The exclusion criteria were any major medical illness, a recent history of cancer, another metabolic bone disease within the previous year, important abnormalities in the results of routine laboratory tests, recent use of drugs known to affect bone, allergy to any bisphosphonate, a history of bilateral hip fractures, and any physical or mental condition that would preclude participation in a clinical trial. There were no specific criteria for exclusion on the basis of previous or ongoing upper gastrointestinal tract disorders or concomitant use of non-steroidal anti-inflammatory drugs, aspirin, proton-pump inhibitors, or antacids.
Interventions	Treatment duration: a mean of 2.0 years Intervention: risedronate 2.5 mg or 5.0 mg, daily (N=6197) Control: placebo, daily (N=3134)
Outcomes	Hip fractures

Methods	RCT, parallel group; 2-month screening phase and an 18-month treatment phase 19 clinical sites globally
Participants	<ul> <li>N=203</li> <li>Inclusion criteria: Postmenopausal women with osteoporosis, 45 to 84 years of age. Subjects were ambulatory, 5 years or more past menopause, had a BMD T score between -2.5 and -4.0 at the lumbar spine or femoral neck, and had normal or clinically insignificant abnormal laboratory values, including serum calcium, PTH 1-84, 25-hydroxyvitamin D, and alkaline phosphatase.</li> <li>Exclusion criteria: Women were excluded if they had prior treatment with PTH or a PTH analogue; treatment with bisphosphonates within 12 months, anabolic corticosteroids or calcitriol or vitamin D analogues or agonists within 6 months, estrogens or selective estrogen receptor modulators within 3 months, or calcitonin within 2 months; therapeutic doses of fluoride; systemic corticosteroid use within 1 month or for more than 30 days in the prior year; use of anticoagulants within 1 month; history of diseases other than postmenopausal osteoporosis that affect bone metabolism; malignant neoplasms within 5 years; carcinoma in situ of the uterine cervix within 1 year; nephrolithiasis or urolithiasis within 2 years; abnormal uncorrected thyroid function; liver disease or clinical jaundice; impaired renal function; alcohol or other drug abuse; or poor medical or psychiatric risk for treatment. Patients with an increased risk of osteosarcoma (i.e., patients with Paget disease of bone, previous skeletal exposure to external beam radiotherapy, or previous malignant neoplasm involving the skeleton) were also excluded.</li> </ul>
Interventions	Intervention 1: alendronate 10 mg/day, orally + injectable placebo (N=101) Intervention 2: oral placebo + teriparatide 20 μg (N=102)
Outcomes	Clinical fractures

Participants	412 subjects were enrolled; 85% were white
Methods	Phase 2 RCT, parallel group 29 centers in the USA

	369 (90%) completed 12 months of treatment
	Inclusion criteria: Postmenopausal women up to 80 years of age were eligible if they had a bone mineral density T score of $-1.8$ to $-4.0$ at the lumbar spine or $-1.8$ to $-3.5$ at either the femoral neck or total hip. An upper limit of $-1.8$ was selected to include subjects with both osteopenia and osteoporosis.
	Exclusion criteria: Exclusion criteria included the use of bisphosphonates within the previous 12 months or fluoride within the previous 24 months; tibolone, parathyroid hormone or any derivative, systemic glucocorticoids (more than 5 mg of prednisone equivalent daily for more than 10 days), inhaled glucocorticoids (more than 2000 µg daily for more than 10 days), anabolic steroids or testosterone within 6 months; and estrogens, selective estrogen receptor modulators, calcitonin, or calcitriol within 3 months before enrollment. Exclusion criteria included hyperparathyroidism or hypoparathyroidism, hyperthyroidism or hypothyroidism, hypocalcemia, rheumatoid arthritis, Paget's disease of bone, osteomalacia, a creatinine clearance of less than 35 ml per minute (as estimated by the Cockroft–Gault equation),11 malabsorption syndrome, a recent long-bone fracture (within the previous six months), more than one grade 1 vertebral fracture, an osteoporosis-related fracture within the previous two years, or a case in which bone mineral density could not be accurately measured.
Interventions	Intervention 1: denosumab, subcutaneously every three months (at a dose of 6, 14, or 30 mg) and subcutaneously every six months (at a dose of 14, 60, 100, or 210 mg) (N=319) Intervention 2: open-label alendronate 70 mg, orally once a week (N=47) Control: placebo (N=46)
Outcomes	Vertebral and non-vertebral fractures

Methods	1-year RCT, parallel group 10 centers in the United States
Participants	N=160 Inclusion criteria: postmenopausal women aged 45 – 60 years with baseline mean lumbar spine (LS) BMD T -score between – 1.0 and – 2.5 (L2 – L4) and baseline T -score N – 2.5 in 3 regions of the proximal femur: the total hip (TH), trochanter (TR) and femoral neck (FN). Exclusion criteria: Women with prevalent vertebral fractures (as assessed by lateral X- ray of T4 – L4) or previous low-trauma osteoporotic fractures were excluded, as were patients receiving systemic hormones (including estrogens, progestins, selective estrogen receptor modulators [SERMs], anabolic steroids, active vitamin D analogs/metabolites, and calcitonin). Additional major exclusions included: severe renal failure (defined as a calculated glomerular filtration rate [GFR] b 30 mL/min), malignancy, diseases that impact bone metabolism, treatment with bisphosphonates within the previous 2 years, and history of major upper gastrointestinal disease.
Interventions	Intervention: 150 mg monthly oral ibandronete (N=77) Control: monthly oral placebo (N=83)
Outcomes	Clinical fractures

Methods	Phase 2 RCT, parallel group 28 study centers in Argentina, Austria, Belgium, Canada, Denmark, Spain, and the United States
Participants	419 participants were randomized; 383 (91%) completed the 12 month visit; 86% were white Inclusion criteria: Ambulatory postmenopausal women, 55 to 85 years of age, were eligible if they had low bone mineral density (a T score of -2.0 or less at the lumbar spine, total hip, or femoral neck and −3.5 or more at each of the three sites). Exclusion criteria: A history of vertebral fracture or a fragility fracture of the wrist, humerus, hip, or pelvis after 50 years of age; a history of metabolic bone disease; a serum level of 25-hydroxyvitamin D of less than 20 ng per milliliter; untreated hyper thyroidism or hypothyroidism; current hyperparathyroidism or hypoparathyroidism; an elevated aminotransferase level; substantially impaired renal function (estimated creatinine clearance, ≤30 ml per minute, as assessed by means of the Modification of Diet in Renal Disease equation 14); current hypercalcemia or hypocalcemia; cancer; a positive test for the human immunodeficiency virus, hepatitis C virus, or hepatitis B surface antigen; and a history of spinal stenosis, facial-nerve paralysis, or solid-organ or one marrow transplantation. In addition, the use of any of the following agents affecting bone metabolism was an exclusion criterion: intravenous bisphosphonate or denosumab at any time; fluoride (for treatment of osteoporosis) within the previous 12 months; calcitonin, selective estrogen-receptor modulator, systemic oral or transdermal estrogen, or tibolone within the previous 3 months; or systemic oral or transdermal estrogen, or tibolone within the previous 3 months; or systemic oral or previous 3 months.
Interventions	Intervention 1: alendronate 70 mg, weekly (N=51) Intervention 2: teriparatide 20 μg, daily (N=55) Intervention 3: romosozumab 140 mg or 210 mg every 3 months or 70 mg, 140 mg or 210 mg monthly (N=261) Control: placebo, monthly or every 3 months (N=52)
Outcomes	Non-vertebral fractures

Methods	Phase 2, international, multicenter, randomized, placebo-controlled, dose-finding, parallel-group study. The study was registered as a clinical trial with registration identification ClinicalTrials.gov NCT00896532.
Participants	Inclusion criteria: Postmenopausal women aged 55 to 85 years with a low BMD (T- score of $\leq -2.0$ and $\geq -3.5$ at the lumbar spine, total hip, or femoral neck). Exclusion criteria: Key exclusion criteria were a history of metabolic bone disease; a history of vertebral fracture or a fragility fracture of the wrist, humerus, hip, or pelvis at > 50 years of age; a serum level of 25-hydroxyvitamin D of less than 20 ng/mL; untreated hypothyroidism or hyperthyroidism; current hypoparathyroidism or hyperparathyroidism; current hypocalcemia or hypercalcemia; substantially impaired renal function (i.e., estimated creatinine clearance $\leq$ 30 mL/min as assessed by the Modification of Diet in Renal Disease equation [1]); an elevated aminotransferase level; a positive test for hepatitis C virus, hepatitis B surface antigen, or the human

	immunodeficiency virus; cancer; and a history of spinal stenosis, facial-nerve paralysis, or solid-organ or bone marrow transplantation. Additionally, the use of any of the following agents affecting bone metabolism led to exclusion from the study: intravenous denosumab or bisphosphonate at any time; fluoride (for treatment of osteoporosis) within the previous 24 months; oral bisphosphonate, parathyroid hormone, or strontium within the previous 12 months; selective estrogen-receptor modulator, systemic oral or transdermal estrogen, tibolone, or calcitonin, within the previous 3 months; or systemic glucocorticoid (≥ 5 mg of prednisone equivalent per day for > 10 days) within the previous 3 months.
Interventions	For study period from baseline to 48 months: Subjects who received various romosozumab doses or placebo from months 0–24 were rerandomized to denosumab (60 mg SC Q6M) or placebo for 12 months, followed by open-label romosozumab (210 mg QM) for 12 months.
	The present paper presents data for the study period from 48 to 72 months - Zoledronate Follow-on period: At month 48, subjects who had received active treatment for 48 months were assigned to no further active treatment (N=51) and all other subjects were assigned to zoledronate 5 mg IV (N=90).
Outcomes	Clinical vertebral fractures, adjudicated atypical femoral fractures and fragility fractures.

Methods	International, multicenter, randomized, placebo-controlled, parallel-group study and its extensions (NCT00896532; https://www.clinicaltrials. gov/ct2/show/NCT00896532)
Participants	Inclusion criteria: postmenopausal women 55 to 85 years old with low bone mass (T- score of ≤ 2.0 and ≥ 3.5 at the lumbar spine, total hip, or femoral neck) Exclusion criteria: not reported in this paper.
Interventions	In this analysis, we report the results from a subset of women who were randomized to receive placebo for 24 months, re-randomized to receive denosumab or placebo for 12 months, and then received romosozumab for 12 months. This provides two treatment groups: one that received romosozumab after 3 years of placebo (Group 1; n = 12) and the second group that received placebo for 2 years, then denosumab for 12 months followed by 12 months of treatment with romosozumab (Group 2; n = 16) (Figure 1B). Only data from the 28 subjects who entered the month 36 to month 48 romosozumab treatment period are included in the analyses.
Outcomes	Atypical femoral fractures

### Miller 2008

Methods	RCT, parallel group 101 sites in Canada, Europe and the United States
Participants	1583 women were randomized; 470 (29.7%) discontinued treatment Inclusion criteria: Enrolled subjects were generally healthy women 45 yr of age who were at least 1 yr postmenopausal (i.e., completed their last natural menstrual cycle or underwent bilateral oophorectomy, with or without hysterectomy, at least 1 yr before screening). Women were stratified into two strata based on time since menopause: (1)

	women who were 1–5 yr. postmenopause and (2) those who were >5 yr. postmenopause. Women who were postmenopausal between 1 and 5 yr had to have at least one of the following risk factors for osteoporosis to be enrolled: lumbar spine or femoral neck BMD T-scores between –1.0 and –2.5 as measured by DXA, a family history of fracture, bilateral oophorectomy, current history of smoking, small-boned and/or thin frame (weight <58 kg), inadequate intake of calcium, and little or no weight-bearing exercise. Women in the latter stratum who previously received hormone replacement therapy but had discontinued treatment for 6 mo or women who were surgically postmenopausal for <5 yr were required to have accompanying serum follicle-stimulating hormone (FSH) levels 40 IU/liter and estradiol levels <73.4 pM (20 pg/ml). Women who were postmenopausal for >5 yr had to have the following inclusion criteria: lumbar spine or femoral neck BMD T-scores between –1.0 and ~2.5 in addition to one of the following risk factors: a family history of fracture, bilateral oophorectomy, menopause occurring at <40 yr of age, current history of smoking, small-boned and/or thin frame (weight < 58 kg), inadequate intake of calcium, and little or no weight-bearing exercise. Exclusion criteria: Women were excluded at screening if they had other forms of bone disease, conditions that could invalidate BMD testing, at least one osteoporotic vertebral fracture shown on thoracolumbar radiographs, history of or active nontraumatic venous thromboembolic event, endometrial hyperplasia based on biopsy or endometrial thickness of >5 m on transvaginal ultrasound, abnormal vaginal bleeding, history of malignancy within the previous 10 yr, abnormal laboratory tests including abnormal liver function tests or elevated fasting total cholesterol or triglyceride levels (310 or 300 mg/dl, respectively), and abnormal physical findings including body mass index (BMI) >32.2 kg/m2 or elevations in blood pressure. Subjects were also ineligible if they received treatment with
Interventions	Intervention 1: bazedoxifene 10 mg (N=321) Intervention 2: bazedoxifene 20 mg (N=322) Intervention 3: bazedoxifene 40 mg (N=319) Intervention 4: raloxifene 60 mg (N=311) Control: placebo (N=310)
Outcomes	Clinical fractures

### Miller 2016b

Methods	12 month RCT, parallel group 37 study centers in Belgium, Denmark, Poland, Spain, Canada, the United States, and Australia
Participants	643 were enrolled in the study; 625 (97.2%) completed 12 month of follow-up. Inclusion criteria: Ambulatory postmenopausal women aged 55 years or older who received oral bisphosphonate therapy for 2 years or longer immediately before screening were eligible if they had a T-scoreof-2.5 or less at the lumbar spine, total hip, or femoral neck, two or more lumbar vertebrae, and one hip evaluable by dual-energy x-ray absorptiometry (DXA) and baseline serum C-telopeptide of type 1 collagen (CTX) of 500 pg/mL or less.

	Exclusion criteria: Subjects were excluded if they had received denosumab or ZOL at any time; fluoride, strontium ranelate, or iv bisphosphonate other than ZOL within the previous 5 years; PTH or PTH derivatives within the year before enrollment; or other bone-active drugs in the 3 months before screening.
Interventions	Intervention: denosumab 60 mg, subcutaneously every 6 months + placebo intravenously on day 1 and denosumab 60 mg, subcutaneously at the month 6 visit (N=320)
	Control: zoledronic acid 5 mg, intravenously + denosumab placebo subcutaneously on day 1 and denosumab placebo subcutaneously at 6 months (N=320)
Outcomes	Non-vertebral fractures

### Mortensen 1998

Methods	RCT, parallel group 3 year study (but was initially a 1 year study) Conducted at two study centers: Indiana University School of Medicine, Indianapolis, Indiana, and the Department of Endocrinology, Aarhus Amtssygehus, Aarhus, Denmark.
Participants	<ul> <li>111 women were enrolled in the study; all Caucasian</li> <li>Inclusion criteria: Women with normal lumbar spine bone mass (within 2 sd of age matched mean bone mass) who were 6–60 months postmenopausal qualified for enrollment. Patients' estradiol levels had to be at least 40 pg/mL and FSH at least 20 U/L, and they had to be ambulatory and active, weigh at least 45 kg and no more than 90 kg, and be within 25% of normal weight and height values as determined by the investigator based on standard weight tables (i.e., 1983 Metropolitan Life Insurance tables). Patients also had to be willing and able to participate in the study and to provide written informed consent.</li> <li>Exclusion criteria: Ineligible patients included those who took any bisphosphonate, thyroid hormone therapy, glucocorticoids (&gt;=5 mg prednisone per day), anabolic agents, calcitonin, vitamin D (&gt;400 IU per day), high-dose calcium (&gt;1,500 mg per day), diuretics, or anticonvulsants for more than 1 month within the previous 6 months, estrogens and/or progestogens for more than 1 month within the past year, or fluoride for more than 1 month ever in the past; had a history of any generalized bone disease, including hyperparathyroidism, Paget's disease of bone, renal osteodystrophy, or any other acquired or congenital bone disease, a documented history of alcohol or drug abuse, or evidence of significant organic or psychiatric disease; any evidence of established osteoporosis, such as an atraumatic vertebral deformity documented by spinal x-ray, or a history of osteoporosis related fracture of the hip or wrist; or who underwent bilateral oophorectomy or had any other type of artificially induced menopause.</li> </ul>
Interventions	Intervention 1: oral risedronate cyclically - "cyclic group" (risedronate daily for the first 2 weeks of every calendar month and placebo daily for the rest of the month) (N=38) Intervention 2: oral risedronate daily, the "daily group" (N=37) Control: placebo, orally (N=36)
Outcomes	Vertebral and non-vertebral fractures

### Muscoso 2004

Methods	RCT, parallel group
Participants	2000 women were enrolled in the study Inclusion criteria: osteoporotic female population submitted to a treatment with anti- resorption drugs
Interventions	Intervention 1: alendronate 10 mg, daily for 24 months (N=1000) Intervention 2: risedronate 5 mg, daily for 24 months (N=100) Control: raloxifene 60 mg, daily (N=100)
Outcomes	Clinical fractures

### Panico 2011

Methods	18 month RCT, parallel group Department of Molecular and Clinical Endocrinology and Oncology, University of Naples Federico II, Naples, Italy
Participants	<ul> <li>81 women were enrolled</li> <li>Inclusion criteria: Inclusion criteria for this study consisted of back pain, postmenopausal osteoporosis (T-score ≤–2.5 at lumbar spine or femoral neck), the presence of 2 osteoporotic vertebral fractures, previous treatment for osteoporosis.</li> <li>Exclusion criteria: The exclusion criteria were: an increased risk of osteosarcoma (i.e., patients with Paget disease bone, previous skeletal exposure to external beam radiotherapy, or previous malignant neoplasm involving the skeleton), hypercalcemia, malignant neoplasms, impaired renal function, liver disease, history of diseases other than postmenopausal osteoporosis that affect bone metabolism, nephrolithiasis, alcohol or drug abuse. Secondary osteoporosis was excluded in order to avoid the interference of the primitive disease with the patient's quality of life.</li> </ul>
Interventions	Intervention: 20 μg s.c. of recombinant human parathyroid hormone (rhPTH 1–34), daily self-administered injections (group A) (N=42) Control: 70 mg per os of alendronate every week (group B) (N=39)
Outcomes	Vertebral fractures

### Pols 1999

Methods	FOSIT study: RCT, parallel group 153 centers in 34 countries (Australia, Canada, South Africa, China and in Europe and Latin America)
Participants	N=1908 Inclusion criteria: Women eligible for study participation had been postmenopausal for at least 3 years, were not older than 85 years, and had BMD of the lumbar spine (L2–4) at least 2 standard deviations (SD) below the mean for mature, premenopausal women – a value that approximately corresponds to the median BMD of 65-year-old women. Lumbar spine BMD, as measured using dual-energy X-ray absorptiometry (DXA), was ≤0.86 g/cm <sup>2</sup> by Hologic QDR densitometry (Hologic, Waltham, MA) or ≤0.98 g/cm <sup>2</sup> by Lunar DPX densitometry (Lunar, Madison, WI). Eligible patients were otherwise in good health and were between 20% below and 50% above ideal body

	weight as defined in the Metropolitan Life Insurance Company Height and Weight Table. Levels of 25- hydroxyvitamin D were determined before study entry.
	Exclusion criteria: Excluded from participation were women with metabolic bone disease other than postmenopausal osteoporosis; disturbed parathyroid or thyroid function; major gastrointestinal disease (for example, peptic ulcer or malabsorption) within the year before enrollment or use of a drug to inhibit gastric acid secretion for >2 weeks within 3 months of study entry; myocardial infarction within the year prior to enrollment; uncontrolled hypertension or untreated angina; significantly impaired renal function (serum creatinine >150 mmol/l); or evidence of significant end organ disease. Also excluded were women who had received a bisphosphonate or fluoride (>8 mg/day) during the previous 6 months; estrogen (except vaginal $\leq$ 3 times/week), ipriflavone or calcitonin during the previous 4 months; or any anabolic steroid, glucocorticoid or progestin for >2 weeks within the previous 6 months. Participants could not be receiving any medications that might alter bone or mineral metabolism, including vitamin A in excess of 10.000 U/day, vitamin D in excess of 1000 U/day, anticonvulsants or phosphate-binding antacids. Finally, at least three vertebrae from L1 to L4 had to be evaluable by DXA to determine BMD in this region.
Interventions	Intervention: alendronate 10 mg, once daily for 12 months (N=958) Control: placebo, once daily for 12 months (N=950)
Outcomes	Non-vertebral and hip fracture

### Recker 2004

Methods	RCT, parallel group
Participants	2862 women were randomized Inclusion criteria: All participants were postmenopausal women (aged 55–76 years, time since menopause >= 5 years) who, at enrolment, had a low BMD T score (-2.0 to - 5.0) in at least one vertebra of the lumbar spine (L1 –L4) and one to four prevalent vertebral fractures. Exclusion criteria: Women were excluded if they had a disease or disorder known to influence bone metabolism (chronic GI or liver disease, malignant disease, chronic alcoholism, primary hyperparathyroidism, Paget's disease of bone, histologically documented osteomalacia, active thyroid disease) or had received a drug known to affect bone metabolism in the previous 6 months (corticosteroids, hormone- replacement therapy, calcitonin, cyclosporin, prior bisphosphonate treatment). Women were also excluded if they had received any investigational drug within 30 days of the first dose of the study drug or fluoride pretreatment within the previous 12 months or for a duration of >2 years. Additional exclusion criteria were renal impairment (serum creatinine >210 Amol/I), contraindications for calcium therapy and/or serum calcium concentrations of ≥ 2.6 or <2.0 mmol/I.
Interventions	Intervention 1: 0.5 mg iv ibandronate injections given once every 3months for 3 years (N=950) Intervention 2: 1 mg iv ibandronate injections given once every 3months for 3 years (N=961) Control: placebo, once every 3 months for 3 years (N=949)
Outcomes	Vertebral and hip fractures

### Recker 2007

Methods	The EVA (Evista Alendronate Comparison) trial: RCT, parallel group
	138 clinical study sites
Participants	<ul> <li>1423 women were randomized</li> <li>Inclusion criteria: postmenopausal women between 50and 80 years of age inclusive, whose last menstrual period occurred at least2 years prior to study entry. The original study protocol[23]planned to treat3000 women with osteoporosis, defined by the WHO criteria, with femoral neck bone mineral density (BMD) at least 2.5 but no more than 4.0 standard deviations below the average bone mass for young women (T-score between-2.5 and-4.0, inclusive), according to the 1995 NHANES III reference database[26], and no prevalent vertebral fractures from the fourth thoracic to the fourth lumbar vertebrae, as determined using semi-quantitative analysis. Lateral thoracic and lumbar spinal radiographs were obtained after a patient's eligibility by femoral neck BMD was confirmed by a central coordinating center (Synarc, San Francisco, CA). Women were required to have baseline thoracic and lumbar radiographs evaluable for vertebral fractures, as determined by the coordinating center and at least two lumbar vertebrae evaluable by dual energy X-ray absorptiometry (DXA), prior to enrollment into the treatment phase.</li> <li>Exclusion criteria: Detailed exclusion criteria were previously published[23]and included a history of the following diseases: those which affect calcium or bone metabolism within 1 year of screening, other than low bone mass or osteoporosis; currently suspected of history of known breast or estrogen-dependent carcinoma; history of vaginal bleeding of unknown cause; venous thromboembolic events (VTE), or risk of developing VTE; esophageal abnormalities; and significant abnormal thyroid, hepatic or renal function. Women were also excluded if they took oral or intravenous bisphosphonates, fluorides, parathyroid hormone (PTH) or PTH analog within 1 year, or any other drugs known to significantly affect bone metabolism within 1 month prior to study entry, including calcitonin, estrogens, progestins, androgens, as well as antagonists or selective receptor modulators of the</li></ul>
Interventions	Treatment duration: 5 years Intervention: alendronate 10 mg/day + raloxifene placebo (N=713) Control: raloxifene 60 mg/day + alendronate placebo (N=699)
-	
Outcomes	Vertebral, non-vertebral and hip fractures

### Recknor 2013

Methods	RCT, parallel group 74 centers in the United States and Europe.
Participants	417 women were randomized; 821 (98.6%) received one or more dose of treatment Inclusion criteria: Postmenopausal women with low bone density who had been treated previously with oral bisphosphonate therapy. Ambulatory, postmenopausal women aged 55years or older were eligible if they had received their first prescription of daily or weekly bisphosphonate therapy 1 month or more before screening but had either discontinued bisphosphonate treatment or remained on treatment but had

	insufficient adherence assessed by a score of less than 6 on the Osteoporosis Specific Morisky Medication Adherence Scale. Women with a bone mineral density (BMD) T- score of -2 or less and -4 or greater at the total hip or lumbar spine determined at the local site and had one or more proximal femur (hip) and two or more vertebrae between L1 and L4 evaluable by dual-energy x-ray absorptiometry were included. Exclusion criteria: Exclusion criteria included the current or prior use of osteoporosis medication, except daily or weekly oral bisphosphonate therapy, raloxifene, calcitonin, and hormone replacement therapy; use of medications affecting bone metabolism 3 or fewer months before screening; current enrollment in or less than 1 month since completion of other investigational drug trials; malignancy within the last 5 years, except fully resected basal or squamous cell carcinoma, cervical, or breast carcinoma in situ; impaired renal function (estimated glomerular filtration rate less than 30 mL/min/1.73 m2); or contraindications for ibandronate therapy. Study participants with screening 25-hydroxy vitamin D level less than 20 ng/mL were ineligible but could undergo vitamin D repletion and be rescreened. There was no exclusion based on fracture history.
Interventions	Treatment duration: 12 months Intervention: 60 mg denosumab subcutaneously every 6 months (N=411) Control: 150 mg oral ibandronate once monthly (N=410)
Outcomes	Clinical and non-vertebral fractures

### Reginster 2003

Methods	RCT, parallel group 6 investigative sites in Austria, Belgium, the Czech Republic, Germany and Slovakia
Participants	<ul> <li>Inclusion criteria: Eligible subjects included women aged up to 72 years who had been postmenopausal for at least 2 years. Participants were selected from patients, referred to osteoporosis centers for potential diagnosis and treatment of osteoporosis, and were required to have a BMD, as measured by dual X-ray absorptiometry at the femoral neck, of 2.0standard deviations (SD) or more below the normal peak bone mass for healthy, premenopausal women (T-score).</li> <li>Exclusion criteria: Subjects were excluded from the study for any of the following reasons: more than two fractured lumbar vertebrae or more than three fractured vertebrae of any kind, bone disorders other than primary osteoporosis, endocrine and malignant diseases, uterine and ovarian abnormalities, clinically severe postmenopausal symptoms that required estrogen therapy, a history of thromboembolic disorders, severe chronic diseases, or treatment with any agent that might influence bone turnover.</li> </ul>
Interventions	Treatment duration: 18 months Intervention: raloxifene HCl 60 mg/day (N=291) Control: placebo, daily (N=290)
Outcomes	Clinical, vertebral, non-vertebral and hip fractures
Reid 2002	
Methods	1 year RCT, parallel group

24 centers in 10 countries

Participants	<ul> <li>351 women withdrew from the study, most commonly for personal reasons (in the case of 15 women) or because of adverse events (14 women).</li> <li>316 women completed the study. All but two women were white.</li> <li>Inclusion criteria: In all the women, menopause had occurred at least five years previously, either naturally or as the result of bilateral oophorectomy. All women had a bone mineral density at the lumbar spine (L1 to L4) that was at least 2.0 SD below the mean value for young adults (a T score lower than -2) and had no more than one vertebral fracture at screening.</li> <li>Exclusion criteria: Major criteria for exclusion included systemic estrogen treatment within the previous three months, evidence of secondary osteoporosis, clinical or laboratory evidence of hepatic or renal disease, disorders of the parathyroid or thyroid glands, a serum 25-hydroxyvitamin D concentration of 15 ng per milliliter (37 nmol per liter) or less, a history of cancer, previous treatment with bisphosphonates or fluoride, and current therapy with any other drug known to affect the skeleton.</li> </ul>
Interventions	Intervention: zoledronic acid by intravenous infusion every three months at different doses: 0.25 mg, 0.5 mg, or 1 mg at three month intervals; in addition, one group received a total annual dose of 4 mg as a single dose, and another received two doses of 2 mg each, six months apart. (N=292) Control: placebo (saline) (N=59)
Outcomes	Vertebral and non-vertebral fractures

### Reid 2004

Methods	Phase 3 RCT, parallel group 38 centers in Europe, North America, Australasia, and South Africa.
Participants	<ul> <li>619 subjects were randomized; 95.6% were white.</li> <li>Inclusion criteria: Women were eligible to participate if they were 40 to 60 years of age, postmenopausal (naturally or surgically), had undergone a hysterectomy no more than 15 years before beginning the study, had serum estradiol levels of 20 pg/mL (&lt;73 pmol/L) and follicle-stimulating hormone levels of 40 mIU/mL or higher, and had a lumbar spine BMD measurement between 2.5 SDs below and 2.0 SDs above the mean value for normal premenopausal women.</li> <li>Exclusion criteria: Women were excluded from the study if they had a history of carcinoma of the breast or estrogen dependent tumors; had cancer within the last 5 years (except excised skin cancers); had taken estrogen (other than vaginal estrogens), progestin, androgen, calcitonin, or systemic corticosteroids within the previous 6 months; had ever taken bisphosphonate or fluoride (except for dental prophylaxis); were taking anti-seizure medications; were taking pharmacologic dosages of vitamin D or lipid-lowering drugs; had a history of thromboembolic disorders or of diabetes mellitus or other endocrine disorders requiring therapy (except thyroid hormone therapy); had abnormal renal function or hepatic function; had serious postmenopausal symptoms; or consumed more than 4 alcoholic drinks per day.</li> </ul>
Interventions	Treatment duration: mean of 2.2 years (60% of subjects were still taking study medication at 3 years) Intervention 1: raloxifene 60mg/d (N=152) Intervention 2: raloxifene 150mg/d (N=157) Control 1: placebo, daily (N=158) Control 2: conjugated equine estrogen 0.625 mg/day (N=152)

Outcomes

Vertebral fractures

### Reid 2018

Methods	RCT, placebo group
	New Zealand
	N=2000
Participants	Inclusion criteria: Eligible participants were ambulatory postmenopausal women 65 years of age or older, with a T score of $-1.0$ to $-2.5$ at either the total hip or the femoral neck on either side; both hips were assessed in all patients. A T score of less than $-2.5$ at one hip site (total hip or femoral neck on either side) did not preclude participation in the trial, as long as another hip site met the criteria, so patients at the interface of osteopenia and osteoporosis were included.
	Exclusion criteria: The presence of spinal osteoporosis was not an exclusion criterion as long as the T score was above –3.0. Other exclusion criteria were an estimated glomerular filtration rate of less than 30 ml per minute per 1.73 m2 of body-surface area, major systemic disease, cancer in the previous 2 years, metabolic bone disease, or regular use of bone-active drugs in the previous year (including bisphosphonates, estrogen, antiestrogens, and prednisone at a dose of 2.5 mg or greater per day or equivalent).
Interventions	Intervention: zoledronate 5 mg, 4 infusions at 18 months intervals for 6 years (N=1000)
	Control: placebo (normal saline), 4 infusions at 18 months intervals for 6 years (N=1000)
Outcomes	Clinical, major osteoporotic, vertebral, non-vertebral and hip fractures

### Reid 2019

Methods	RCT, parallel group 6 years of follow-up
Participants	Inclusion criteria: ambulant postmenopausal women aged > 65 years, with T-score at either the right or left total hip or femoral neck in the range -1.0 to -2.5, who were able to give informed consent.
	Exclusion criteria: lumbar spine T-score < -3.0, eGFR < 30 mL min <sup>-1</sup> , major systemic disease, malignant disease in the last 2 years, metabolic bone disease or regular use of bone-active drugs in the previous year (including oestrogen, anti-oestrogens and systemic glucocorticoids in doses equivalent to prednisone $\geq$ 2.5 mg day <sup>-1</sup> ).
Interventions	Intervention: 4 infusions of Zoledronate 5 mg at 18-months intervals Control: 4 infusions of placebo (normal saline) at 18-months intervals
Outcomes	Major clinical fractures, analysis stratified by age, BMI at baseline, LS T score

### Reid 2020

	Prospective, randomized, placebo-controlled, double-blind trial
Methods	The study was registered at the Australian New Zealand Clinical Trials Registry, numberACTRN12609000593235

Participants	Each participant was followed for 6 years. Inclusion criteria: Participants were ambulant postmenopausal women aged >65 years, with T-score at the total hip or femoral neck in the range –1.0 to –2.5, who were able to give informed consent. Exclusion criteria: lumbar spine T-score <–3.0, estimated glomerular filtration rate (eGFR) <30 mL/min, major systemic dis-ease, malignant disease in the last 2 years, metabolic bone dis-ease, or regular use of bone-active drugs in the previous year.
Interventions	Intervention 1: four infusions of either zoledronate5 mg at 18-month intervals (N=1000) Control: normal saline at 18-month intervals (N=1000)
Outcomes	Fragility fractures

### Roux 2014

Methods	12 month RCT, parallel group
Participants	82 centers in Europe, Australia and Canada 870 participants were randomized; 824 (94.7%) completed the study 97.6% were Caucasian Inclusion criteria: Ambulatory, postmenopausal women aged ≥55years were eligible if they had been previously prescribed alendronate therapy, with first daily or weekly alendronate prescription≥1 month prior to screening, without limitation of alendronate treatment duration. To be eligible to participate in this study, the subject must have either stopped oral alendronate therapy before the screening visit, or was still taking oral alendronate therapy (no washout period) with low adherence, which was assessed by a score of <6 on the Osteoporosis Specific Morisky Medication Adherence Scale (OS-MMAS). Exclusion criteria: Key exclusion criteria included any prior or current treatment with osteoporosis medication other than daily or weekly oral alendronate therapy, hormone replacement therapy, and calcium and vitamin D (use of raloxifene or calcitonin prior to initiation of alendronate therapy was allowed); use of the following medications within3 months of screening: tibolone, anabolic steroids or testosterone, and gluccoorticosteroids (≥5 mg prednisone equivalent per dayforN10 days or a total cumulative dose of≥50 mg); contra indicated or poorly tolerant of alendronate; significantly impaired renal function; previous participation in clinical trials with denosumab within the preceding 12 months regardless of treatment; reported malignancy within the last 5 years, except cervical carcinoma in situ or basal cell carcinoma; and any metabolic bone disease that had the potential to interfere with the interpretation of the findings. Vitamin D deficiency, defined as serum 25 (OH) vitamin D levelsb20ng/mL, was an exclusion criterion: repletion as confirmed by a serum vitamin D level≥20ng/mL was allowed and subjects were able to be re-screened only once
Interventions	Intervention: denosumab 60 mg, subcutaneously every 6 months (N=429) Control: risedronate orally 150 mg once monthly (QM, one 75 mg tablet on each of 2 consecutive days) (N=429)
Outcomes	Clinical fractures

### Saag 2017

Methods	Phase 3 RCT, parallel group, with a duration of 12 months. After that, open-label Multicenter, international
Participants	<ul> <li>4093 patients underwent randomization; 3654 patients (89.3%) completed 12 months of the trial</li> <li>Inclusion criteria: Ambulatory postmenopausal women 55 to 90 years of age who met at least one of the following criteria were eligible: a bone mineral density T score of – 2.5 or less at the total hip or femoral neck and either one or more moderate or severe vertebral fractures or two or more mild vertebral fractures; or a bone mineral density T score of –2.0 or less at the total hip or femoral neck and either two or more moderate or severe worderate or severe vertebral fractures or a fracture of the proximal femur sustained 3 to 24 months before randomization.</li> <li>Exclusion criteria: Women were excluded as described previously5and for an inability to take alendronate oral tablets or contraindications to alendronate, including a glomerular filtration rate below 35 ml per minute per 1.73 m2 of body-surface area</li> </ul>
Interventions	Intervention: monthly subcutaneous romosozumab 210 mg for 12 months of the trial and then weekly oral alendronate 70 mg for open-label period for 12 months (N=2046) Control: weekly oral alendronate 70 mg for 12 months of trial and then for the open- label period for 12 months (N=2047)
Outcomes	Clinical, vertebral, non-vertebral and hip fractures

### Sambrook 2004

Methods	EFFECT (the EFficacy of FOSAMAX versus EVISTA Comparison Trial): a RCT, parallel group 50 clinical trial centers in 16 countries in Europe, South America and Asia-Pacific
Participants	<ul> <li>487 women were randomized</li> <li>Inclusion criteria: patients were post-menopausal (defined as at least 6 months beyond the final menstrual period) with low bone density(defined as a BMD at least 2.0 SD below the young normal mean at either the total hip or lumbar spine using the normal range provided by the densitometry manufacturer). Patients were required to be in good general health, and able to accept either treatment.</li> <li>Exclusion criteria: reasons for exclusion included bilateral hip replacement, history of venous thromboembolism, marked hypertriglyceridaemia in response to oestrogen, oesophageal stricture or achalasia, bone-active therapy (including use of a bisphosphonate, oestrogen or oestrogen analogue, or parathyroid hormone) within 1 year of enrolment, and medical conditions or current medications which could affect bone metabolism. Use of oestrogen or other therapies to treat osteoporosis was not allowed during the course of the study.</li> </ul>
Interventions	Intervention: alendronate 70 mg once weekly + daily placebo identical to raloxifene for 12 months (N=246) Control: raloxifene 60 mg daily + weekly placebo identical to alendronate for 12 months (N=241)
Outcomes	Clinical, vertebral and hip fractures

### Valimaki 2007

Methods	24-month, randomized, double-blind, placebo-controlled, parallel-group, Phase III trial Conducted at 14 study centers across Finland, The Netherlands, Norway, Spain, and Sweden (Clinicaltrials.gov number NCT0035308)
	171 women were enrolled and randomized
	The intended-to-treat population included 170 women
	All women were white.
	Inclusion criteria:
	Healthy, ambulatory, late-postmenopausal ( $\geq 5$ years from menopause) women were enrolled in the study.
	The menopause could be either natural or surgical.
	Natural menopause was defined as 12 months without menses, based on medical history. Women who were
	postmenopausal secondary to surgery were required
	per protocol to have a follicle-stimulating hormone
	level of ≥30 IU/L and an estradiol level of ≤150 pmol/L. Patients were also required to have a baseline LS
	BMD T-score between -2.5 and -1 SD (ie, between
	2.5 and 1 SD below the mean value for young white
	female adults [age, 30–40 years]). When measured with a Hologic densitometer (Hologic Inc., Waltham,
	Massachusetts), this equated to 0.772 g/cm <sup>2</sup> < LS
	BMD < 0.937 g/cm <sup>2</sup> ; using a Lunar densitometer (Lunar Corporation, Madison, Wisconsin), the values
	were 0.882 g/cm <sup>2</sup> < LS BMD < $1.062$ g/cm <sup>2</sup> , <sup>3</sup>
	Other inclusion criteria were the presence of $\geq 1$ other
Deutisiaente	risk factor for osteoporosis <sup>19,20</sup> (eg, premature meno- pause [age <42 years], late menarche [age >15 years],
Participants	maternal history of osteoporosis-related fractures,
	body mass index $\leq 22$ kg/m <sup>2</sup> , or a smoking habit of $\geq 10$ cigarettes/d) or the presence of hip osteopenia
	(proximal femur [Fem] T-score $\leq$ -1 [ie, $\geq$ 1 SD below
	the mean value in healthy young women]). Women
	were required to discontinue hormone replacement therapy (HRT), calcitriol, or calcitonin treatment 12,
	4, and 4 weeks, respectively, prior to enrollment.
	Exclusion criteria:
	Patients were excluded if they had a history of can-
	cer within the 5 years before the study, any condition
	that might interfere with the evaluation of LS BMD (eg, confluent aortic calcifications, severe osteoarthritis, spi-
	nal fusion, or >2 fractured lumbar vertebrae $[L1-L4]$ ),
	or any disease requiring long-term treatment with sys-
	temic corticoids. Patients were also excluded if they had
	received bisphosphonate therapy (any dosage) within
	6 months of starting the study treatment or for >14 days
	within 1 year before the start of the study.
Interventions	Treatment duration: 24 months

	Intervention: risedronate 5 mg (n=114)
	Control: placebo (n=57)
Outcomes	Clinical and non-vertebral fractures

# The ACTIVE (The Abaloparatide Comparator Trial In Vertebral Endpoints) study

Methods	ACTIVE: phase 3, randomized, double-blind, active-comparator, placebo-controlled study
Participants	Included criteria: women with postmenopausal osteoporosis Exclusion criteria: Patients were excluded from the trial if their serum creatinine was >2.0 mg/dL (177 lmol/L), or was 1.5–2.0 mg/dL with an eGFR <37 mL/min.
Interventions	Treatment duration: 18 months Intervention: abaloparatide 80 μg, daily subcutaneous injection Intervention: open label teriparatide (20 mg) Control: placebo, daily subcutaneous injection
Outcomes	Vertebral fractures

### Cosman 2017

Bilezikian 2019

Methods	ACTIVE trial (NCT01343004): RCT, parallel group 28 centers in 10 countries
Participants	Inclusion criteria: Postmenopausal women aged 49 to 86 years were enrolled in the ACTIVE trial if they had radiological evidence of at least 2 mild or at least 1 moderate lumbar or thoracic vertebral fractures or a history of nonvertebral fracture within the preceding 5 years, in addition to a BMD T-score –2.5 at the lumbar spine or hip or –2.0 for those older than 65 years. Women older than 65 years were also enrolled without prior fracture if they had a BMD T-score –3.0. Exclusion criteria: Women were excluded if they had more than 4 mild, moderate, or any severe vertebral fractures (consistent with definitions described by Genant et al16), fewer than 2 evaluable lumbar vertebrae, or if hip BMD was unevaluable. Participants were ineligible if they had evidence of metabolic bone disease or malabsorption or were taking any medications that would interfere with bone metabolism. Women were also excluded if they used bisphosphonates for more than 3 months in the past 5 years or denosumab within the past year. Women with a history of osteosarcoma were also excluded. (See the ACTIVE Trial Protocol in Supplement 1 for full inclusion and exclusion criteria.)
Interventions	Treatment duration: 18 months Intervention: abaloparatide 80 μg, daily subcutaneous injection Control: placebo, daily subcutaneous injection
Outcomes	Non-vertebral fractures

Cosman 2020

Methods	ACTIVE: a randomized, double-blind, placebo- and active-controlled, multicenter, phase 3 study (clinicaltrials.gov identifier NCT01343004) ACTIVExtend: 24-month, open-label extension of ACTIVE (clinicaltrials.gov identifier NCT01657162).
Participants	Inclusion criteria: postmenopausal women between the ages of 49 and 86 years with osteoporosis defined by bone mineral density and prior fracture history. Concomitant medications such as statins, aspirin, or antihypertensives were allowed if the dose was stable at entry. Exclusion criteria: not provided.
Interventions	ACTIVE treatment for 18 months: Intervention 1: daily subcutaneous abaloparatide 80 μg (N=822) Control: matching placebo (N=820) Intervention 2: open-label daily subcutaneous teriparatide 20 μg (N=818) After an approximately 1-month treatment-free period for reconsent, eligible participants who had been randomized to either abaloparatide or placebo in ACTIVE were enrolled in ACTIVExtend and transitioned to open-label alendronate 70 mg once- weekly for 24 months.
Outcomes	New vertebral and non-vertebral factures; major osteoporotic fractures, CVD

### McClung 2018

Methods	The ACTIVE study: a randomized, multinational phase 3 trial Posthoc analysis using data from women enrolled in the ACTIVE Trial that were ≥ 80 years
Participants	94 women (5.7%) out of 1645 women in the treatment groups of the ACTIVE trial were aged 80 years or old. Inclusion criteria: postmenopausal women, aged 49 to 86 years, with osteoporosis as defined by prior radiographic vertebral fracture or recent (within 5 y of enrollment) nonvertebral fracture with a BMD T-score $\le -2.5$ and $> -5.0$ at the lumbar spine or femoral neck if aged 65 years or $\le -2.0$ and $> -5.0$ if aged >65 years. For those aged >65 years, no prior fracture was required if the lumbar spine or femoral neck BMD T-score was $\le -3.0$ and $> -5.0$ .
Interventions	Intervention: daily injections of abaloparatide 80µg for 18 months (N=51) Control: matching placebo for 18 months (N=43)
Outcomes	Vertebral and non-vertebral fractures

### McClung 2018a

Methods	ACTIVE study: multicenter, multinational (South America, Asia, North America and Europe)
Participants	Inclusion: postmenopausal women, ages 49–86 years, with osteoporosis as defined by prior radiographic vertebral fracture or recent (within 5 years of enrollment) non-vertebral fracture with a BMD T-score ≤-2.5 at the lumbar spine or femoral neck if age≤65 years or ≤ -2.0 if age>65 years. For those aged>65 years, no prior fracture was required if the lumbar spine or femoral neck BMD t score was ≤-3.0.

Interventions	This analysis included 1645 women that were randomized 1:1:1 to receive: Intervention: daily injections of abaloparatide-SC 80 $\mu g$ for 18 months
	Control: matching placebo for 18 months
Outcomes	Vertebral and non-vertebral fractures

### Miller 2016a

Methods	ACTIVE: a RCT, parallel group 28 study centers in 10 countries
Participants	2463 women were randomized Inclusion criteria: Postmenopausal women aged 49 to 86 years were eligible if they had bone mineral density (BMD) by dual energy x-ray absorptiometry T-score of less than or equal to -2.5 and greater than -5.0 at the lumbar spine or femoral neck together with radiologic evidence of at least 2 mild vertebral fractures or at least 1 moderate vertebral fracture16or history of a low-trauma fracture of the forearm, humerus, sacrum, pelvis, hip, femur, or tibia within the past 5 years. Women older than 65years who met fracture criteria but had a T score of less than or equal to -2.0 and greater than -5.0 were eligible. Women older than 65 years were eligible without fracture criteria if either BMD T score was less than or equal to -3.0 and greater than -5.0. Eligibility required normal serum values for calcium, intact parathyroid hormone, phosphorus, and alkaline phosphatase and a 25-hydroxyvitamin D level of greater than15 ng/mL (37.5 nmol/L [SI conversion, multiply by 2.496]). Exclusion criteria: Women were excluded if they had more than 4 mild, moderate, or any severe vertebral fractures (consistent with definitions described by Genant et al16), fewer than 2 evaluable lumbar vertebrae, or if hip BMD was unevaluable. Participants were ineligible if they had evidence of metabolic bone disease or malabsorption or were taking any medications that would interfere with bone metabolism. Women were also excluded if they used bisphosphonates for more than 3months in the past 5 years or denosumab within the past year. Women with a history of osteosarcoma were also excluded.
Interventions	Treatment duration: 18 months Intervention 1: daily subcutaneous injections of abaloparatide, 80 μg (N=824) Intervention 2: open-label teriparatide 20 μg (N=818) Control: placebo, daily (N=821)
Outcomes	Clinical, major osteoporotic, vertebral and non-vertebral fractures

### Saag 2020

Methods	The Abaloparatide Comparator Trial in Vertebral Endpoints (ACTIVE) trial: randomized, multicenter study (NCT01343004). Subgroup analysis of women in the ACTIVE trial
Participants	Inclusion criteria in the ACTIVE trial: postmenopausal women aged 49-86 years with osteoporosis, has been previously described.19 Briefly, women with a prior radiographic vertebral fracture or recent (within 5 years) nonvertebral fracture and a BMD T score of $\leq$ -2.5 and $>$ -5.0 (if aged $>$ 65 years) or $\leq$ -2.0 or $>$ -5.0 (if aged $>$ 65

	years) were included in the study. Women >65 years of age with no prior fracture and a lumbar spine or femoral neck BMD T score of $\leq$ -3.0 or >-5.0 were also eligible. Inclusion criteria for this subgroup analysis: women in the ACTIVE study who were <65 years of age and who met modified utilization management criteria (baseline T score at any site of $\leq$ -2.5 and a prevalent vertebral and/or at least 1 prior clinical fracture within 5 years of randomization). The modified utilization management criteria were based on coverage criteria for abaloparatide from a large US health insurance company.
Interventions	Participants were randomly assigned 1:1:1 to receive for 18 months: double blind, daily abaloparatide 80 μg subcutaneously (N=94), matching placebo subcutaneously (N=103), or open-label teriparatide 20 μg subcutaneously (N=99).
	NOTE: In parentheses, it is given the number of women that met inclusion criteria by treatment for this subgroup analysis.
Outcomes	Vertebral fractures, non-vertebral fractures, clinical fractures and major osteoporotic fractures.

### Watts 2019

Methods	The 18-month phase 3 Abaloparatide Comparator Trial in Vertebral Endpoints (ACTIVE): multicenter, multinational, randomized controlled study (clinicaltrials.gov identifier: NCT01343004). Explanatory analysis that used data from the ACTIVE study.
Participants	<b>Inclusion criteria:</b> postmenopausal women, ages 49 to 86 years, with osteoporosis as defined by prior radiographic vertebral fracture or recent (within 5 years of enrollment) nonvertebral fracture with a BMD T-score $\leq -2.5$ at the lumbar spine or femoral neck if age $\leq$ 65 years or $\leq -2.0$ if age $>$ 65 years. For those aged $>$ 65 years, no prior fracture was required if the lumbar spine or femoral neck BMD T-score was $\leq -3.0$ . Other inclusion/exclusion criteria have been previously described (REF: Miller 2016).
Interventions	Participants were randomly assigned 1:1:1 to double blind, daily abaloparatide 80 μg subcutaneously, matching placebo subcutaneously, or open-label teriparatide 20 μg subcutaneously for 18 months. All women received supplements of 500 to 1000 mg/day calcium and 400 to 800 IU vitamin D based on regional standard of care.
Outcomes	Wrist fractures

# The BONE study (oral iBandronate Osteoporosis Vertebral Fracture Trial in North America and Europe, BONE)

Chesnut 2004

Participants	73 centers in North America and Europe 2946 women were enrolled and randomized; 1938 women completed treatment
Methods	BONE trial: 3 year RCT, parallel group

	Inclusion criteria: Eligible patients were 55–80years of age and≥ 5 years postmenopausal, with one to four prevalent vertebral fractures (T4–L4) and a BMD T score of-2.0 to-5.0 in at least one vertebra (L1–L4). Patients with upper GI disorders or taking medication with a potential for GI irritation were not specifically excluded. Exclusion criteria: The main exclusion criteria were a BMD T score of < -5.0 at the lumbar spine; more than two prevalent fractures of the lumbar spine; diseases, disorders, or therapy (within the last 6 months) known to affect bone metabolism; previous treatment with bisphosphonates; fluoride treatment within the last 12 months or for a total duration of > 2 years; renal impairment (serum creatinine >2.4 mg/dl [ > 212 µM]);contraindications to calcium or vitamin D therapy; and hyper- or
Interventions	hypocalcemia. Intervention 1: ibandronate 2.5 mg, oral daily (N=977) Intervention 2: ibandronate 20 mg, oral every other day for 12 doses every 3 months; on the days when no active medication was given, patients received placebo (N=977) Control: placebo, oral daily (N=975)
Outcomes	Vertebral and non-vertebral fractures

### Chesnut 2005

Methods	BONE: a double-blind, placebo-controlled, phase III, fracture-prevention study 73 centers in North America (United States and Canada) and Europe.
Participants	Inclusion criteria: postmenopausal women (aged 55years–80years; time since menopause: at least 5 years) with osteoporosis (one to four prevalent vertebral fractures [T4–L4] and BMD T-score –2 to –5 in at least one vertebra [L1–L4]). Participants with upper gastro intestinal (GI) disorders or receiving concomitant medications with a potential for GI irritation (e.g., nonsteroidal anti-inflammatory drugs [NSAIDs]) were not specifically excluded.
Interventions	3 years of treatment. Intervention 1: ibandronate 2.5 mg, oral daily (N=977) Intervention 2: ibandronate 20 mg, oral every other day for 12 doses every 3 months; on the days when no active medication was given, patients received placebo (N=977) Control: placebo, oral daily (N=975)
Outcomes	Clinical, vertebral and non-vertebral fractures

### Delmas 2004

Methods	The BONE study: a multinational, randomized, double-blind, placebo-controlled, pivotal fracture-prevention study North America and Europe
Participants	ITT population: 2929 2946 patients, aged 55-80 years, ≥5 years postmenopause, with one to four prevalent vertebral fractures (T4-L4), and with a BMD T-score of -2.0 to -5.0 in at least one vertebra (L1-L4) were included.
Interventions	Intervention 1: ibandronate, 2.5 mg, oral daily (N=not stated/unclear) Intervention 2: ibandronate, 20 mg, oral every other day for 12 doses every 3 months. On days without active treatment, the participants in this group received placebo. (N= not stated/unclear)

	Control: placebo (N= not stated/unclear)
Outcomes	Vertebral fractures

### Felsenberg 2005

Methods	Posthoc analysis using data from the BONE study: f a multinational, randomized, double-blind, placebo-controlled, phase III, fracture prevention study North America and Europe.
	The BONE study enrolled 2946 patients aged 55 –80 years, ≥5 years postmenopause, with 1 – 4 prevalent vertebral fractures (T4 –L4), and with a BMD T score of -2.0 to -5.0 in ≥1 vertebra (L1 –L4).
Participants	1964 women were included in this analysis, 982 women in each treatment group (intervention vs control)
	628 women in the placebo group and 648 women in the ibandronate group completed the treatement
Interventions	Treatment duration: 3 years Intervention: oral ibandronate 2.5 mg/day (N=977) Control: placebo, daily (N=975)
Outcomes	Vertebral fractures

# FIT (The Fracture Intervention Trial)

### Bauer 2006

Methods	Posthoc analysis using data from the FIT, a randomized, double-blind clinical trial 11 clinical centers in the United States
Participants	<ul> <li>Included data from both the vertebral fracture arm, which enrolled women with one or more existing vertebral fractures (duration of 3 years), and the clinical fracture arm, which enrolled women without baseline vertebral fracture (duration 4 years).</li> <li>N=6186 - women who completed the trial and had complete baseline and follow-up measurements.</li> <li>Inclusion criteria: postmenopausal women between 55 and 80 years of age with femoral neck BMD (QDR-2000; Hologic, Waltham, MA, USA) 0.68 g/cm<sup>2</sup>, equivalent to T score ≤-1.6 using NHANEs normative data.</li> </ul>
Interventions	Intervention: Alendronate (ALN) 5 mg /day for 2 years and then increased to 10 mg/day at the second annual visit - Intervention 1: osteoporotic subjects (N= 1764) - Intervention 2: non-osteoporotic subjects(N=1341) Control: placebo (PBO), daily - Control 1: osteoporotic subjects (N=1731) - Control 2: non-osteoporotic subjects (N=1348)
Outcomes	Vertebral and non-vertebral fractures

### Black 1996

Methods	FIT: RCT, parallel group
wiethous	11 centers in the USA
Participants	N=2027 Inclusion criteria: A woman must be 55-80 years of age, in good health, postmenopausal for at least 2 years, and have a femoral neck bone mineral density ≤0.68 g/cm <sup>2</sup> . Exclusion criteria: Women with peptic-ulcer disease (a single hospital admission for upper-gastrointestinal bleeding or two or more documented ulcers within the preceding 5 years), dyspepsia requiring daily treatment, abnormal renal function (serum creatinine >144 nmol/L), major medical problems that would be likely to preclude participation for 3 y, severe malabsorption syndrome, uncontrolled hypertension (blood pressure >210 mm Hg systolic or >105 mm Hg diastolic), myocardial infarction during the previous 6 mo, unstable angina, or evidence of disturbed thyroid or parathyroid function. Also excluded women who had taken oestrogen or calcitonin within the preceding 6 mo or biphosphonates or sodium
	fluoride (<1mg daily for 2 weeks or longer) at anytime.
Interventions	Treatment duration: 3 years Intervention: alendronate 5 mg/day in the 1 <sup>st</sup> year and then increased to 10 mg/day at the 24 months clinic visit (N=1022) Control: placebo, daily (N=1005)
Outcomes	Clinical, vertebral, non-vertebral and hip fractures

### Chapurlat 2005

Methods	FIT 11 clinical centers in the USA The FIT had two arms, which in this study were pooled: the vertebral fracture arm (FIT- I) with a duration of 3 years, and the clinical fracture arm (FIT-II) with a duration of 4 years.
Participants	<ul> <li>N=5383 - patients who adhered to treatment by taking at least 70% of pills by pill count and 75% by diary.</li> <li>- FIT-I: included 2,027 women who had prevalent vertebral fractures and low femoral neck BMD (≤ 0.689 g/cm2).</li> <li>- FIT-II: enrolled 4,432 women who had low femoral neck BMD (≤ 0.68 g/cm2) but no vertebral fracture at baseline.</li> </ul>
Interventions	Intervention: alendronate 5 mg /day for 2 years, which was then increased to 10 mg/day Control: placebo
Outcomes	Vertebral fracture

### Cummings 1998

Methods	FIT - RCT, parallel group – had 2 arms: the vertebral fracture arm, which included women who had vertebral fractures, and the clinical fracture arm, which included
	women without vertebral fractures and is the subject of this article.

	11 community based clinical research contars in the United States
	11 community-based clinical research centers in the United States
	N= 4432, 97% were white 4272 women (96%) completed the study; follow-up: average of 4.2 years
	Inclusion criteria: women aged 55 through 80 years who had been postmenopausal for at least 2 years and had femoral neck BMD of 0.68 g/cm2 (QDR2000, Hologic Inc, Waltham, Mass) or less, which corresponded to 1.6 SD or more below the normal young adult mean.
Participants	Exclusion criteria: women who had recent peptic ulcers or ulcers that required hospitalization, dyspepsia requiring daily treatment, significant renal or hepatic dysfunction, medical problems that precluded 3 years of participation, severe malabsorption, blood pressure exceeding 210 mm Hg systolic or 105 mm Hg diastolic, myocardial infarction within 6 months, unstable angina, hypothyroidism, hyperthyroidism, or hyperparathyroidism. We also excluded women who had taken estrogen or calcitonin within the preceding 6 months or bisphosphonates or sodium fluoride (>1 mg/d) at any time. Although women taking estrogen were excluded from entry into the trial, 246 (11.1%) in the placebo group and 204 (9.2%) in the alendronate group took estrogen at some time during the study.
Interventions	Intervention: alendronate sodium 5 mg/day for 2 years, followed by 10 mg/day from the rest of the trial (N=2214) Control: placebo, daily (N=2218)
Outcomes	Clinical, vertebral, non-vertebral and hip fractures

### Donaldson 2012

Methods	FIT: RCT, parallel group The FIT had 2 arms: the vertebral fracture arm, which included women who had vertebral fractures, and the clinical fracture arm, which included women without vertebral fractures. 11 community-based clinical research centers in the United States
Participants	Inclusion criteria: Women 55 to 81 years of age who had been postmenopausal for at least 2 years and had low FN BMD (BMD ≤0.68 g/cm2; T-score ≤ -1.6). Exclusion criteria: The primary exclusion criteria are the presence of major medical conditions or secondary causes of osteoporosis, the presence of significant upper gastrointestinal disease, therapy with drugs that affect bone metabolism or factors that might make full compliance with the protocol unlikely. A complete list of inclusion and exclusion criteria is shown in Table 2.
Interventions	Women who participated in FIT-VF were followed for a median of 3 years. Women who participated in FIT-CF were followed for a median of 4 years. Intervention: alendronate 5 mg/day (N=3236) Control: placebo, daily (N=3223)
Outcomes	Non-vertebral fractures

### Hochberg 2005

Methods	FIT: a RCT, parallel group
	11 centers in the United States

Participants	Inclusion criteria: Study participants were women 55–80 years of age who had been postmenopausal for at least 2 years and had a femoral neck BMD <= 0.68 g/cm2, measured using Hologic densitometer
Interventions	The average duration of treatment and follow-up according to the FIT protocol was 2. years in FIT I and 4.25 years in FIT II. Intervention: alendronate 5mg/day for the first 24 months, followed by 10 mg/day for the rest of the period (N=4408) Control: placebo, daily (N=4343)
Outcomes	Major, vertebral, non-vertebral and hip fractures
Nevitt 1999	
Methods	FIT, a large randomized, placebo-controlled trial of alendronate, had two arms: - the Vertebral Fracture Arm ( average of 2.9 years of follow-up) and - the Clinical Fracture Arm (average of 50 months of follow-up). 11 metropolitan areas in the United States of America using population-based listings
	6082 women (94.2%) were included in this analysis, whom were randomized and had lateral spine radiographs at baseline and at least one additional visit.
Participants	<ul> <li>Inclusion criteria: Women between the ages of 55 and 81 years, that had femoral nect</li> <li>BMD of 0.68 g/cm or less (measured by Hologic Model QDR-2000, Waltham, MA), and had been postmenopausal for at least 2 years. The femoral neck BMD cutoff used corresponds to approximately 1.6 SD below the mean for young white women.</li> <li>Exclusion criteria: Women were excluded if they had active serious peptic ulcer</li> <li>disease during the past year, a recent history of abnormal renal function, uncontrolled hypertension, severe malabsorption, myocardial infarction during the previous 6</li> <li>months, unstable angina, or medical problems that would interfere with participation for the 3–4 year study duration. Women who had used fluoride or bisphosphonates ar any time in the past, or had used estrogen or calcitonin during the previous 6 months, were also excluded.</li> </ul>
Participants	<ul> <li>BMD of 0.68 g/cm or less (measured by Hologic Model QDR-2000, Waltham, MA), and had been postmenopausal for at least 2 years. The femoral neck BMD cutoff used corresponds to approximately 1.6 SD below the mean for young white women.</li> <li>Exclusion criteria: Women were excluded if they had active serious peptic ulcer disease during the past year, a recent history of abnormal renal function, uncontrolled hypertension, severe malabsorption, myocardial infarction during the previous 6 months, unstable angina, or medical problems that would interfere with participation for the 3–4 year study duration. Women who had used fluoride or bisphosphonates a any time in the past, or had used estrogen or calcitonin during the previous 6 months.</li> </ul>

### Quandt 2005

Methods	FIT had 2 arms: FIT I – women with a vertebral fracture at baseline FIT II – women without a vertebral fracture 11 clinical centers in the USA Participants were followed up to 4.5 years (mean 3.8 years).
Participants	N=3737 Inclusion criteria: women from FIT I and FIT II who had a diagnosis consistent with the World Health Organization definition of osteopenia (a femoral neck BMD T score of - 1.6 or less but greater than -2.5.

Interventions	Intervention: alendronate 5mg/day for the first 2 years and by 10 mg/day for the rest of the study (N=1878) Control: placebo (N=1859)
Outcomes	Vertebral fractures
Ryder 2008	
Methods	Posthoc analysis using data from FIT II (the study arm that included women without prevalent vertebral deformity at baseline). 11 clinical sited in the USA
Participants	N=2785 Inclusion criteria: women enrolled in FIT II without vertebral deformity had a femoral neck T-score above –2.5.
Interventions	Intervention: alendronate for up 54 months (5 mg/day for the first 2 years, and then increased to 10 mg/day at the second annual visit) (N=1389) Control: placebo for up 54 months (N=1396)
Outcomes	Non-vertebral fractures

### van de Glind 2016

Methods	FIT, a RCT, parallel group
Participants	N=3658 Inclusion criteria: all patients (n = 3658) with confirmed osteoporosis [either a femoral neck bone mineral density (BMD) T score B22.5 (n = 1631) or at least one morphometric vertebral fracture (n = 2027)].
Interventions	Intervention: alendronate (N=1841) Control: placebo (N=1817)
Outcomes	Clinical fractures

### The FPT (The Fracture Prevention Trial)

# Boonen 2006MethodsFPT, a RCT, parallel group<br/>99 centers in 17 countriesParticipantsN=1085<br/>Inclusion criteria: postmenopausal women aged 42 to 86 were enrolled in the study.<br/>Study protocol required that the patients be ambulatory, at least 5 years<br/>postmenopausal, and free of other major diseases and have had at least one moderate<br/>or two mild atraumatic vertebral fractures.<br/>Exclusion criteria: women with illnesses that affect bone or calcium metabolism,<br/>urolithiasis within the preceding 5 years, impaired hepatic function, a serum creatinine<br/>concentration exceeding 2 mg per deciliter (177 µmol per liter), or alcohol or drug

	abuse, as well as women who had taken drugs that alter bone metabolism within the previous 2 to 24 months (depending on the drug).
Interventions	Treatment duration: median of 19 months Intervention: teriparatide 20 μg, daily self-injection (N=541) Control: placebo, daily self-injection (N=544)
Outcomes	Vertebral and non-vertebral fractures

### Chen 2006

Methods	Posthoc analysis using data from FPT 99 centers in 17 countries
Participants	1637 ambulatory, postmenopausal were included in the FPT In this analysis were included all subjects that had a spine BMD measurement at baseline and 18 months and lateral spine radiographs at baseline and study endpoint. Inclusion criteria: Women were ambulatory, if a period of at least five years had elapsed since menopause, and if they had at least one moderate or two mild atraumatic vertebral fractures on radiographs of the thoracic and lumbar spine, and an ambulatory status.6 For women with fewer than two moderate fractures, an additional criterion for enrollment was a value for bone mineral density of the hip or lumbar spine that was at least 1 SD below the mean value in normal premenopausal white women (age range, 20 to 35 years). Exclusion criteria: Women with illnesses that affect bone or calcium metabolism, urolithiasis within the preceding 5 years, impaired hepatic function, a serum creatinine concentration exceeding 2 mg per deciliter (177 $\mu$ mol per liter), or alcohol or drug abuse, as well as women who had taken drugs that alter bone metabolism within the previous 2 to 24 months (depending on the drug).
Interventions	Treatment duration: 24 months Intervention: teriparatide 20μg or 40μg per day, self-administered subcutaneous injections (N=860) Control: placebo, daily self-administered subcutaneous injections (N= 439)
Outcomes	Vertebral fractures, stratified analysis on LS BMD

### Delmas 2006

Methods	FPT
	99 centers in 17 countries
	1637 ambulatory, postmenopausal women ranging in age from 42 to 86 years were included in FPT
Participants	Two subsets of participants, partially overlapping, were included in this analysis: - Four BTM subset: 520 women had four bone turnover markers (BTM) assessed (Serum concentrations of two bone formation markers - bone-specific alkaline phosphatase [BSAP], and the carboxy-terminal extension peptide of procollagen type I [PICP]) and urinary concentrations of two bone resorption markers (free deoxypyridinoline [DPD], and N-terminal telopeptide [NTX]), and

	<ul> <li>The PINP subset: 771 participants who had serum collected at baseline, for which the concentration of amino-terminal extension peptide of procollagen type I [PINP] could be assessed.</li> </ul>
	Inclusion criteria: ambulatory women, if a period of at least five years had elapsed since menopause, and if they had at least one moderate or two mild atraumatic vertebral fractures on radiographs of the thoracic and lumbar spine, and an ambulatory status. For women with fewer than two moderate fractures, an additional criterion for enrollment was a value for bone mineral density of the hip or lumbar spine that was at least 1 SD below the mean value in normal premenopausal white women (age range, 20 to 35 years).
	Exclusion criteria: women with illnesses that affect bone or calcium metabolism, urolithiasis within the preceding 5 years, impaired hepatic function, a serum creatinine concentration exceeding 2 mg per deciliter (177 $\mu$ mol per liter), or alcohol or drug abuse, as well as women who had taken drugs that alter bone metabolism within the previous 2 to 24 months (depending on the drug).
Interventions	Median duration of exposure to teriparatide was 19 months. Intervention: teriparatide 20 mcg or 40 mcg per day, daily self-administered subcutaneous injections (Four BTM subset: N=345; the PINP subset N= 511) Control: placebo, daily self-administered subcutaneous injections (Four BTM subset: N=175; the PINP subset N=260)
Outcomes	Major osteoporotic fractures, vertebral and non-vertebral fractures

### Gallagher 2005

Methods	Analysis with data from women that participated in the FPT study
Participants	N=931 - postmenopausal women with baseline radiographs were included in this analysis; of those 91 did not have a vertebral fracture. Inclusion criteria: ambulatory women at least 5 yr past menopause who had at least one moderate or two mild atraumatic vertebral fractures. For women who had fewer than two moderate vertebral fractures, an additional inclusion criterion included bone mineral density (BMD) of the lumbar spine or proximal femur at least 1 SD below the mean value in healthy young (20 –35 yr old) white women. Exclusion criteria: Women with diseases related to bone or calcium metabolism, urolithiasis within the preceding 2 yr, alcohol or drug abuse, impaired hepatic function, or a serum creatinine concentration of 177 $\mu$ M or higher were excluded from the study. Women who had taken drugs affecting bone metabolism within the past 2–24 months, depending on the drug, were also excluded.
Interventions	Median of 19 months of treatment Intervention: teriparatide 20 μg, daily self-administered subcutaneous injections (N=467) Control: placebo, daily self-administered subcutaneous injections (N=464)
Outcomes	Vertebral and non-vertebral fractures

### Harvey 2015

Methods	Analysis with data from the FPT study, a pivotal global, phase 3, multicentre, double-
wiethous	blind, calcium- and vitamin D-controlled, randomized study of teriparatide

Participants	Inclusion criteria: ambulatory postmenopausal women Exclusion criteria:
Interventions	Intervention: teriparatide 20 μg/day or 40 μg/ day, for a mean duration of 18±6 and 17±6 months, respectively (N=1093) Control: placebo daily, for a mean duration of 18±5 months (N=544)
Outcomes	Major osteoporotic fractures, vertebral and non-vertebral fractures

### Krege 2012

Methods	Posthoc analysis using data from the FPT study, which was a randomized, double- blinded, placebo-controlled trial Median follow-up of 21 months
Participants	Inclusion criteria: postmenopausal women with osteoporosis and vertebral fractures
Interventions	Intervention: daily subcutaneous self-injections of teriparatide 20 $\mu g$ for a median of 19 months (N=541)
	Control: daily subcutaneous self-injections of placebo for a median of 19 months (N=544)
Outcomes	Non-vertebral fractures

### Lindsay 2009

Methods	Posthoc analysis of data from the FPT study
Participants	Inclusion criteria: Women were required to be at least 5 years postmenopausal with at least one moderate or two mild atraumatic vertebral fractures. Women with fewer than two moderate vertebral fractures were required to have lumbar spine or hip T score of -1 or below.
	Exclusion criteria: diagnosis with any disease known to affect bone or calcium metabolism, urolithiasis within 2 years, serum creatinine level greater than 2 mg/dl, alcohol or drug abuse, or medication use known to alter bone metabolism within the previous 2 to 24 months depending on the drug.
Interventions	Intervention 1: once-daily subcutaneous injections of teriparatide 20 μg (N=541) Intervention 2: once-daily subcutaneous injections of teriparatide 40 μg (N=552) Control: once-daily subcutaneous injections of placebo (N=544)
Outcomes	Vertebral and non-vertebral fractures

### Marcus 2003

Methods	FPT study
Participants	1637 ambulatory postmenopausal women were enrolled in FPT study Inclusion criteria: postmenopausal women at least 5 years beyond menopause and had a minimum of either one moderate or two mild atraumatic vertebral fractures and a minimum of seven evaluable nonfractured vertebrae on baseline spinal radiographs.
	Women with fewer than two moderate fractures were also included if their hip or

	vertebral BMD values were less than 1 SD below the mean value for normal premenopausal white women (i.e., T score < $-1.0$ ). Exclusion criteria: Women with diseases related to bone or calcium metabolism, urolithiasis within the preceding 5 years, alcohol or drug abuse, impaired hepatic function, a serum creatinine concentration $\ge 177 \ \mu$ M, or had taken drugs affecting bone metabolism within the past 2–24 months.
	Treatment duration: Rather than achieving the planned 36 months of teriparatide administration for all subjects, the median duration of drug exposure was 19 months with no subject exposed to drug for more than 25 months.
Interventions	Intervention 1: Teriparatide 20 μg, daily, self-administered subcutaneous injections (N=541)
	Intervention 2: Teriparatide 40 $\mu$ g, daily, self-administered subcutaneous injections (N=552)
	Control: placebo, daily, self-administered subcutaneous injections (N=544)
Outcomes	Vertebral fractures

### Neer 2001

Methods	FPT study: RCT, parallel group 99 centers in 17 countries (United States, Australia, New Zealand, Canada, South America and in Europe)
Participants	1637 women were randomized Inclusion criteria: Women were eligible for enrollment if they were ambulatory, if a period of at least five years had elapsed since menopause, and if they had at least one moderate or two mild atraumatic vertebral fractures on radiographs of the thoracic and lumbar spine, and an ambulatory status.6 For women with fewer than two moderate fractures, an additional criterion for enrollment was a value for bone mineral density of the hip or lumbar spine that was at least 1 SD below the mean value in normal pre-menopausal white women (age range, 20 to 35 years). Exclusion criteria: We excluded women with illnesses that affect bone or calcium metabolism, urolithiasis within the preceding 5 years, impaired hepatic function, a serum creatinine concentration exceeding 2 mg per deciliter (177μmol per liter), or alcohol or drug abuse, as well as women who had taken drugs that alter bone metabolism within the previous 2 to24 months (depending on the drug).
Interventions	Intervention 1: self-administered injections of parathyroid hormone (1-34) 20 μg/day for a mean (±SD) duration of treatment of 18±6 months (N=541) Intervention 2: self-administered injections of parathyroid hormone (1-34) 40 μg/day for a mean (±SD) duration of treatment of 17±6 months (N=552) Control: self-administered injections of placebo, daily for a mean (±SD) duration of treatment of 18±5 months (N=544)
Outcomes	Major, vertebral, non-vertebral and hip fractures

### Prevrhal 2009

Mathada	FPT study
Methods	Median observation of 21 months

Participants	Inclusion criteria: Postmenopausal women with osteoporosis, who were included in the FPT study, specifically included in the placebo and teriparatide 20g/day group and that had a baseline and endpoint spine radiograph.
Interventions	Treatment duration: median study drug exposure of 19 months Intervention: Teriparatide 20 μg, daily, self-injection (N=444) Control: placebo, daily, self-injection (N=448)
Outcomes	Vertebral fractures

### Watts 2009

Methods	FPT study – RCT, parallel group
Participants	Inclusion criteria: Women were eligible for enrollment if they were ambulatory, if a period of at least five years had elapsed since menopause, and if they had at least one moderate or two mild atraumatic vertebral fractures on radiographs of the thoracic and lumbar spine, and an ambulatory status.6 For women with fewer than two moderate fractures, an additional criterion for enrollment was a value for bone mineral density of the hip or lumbar spine that was at least 1 SD below the mean value in normal pre-menopausal white women (age range, 20 to 35 years). Exclusion criteria: We excluded women with illnesses that affect bone or calcium metabolism, urolithiasis within the preceding 5 years, impaired hepatic function, a serum creatinine concentration exceeding 2 mg per deciliter (177µmol per liter), or alcohol or drug abuse, as well as women who had taken drugs that alter bone metabolism within the previous 2 to24 months (depending on the drug).
Interventions	Treatment duration: median duration of exposure of 19 mo Intervention 1: 20 μg of recombinant human parathyroid hormone (1-34) in a regimen of daily, self-administered injection (N=541) Intervention 2: 40 μg of recombinant human parathyroid hormone (1-34) in a regimen of daily, self-administered injection (N=552) Control: placebo (N=544)
Outcomes	Vertebral fractures

### The Chinese osteoporosis study and the FPT

Xie 2019	
Methods	Post-hoc analysis using data from 2 studies: - Chinese osteoporosis study (NCT00414973): Chinese, open-labeled, multicenter, active comparator, randomized phase III study, carried out at 10 study centers
	<ul> <li>- FPT (NCT00670501): Global, phase III, multicenter, double-blind, placebo-controlled, randomized study, conducted in 99 centers in 17 countries</li> </ul>
Participants	Inclusion criteria: Only those who met the selection criteria for both the FPT and the Chinese study were considered: patients who were female with osteoporosis at high risk of fracture, aged ≥55 years, and had no history of rheumatoid arthritis or use of corticosteroids.
	Inclusion criteria specific of each study:

	<ul> <li>Chinese osteoporosis study: Ambulatory men (aged 40–85 years) or women (aged 55–85 years and at least 3 years postmenopause). Established osteoporosis based on experiencing a fragility fracture prior to enrollment or T-score BMD &lt;2.5 at LS or hip</li> <li>FPT: Ambulatory women aged 35–80 years and at least 5 years postmenopause. Minimum of one moderate or two mild atraumatic vertebral fractures prior to enrollment. For those with &lt;2 moderate fractures, or a T-score BMD of &lt;1.0 at LS or hip.</li> <li>Exclusion criteria specific of each study:</li> <li>Chinese osteoporosis study: Disease or medication (eg, corticosteroid) that affect</li> </ul>
	bone metabolism. Impaired renal/hepatic function. Skeletal radiotherapy. Malignant neoplasm within 5 years.
	- FPT: Disease or medication (eg, corticosteroid) that affects bone metabolism. Impaired renal/hepatic function. Urolithiasis within 5 years. Drug or alcohol abuse.
	Duration:
	- Chinese osteoporosis study: 24 weeks of treatment
	- FPT: median of 19 months of treatment
	Chinese osteoporosis study (N=228):
Interventions	Intervention: Teriparatide 20 $\mu g$ once daily administered via subcutaneous injection
	Control: Salmon calcitonin 200 IU once daily administered intranasally
	FPT (N=228):
	Intervention: Teriparatide 20 $\mu g$ or 40 $\mu g$ once daily administered subcutaneously
	Control: Placebo
Outcomes	Clinical fractures

# The FRAME (The FRActure study in postmenopausal woMen with ostEoporosis) Trial

### Cosman 2016

Methods	FRAME: RCT, parallel group
Participants	N=7180 6390 patients (89.0%) completed 12 months of the trial, and 6026 (83.9%) completed 24 months. Inclusion criteria: Ambulatory postmenopausal women, 55 to 90 years of age, with a T score of -2.5 to -3.5 at the total hip or femoral neck were eligible for participation. Exclusion criteria: Patients had to have at least two vertebrae in the L1 through L4 region and at least one hip that could be evaluated by means of dual-energy x-ray absorptiometry. Women who had a history of hip fracture, any severe or more than two moderate vertebral fractures, a history of metabolic bone disease or conditions affecting bone metabolism, osteonecrosis of the jaw, a 25-hydroxyvitamin D level of less than 20 ng per milliliter, current hypercalcemia or hypocalcemia, or recent use of drugs affecting bone metabolism (within defined washout periods; see the protocol) were excluded.

Interventions	Intervention: romosozumab 210 mg subcutaneous administration once monthly for 12 months followed by open-label denosumab 60 mg subcutaneous administration every 6 months for additional 12 months (N=3321)
	Control: placebo, subcutaneous administration once monthly for 12 months followed by open-label denosumab 60 mg subcutaneous administration every 6 months for additional 12 months (N=3322)
Outcomes	Clinical, vertebral and non-vertebral fractures

### Cosman 2018

Methods	Secondary, posthoc analysis based on FRAME: (ClinicalTrials.gov, NCT01575834), a phase 3, international, randomized, double-blind, placebo-controlled, parallel-group trial. For fracture efficacy, the current analysis focused on the RRRs in FRAME in the second year alone, when all patients were treated with the same active therapy—denosumab.
Participants	<ul> <li>7180 postmenopausal women with osteoporosis were included in the FRAME study.</li> <li>Inclusion criteria: Women were eligible for this study if they were between 55 and 90 years old, had a T-score of -2.5 to -3.5 at the total hip or femoral neck, and at least two vertebrae in the L1 through L4 region and at least one hip that could be evaluated by DXA.</li> <li>Exclusion criteria: Women who had a history of hip fracture, any severe or more than two moderate vertebral fractures, a history of metabolic bone disease or conditions affecting bone metabolism, osteonecrosis of the jaw, a 25-hydroxyvitamin D level of less than 20 ng per milliliter, current hypercalcemia or hypocalcemia, or recent use of drugs affecting bone metabolism (within defined washout periods; see the protocol) were excluded.</li> </ul>
Interventions	Intervention: romosozumab 210 mg, s.c. once monthly for 12 months (N= unclear) Control: placebo, s.c. once monthly for 12 months (N= unclear) Both treatment groups transitioned to denosumab 60 mg s.c. once every 6 months for an additional 12 months.
Outcomes	Clinical, major osteoporotic, vertebral, non-vertebral and hip fractures

### Cosman 2018

Methods	Posthoc analysis using the FRAME study: (ClinicalTrials.gov, NCT01575834), an international, randomized, double-blind, placebo-controlled, parallel-group, phase 3 study. Latin America, Central/Eastern Europe, Western Europe and Australia/New Zealand, Asia Pacific and North America
Participants	7180 women were included, from which 6390 (89%) completed 12 months of study The highest enrolling region was Latin America (43%) (vs. Rest-of-world (57%): non- Latin American population combined, which included Central/Eastern Europe, Western Europe and Australia/New Zealand and Asia Pacific)
	Inclusion criteria: ambulatory postmenopausal women, 55 to 90 years old, with a T-score of $-2.5$ to $-3.5$ at the total hip or femoral neck
	Exclusion criteria: history of hip fracture, any severe or more than two moderate vertebral fractures, a history of metabolic bone disease or conditions affecting bone

	metabolism, osteonecrosis of the jaw, a 25-hydroxyvitamin D level of less than 20 ng per milliliter, current hypercalcemia or hypocalcemia, or recent use of drugs affecting bone metabolism (within defined washout periods; see the protocol). Any severe or more than two moderate vertebral fractures, or history of hip fracture.
Interventions	Intervention: romosozumab 210 mg, sc monthly for 12 months (Latin America N=1550, Rest-of-world N=2039)
	Control: placebo, sc monthly for 12 months (Latin America N=1534, Rest-of-world N=2057)
	For both treatment groups: followed by open-label denosumab 60 mg, s.c. every 6 months for an additional 12 months.
Outcomes	Clinical, major osteoporotic, vertebral, non-vertebral and hip fractures

### McCloskey 2021

Methods	Independent post hoc analysis of the phase 3 FRAME study (NCT01575834): international, double-blind, placebo-controlled, parallel group trial.
Participants	Inclusion criteria and exclusion criteria: not described in this paper.
Interventions	Women with postmenopausal osteoporosis were randomly assigned to receive s.c once monthly for 12 months:
	Intervention 1: romosozumab 210 mg
	Control: placebo
	Followed by open-label denosumab (Prolia, Amgen), at a dose of 60 mg which was administered s.c every 6 months for an additional 12 months
Outcomes	Clinical fractures, osteoporotic fractures, major osteoporotic fractures, hip fractures, clinical vertebral fractures, nonvertebral fractures and morphometric vertebral fractures.

# The FREEDOM (Fracture Reduction Evaluation of Denosumab in Osteoporosis Every 6 Months) study

Adami 2012	
Methods	The FREEDOM trial: a 3-year, international, randomized, double-blind, placebo- controlled trial 214 centers in Europe, North America, South America, Australia and New Zealand
Participants	Data from 7808 women were available from the FREEDOM trial N=7762 - women received at least one dose of study treatment Inclusion criteria: women aged 60 to 90 years with a BMD T-score of -2.5 or less at the lumbar spine or total hip, but not less than -4.0 at either site. Exclusion criteria: There were no exclusion criteria based on renal function.
Interventions	Treatment duration: 3 years Intervention 1: Denosumab 60 mg, subcutaneous injection every 6 months (N=3886) Control 1: Placebo, subcutaneous injection every 6 months (N=3876)
Outcomes	Non-vertebral fractures

### Austin 2012

Methods	The FREEDOM trial: multinational, randomized, double-blind trial 214 centers
Participants	N=7808 Inclusion criteria: postmenopausal women with a BMD T-score < -2.5 at the lumbar spine or total hip and not < -4.0 at either site.
Interventions	Treatment duration: 3 years Intervention: Denosumab 60 mg, subcutaneous injection every 6 months (N=3902) Control: Placebo, subcutaneous injection every 6 months (N=3906)
Outcomes	Vertebral and non-vertebral fractures

### Boonen 2011

Methods	The FREEDOM trial: 3-year, randomized, double-blind, placebo-controlled, phase 3 trial - posthoc analysis in subgroups of women at higher risk of new vertebral and hip fractures 213 sites worldwide
Participants	The FREEDOM study enrolled 7808 women. Inclusion criteria: Ambulatory postmenopausal women with a BMD T-score less than - 2.5 at the lumbar spine or total hip but not less than -4.0 at either site were eligible to enroll in this study. Women with two or more vertebral deformities could be eligible, as long as there were no severe vertebral deformities and at most two moderate vertebral deformities Participants enrolled in both treatments were group according to their risk for new vertebral and hip fractures:

	<ul> <li>For new vertebral fractures the higher-risk subgroups included women with the following: 1) two or more preexisting vertebral fractures of any degree of deformity, or one or more vertebral fracture of moderate or severe deformity, or both (prevalent vertebral fracture status); 2) a femoral neck BMD T-score of -2.5 or less; or 3) both multiple and/or moderate or severe vertebral deformities and a femoral neck BMD T-score of -2.5 or less.</li> <li>For hip fractures the higher-risk subgroups included women: 1) 75 yr old or older; 2) with a femoral neck BMD T-score of -2.5 or less; or 3) 75 yr old or older and with a femoral neck BMD T-score of -2.5 or less.</li> </ul>
	Women who did not have the risk factor(s) specified were included in the lower-risk subgroups.
Interventions	Intervention: denosumab 60 mg, subcutaneous injection every 6 months (N=3886) Control: placebo, subcutaneous injection every 6 months (N=3876)
Outcomes	Vertebral and hip fractures. Vertebral fractures stratified by previous fracture risk

#### Cummings 2009

Methods	FREEDOM: RCT, parallel group
Participants	Inclusion criteria: Women between the ages of 60 and 90 years with a bone mineral density T score of less than -2.5 at the lumbar spine or total hip. Exclusion criteria: Women were excluded if they had conditions that influence bone metabolism or had taken oral bisphosphonates for more than 3 years. If they had taken bisphosphonates for less than 3 years, they were eligible after 12 months without treatment. Women were also excluded if they had used intravenous bisphosphonates, fluoride, or strontium for osteoporosis within the past 5 ye a r s; or parathyroid hormone or its derivatives, corticosteroids, systemic hormone-replacement therapy, selective estrogen-receptor modulators, or tibolone, calcitonin, or calcitriol within 6 weeks before study enrollment. Although consensus conferences have not specified a permissible risk of fracture for placebo-controlled trials,9,10 women were excluded if they had a bone mineral density T score of less than -4.0 at the lumbar spine or total hip or any severe (or more than two moderate) prevalent vertebral fractures. As part of the consent process, potential subjects were informed about alternative treatments for osteoporosis. Women were excluded if they had a serum 25-hydroxyvitamin D level of 12 to 20 ng per milliliter. Subjects with a baseline 25-hydroxyvitamin D level of 12 to 20 ng per milliliter were given at least 800 IU of vitamin D daily, and those with a baseline level above 20 ng per milliliter were given at least 400 IU daily. If total hip bone mineral density decreased by more than 7% during a 12-month period or by 10% or more during the study or if the T score dropped below -4.0, the subject was again counseled by the local study clinician about using alternative treatments in lieu of continuing to participate in the study.
Interventions	Treatment duration: 36 months Intervention: denosumab 60 mg, subcutaneous injections every 6 months (N=3902) Control: placebo, subcutaneous injections every 6 months (N=3906)
Outcomes	Vertebral, non-vertebral and hip fractures

#### Jamal 2011

Methods	FREEDOM Trial: a multicentre RCT
Participants	N=7808 Inclusion criteria: Women between 60 and 90 years of age with a BMD T-score of greater than 4.0 and less than 2.5 at the lumbar spine or total hip. Exclusion criteria: Women were excluded if they had current hyper- or hypoparathyroidism, current hypocalcemia (albumin-adjusted serum calcium concentration below 2.13 mmol/L) or vitamin D deficiency (25-hydroxyvitamin D level less than 30 nmol/L). There were no exclusion criteria based on serum measures of kidney function or urinary protein.
Interventions	Treatment duration: 36 months Intervention: denosumab 60 mg, subcutaneously every 6 months (N=3902) Control: placebo, subcutaneously every 6 months (N=3906)
Outcomes	Vertebral and non-vertebral fractures

### Kanis 2021

Methods	The phase 3 "Fracture Reduction Evaluation of Denosumab in Osteoporosis Every 6 Months" (FREEDOM) study: a double-blind, randomized, placebo controlled trial Multinational study of efficacy included women from Canada, Europe, Latin America, South America, and the USA
Participants	Inclusion criteria and exclusion criteria: not described in this paper.
Interventions	Intervention 1: 60-mg denosumab subcutaneously every 6 months for 36 months (N=3902) Control: placebo subcutaneously every 6 months for 36 months (N=3906) All women received supplements containing at least 1000 mg of calcium daily with vitamin D (400 to 800+ IU daily), the latter depending on the baseline serum 25- hydroxyvitamin D level.
Outcomes	Vertebral, non-vertebral and hip fractures

#### Kendler 2019

Methods	Posthoc analysis using data from the FREEDOM study, the placebo-controlled trial and its open-label extension
	FREEDOM trial: an international, multicenter, randomized, double-blind, placebo- controlled
	The FREEDOM Extension duration was up to 7 years, for a total of 10 years of denosumab treatment from the start of the FREEDOM study.
Participants	Inclusion criteria: FREEDOM Trial - eligible women were postmenopausal, 60–90 years old, with a lumbar spine or total hip BMD T-score less than –2.5 at either site, but greater than or equal to – 4.0 at both locations. Eligible women could not have had any severe, or more than two moderate, vertebral fractures and were free of other secondary causes of bone loss.

	FREEDOM Extension - women who completed the FREEDOM study 3-year visit and did not discontinue or miss more than one dose of investigational product in either the denosumab or placebo arm.
Interventions	<ul> <li>FREEDOM Trial (3 years)</li> <li>Intervention: denosumab s.c. 60 mg every 6 months for 3 years (N=272)</li> <li>Control: placebo s.c. every 6 months (N=438)</li> <li>FREEDOM trial + Expansion (10 years)</li> </ul>
	Patients who had received intervention or control during the trial period were schedule to receive subcutaneous open-label denosumab 60 mg every 6 months (± 1 month) during the extension period (N=794)
Outcomes	Clinical, vertebral, non-vertebral and hip fractures

#### McCloskey 2012

Methods	FREEDOM study: RCT, parallel group Canada, Europe, Latin America, South America, and the United States.
Participants	7808 women were included in FREEDOM study Inclusion criteria: women between the ages of 60 and 90 years (mean 72 years) who had a BMD T-score of less than -2.5 at the lumbar spine or total hip but not less than - 4.0 at either site.
Interventions	Treatment duration: 36 months Intervention: Denosumab 60 mg, subcutaneously every 6 months (N=3902) Control: placebo, subcutaneously every 6 months (N=3906)
Outcomes	Clinical and hip fractures

#### McClung 2012

Methods	FREEDOM study: RCT, parallel group Ambulatory, international and multicenter.
Participants	7808 women were included in FREEDOM study, the majority was white. Inclusion criteria: women aged 60 to 90 years with a BMDT-score <-2.5 at either the lumbar spine or total hip and >=-4.0at both sites. subjects with <=3 years of oral bisphosphonate use and no use within 1 year of enrollment could enroll in the study. Exclusion criteria: Women with more than two moderate vertebral fractures or any severe vertebral fracture, assessed by the semi quantitative grading of lateral spine radiographs. Subjects who had used oral bisphosphonates for >3 years.
Interventions	Treatment duration: 3 years Intervention: Denosumab 60 mg, subcutaneous injections every 6 months(N=3902) Control: placebo, subcutaneous injections every 6 months (N=3906)
Outcomes	Vertebral and non-vertebral fractures

#### Palacios 2015

Methods	Post-hoc analysis of the FREEDOM study
Participants	7808 women were included in the FREEDOM study Inclusion criteria: Women aged 60–90 years with a bone mineral density (BMD) T- score of less than -2.5 but not less than -4.0 at either the lumbar spine or total hip; women with previous therapy for osteoporosis were eligible as long as they had not used intravenous bisphosphonates or strontium within the past 5 years; an oral bisphosphonate for more than 3 years; or parathyroid hormone or its derivatives, systemic hormone replacement therapy, or selective estrogen receptor modulators within 6 weeks before study enrolment. If they had taken bisphosphonates for less than 3 years, they were eligible after 12 months without treatment. Exclusion criteria: women that had any severe or more than two moderate prevalent vertebral fractures.
Interventions	Treatment duration: 36 months Intervention: Denosumab 60 mg, subcutaneous injections every 6 months (N=3900) Control: placebo, subcutaneous injections every 6 months (N=3903)
Outcomes	Clinical fractures, analysis stratified by previous fracture history and by age

#### Simon 2013

Methods	Data from FREEDOM study, specifically: the DXA sub study, the QCT radius sub study and overall FREEDOM study. International, multicenter
Participants	<ul> <li>Inclusion criteria: postmenopausal women aged 60 to 90 years with a DXA BMD T-score lower than -2.5 at the lumbar spine or total hip.</li> <li>Exclusion criteria: women that had a BMD T-score lower than -4.0 at either site, any severe vertebral fracture or more than two moderate vertebral fractures, or conditions that affect bone metabolism; had taken oral bisphosphonates for more than 3 years; or had received intravenous bisphosphonates, fluoride, or strontium treatment for osteoporosis within the last 5 years.</li> </ul>
Interventions	Treatment duration: 36 months Intervention: denosumab 60 mg, subcutaneous injections every 6 months (N=3902) Control: placebo, subcutaneous injections every 6 months (N=3906)
Outcomes	Non-vertebral fractures

#### The FREEDOM and STAND studies

## Reid 2010 Analysis included data from two phase 3 clinical trials: - FREEDOM: 36-month randomized, double-blind, placebo-controlled phase 3 trial. Methods - STAND: Study of Transitioning from AleNdronate to Denosumab (STAND) was a 12month randomized, double-blind, double dummy, active-comparator phase 3 trial Inclusion criteria: - FREEDOM: Participants were ambulatory postmenopausal women from 60 to 90 years of age with a bone mineral density (BMD) T-score of less than -2.5 at the lumbar spine or total hip and greater than -4.0 at both sites. - STAND: Subjects were ambulatory postmenopausal women 55 years of age or older with BMD T-scores of between -2.0 and -4.0 at the lumbar spine or total hip. All participants had 6 months or more of prior alendronate treatment. **Participants** Excluded criteria: Both studies excluded women who had a disease or condition known to affect bone metabolism, as well as patients with prior intravenous bisphosphonate use. - FREEDOM: Women were excluded if they had used oral bisphosphonates for more than 3 years or if they had taken oral bisphosphonates for more than 3 months and the last dose was within 1 year of enrollment FREEDOM Intervention: denosumab 60 mg administered as a subcutaneous injection every 6 months Control: placebo Interventions STAND Intervention: subcutaneous denosumab 60-mg injection every 6 months plus an oral placebo tablet once weekly Control: placebo injection every 6 months plus a weekly oral alendronate tablet Outcomes **Clinical fractures**

## The HORIZON-PFT (Health Outcomes and Reduced Incidence with Zoledronic Acid Once Yearly (HORIZON) Pivotal Fracture Trial (PFT))

Methods	The Health Outcomes and Reduced Incidence with Zoledronic Acid Once Yearly (HORIZON) Pivotal Fracture Trial.
	Multicenter, United States and Germany
Participants	<ul> <li>N=7765</li> <li>Inclusion criteria: Postmenopausal women between the ages of 65 and 89 years were eligible for inclusion if they had a bone mineral density T score of -2.5 or less at the femoral neck, with or without evidence of existing vertebral fracture, or a T score of -1.5 or less, with radiologic evidence of at least two mild vertebral fractures or one moderate vertebral fracture. Previous use of oral bisphosphonates was allowed, with the duration of the washout period dependent on previous use (e.g., previous use of ≥48 weeks required 2 years of washout). Concomitant use of the following osteoporosis medications was allowed at baseline and during follow-up: hormone therapy, raloxifene, calcitonin, tibolone, tamoxifen, dehydroepiandrosterone, ipriflavone, and medroxyprogesterone.</li> <li>Exclusion criteria: Ineligibility criteria included any previous use of parathyroid hormone or sodium fluoride, use of anabolic steroids or growth hormone within 6 months before trial entry or oral or intravenous systemic corticosteroids within 12 months, and any previous use of strontium. Patients with a serum calcium level of more than 2.75 mmol per liter or less than 2.00 mmol per liter were ineligible, as wer patients with a calculated creatinine clearance of less than 30.0 ml per minute at either of two baseline visits or urine dipstick results of more than 2+ for protein, without evidence of contamination or bacteriuria.</li> </ul>
Interventions	Patients were followed until 36 months Intervention: zoledronic acid 5 mg, 15 minute intravenous administration at baseline (day 0), at 12 months, and at 24 months (N=3875) Control: placebo, 15 minute intravenous administration at baseline (day 0), at 12 months, and at 24 months (N=3861)
Outcomes	Clinical, vertebral, non-vertebral and hip fractures
lack 2021	3-year international, randomized, double-blind, placebo-controlled phase 3 study,
Methods	Health Outcomes and Reduced Incidence with Zoledronic Acid Once Yearly-Pivotal Fracture Trial (HORIZON-PFT).
	Multicenter, United States and Germany
Participants	N=7765 Inclusion criteria: postmenopausal women age 65 to 89 years were eligible if the following criteria were met; BMD T-score at the femoral neck <2.5 or T-score <-1.5 with at least two mild vertebral fractures or one moderate vertebral fracture. Previou use of oral bisphosphonates was allowed, with the duration of the washout period dependent on previous bisphosphonate use. The following concomitant osteoporosis

	raloxifene, calcitonin, tibolone, tamoxifen, dehydroepiandrosterone, ipriflavone, and medroxy-progesterone. Exclusion criteria: Participants were ineligible if any of the following criteria were met: any previous use of parathyroid hormone, strontium, or sodium fluoride; use of anabolic steroids or growth hormone within 6 months before study entry; intravenous systemic corticosteroids within 12 months; or a calculated creatinine clearance <30 mL/min
Interventions	<ul> <li>Patients were monitored for 3 years.</li> <li>Intervention: ZOL 5 mg, 15 minutes intravenous administration at baseline (day 0), at 12 months, and at 24 months (N=3862)</li> <li>Control: placebo infusion at baseline (day 0), at 12 months, and at 24 months (N=3852)</li> <li>All participants received oral daily calcium (1000 to 1500 mg) and vitamin D (400 to 1200 IU).</li> </ul>
Outcomes	Vertebral, non-vertebral and hip fractures

## Cauley 2011

Methods	The HORIZON-PFT: 3 year RCT 240 clinical centers in 27 countries
Participants	7736 women with established osteoporosis, 79% of the women were white Inclusion criteria: All women in the HORIZON trial were between the ages of 65 and 89 years, postmenopausal, and had a femoral neck bone mineral density (BMD) T-score of -2.5 or less with or without evidence of existing vertebral fractures or a T-score of - 1.5 or less with radiologic evidence of at least two mild or one moderate vertebral fracture. Prior bisphosphonate use was allowed, with the duration of washout period depending on duration of previous use.
Interventions	Intervention: Zoledronic acid 5 mg, 15-minute intravenous administration at baseline, 12 months and 24 months (N=3875) Control: placebo, 15-minute intravenous administration at baseline, 12 months and 24 months (N=3861)
Outcomes	Clinical fractures

## Eastell 2009

Methods	Subgroup analysis using data from HORIZON-PFT: a 36 month RCT, parallel group
Participants	Inclusion criteria: Postmenopausal women aged 65–89 yr were eligible for inclusion if they had a femoral neck T-score ≤ -2.5 with or without evidence of an existing vertebral fracture, or a T-score ≤ -1.5 with radiological evidence of at least two mild or one moderate vertebral fracture(s). Prior oral bisphosphonate use was allowed, with washout duration dependent on previous use (e.g. > 48 wk of usage required a 2-yr washout).
Interventions	Intervention: zoledronic acid 5 mg, single infusion at baseline, 12 and 24 months (N=3875) Control: placebo, single infusion at baseline, 12 and 24 months (N=3861)
Outcomes	Vertebral, non-vertebral and hip fractures

#### Jacques 2012

Methods	Data from HORIZON-PFT: a prospective, randomized, double-blind, placebo-controlled multinational trial
Participants	N=7736 Inclusion criteria: postmenopausal women that had a femoral neck BMD T-score of - 2.5 or less, with or without existing vertebral fracture, or a T-score of -1.5 or less, with radiological evidence of at least two mild vertebral fractures or one moderate vertebral fracture. Prior oral bisphosphonate use was allowed, with washout duration dependent on previous use (eg, >48 weeks of usage required a 2-year washout).
Interventions	Intervention: zoledronic acid, intravenous administration at baseline, 12 and 24 months (N=3875) Control: placebo, intravenous administration at baseline, 12 and 24 months (N=3861)
Outcomes	Vertebral and non-vertebral fractures

## Popp 2014

Methods	Sub study of HORIZON; follow-up: 3 years
Participants	<ul> <li>110 women were included in this analysis, mean age 77 years</li> <li>96 women completed the study over 36 months</li> <li>Inclusion criteria: <ul> <li>HORIZON Trial - Postmenopausal women between the ages of 65 and 89 years with osteoporosis, defined as a BMD T-score ≤ -2.5 at the FN with or without prevalent vertebral fracture or ≤-1.5 in the presence of at least two mild or one moderate vertebral fracture.</li> <li>Sub study of HORIZON - In addition to the HORIZON Trial inclusion criteria, women had to have received at least one dose of study drug, had attended at least one follow-up visit, and did not experience weight loss ≥ 10%.</li> </ul> </li> </ul>
Interventions	Intervention: 15-minute intravenous administration of ZOL 5 mg at baseline, 12 and 24 months (N=55) Control: placebo at baseline, 12 and 24 months (N=55)
Outcomes	Clinical, vertebral and non-vertebral fractures

## Liberman

#### Meunier 1997

Methods	RCT, parallel group, pooled data 18 sites in the USA and 19 sites in Australia, Canada, Europe, Israel, Mexico, New Zealand and South America
Participants	Inclusion criteria: Postmenopausal women between 45 and 80 yr of age (mean 63) with osteoporosis, defined as lumbar spine BMD at least 2.5 SD below the young adult mean, without the requisite of an existing fracture, were eligible for participation.
	Exclusion criteria: women with other causes of osteoporosis (e.g., treatment with glucocorticoids) or other disorders of bone and mineral metabolism (e.g., vitamin D deficiency, Paget's disease, or hyperparathyroidism); active peptic ulcer disease,

	abnormal renal function (serum creatinine level, >1.5 mg per deciliter [130 mmol per liter]), or abnormal hepatic function; abnormalities of the lumbar spine precluding the assessment of bone mineral density at a minimum of three lumbar vertebrae or a history of hip fracture; or any prior treatment with bisphosphonates or treatment within the preceding 12 months with estrogen, progestin, calcitonin, fluoride, or an anabolic steroid.
Interventions	Intervention: alendronate - 5 mg/day or 10 mg/day for 3 years; or 20 mg/day for 2 years followed by 5mg/day for the third year. (N=526) Control: placebo for 3 years (N=355)
Outcomes	Vertebral and non-vertebral fractures

#### Tucci 1996

Methods	RCT, parallel group 18 centers in the USA
Participants	478 women were enrolled in the study. 91% were Caucasian and 8% Asian Inclusion criteria: subjects were women 45 to 82 years of age who were postmenopausal for at least 5 years and who had osteoporosis as defined by a low lumbar spine bone mineral density (BMD) (less than 0.92 g/cm2 by Lunar DPX or less than 0.80 g/cm2 by Hologic QDR or Norland XI-26). Pre-existing vertebral fracture was not a requirement for eligibility. These subjects were otherwise in good health based on their medical history, physical examination, and laboratory screening evaluation, and were no more than 15% below or 30% above ideal body weight. Their spinal anatomy was suitable for dual-energy x-ray absorptiometry (DXA) of the lumbar spine, with at least three evaluable vertebrae from LI-L4. Exclusion criteria: Criteria for exclusion included: 1) metabolic disease known to alter skeletal or mineral metabolism, 2) cancer, history of any illness, or significant end- organ disease that might confound the results of the study or pose additional risk to the subject, 3) history of an osteoporotic fracture of the proximal femur, 4) active upper gastrointestinal disease, 5) significantly impaired renal function (serum creatinine >1.5 mg/dL), 6) use of medications known to alter skeletal or mineral metabolism, 7) daily use of medications which have appreciable potential for gastrointestinal irritation, and 8) use of any illicit drug, smoking of more than 20 cigarettes per day, habitual ingestion of greater than six cups of coffee per day, or more than two alcohol containing beverages per day.
Interventions	Intervention 1: alendronate 5 mg/day for 3 years(N=98) Intervention 2: alendronate 10 mg/day for 3 years (N=94) Intervention 3: alendronate 20 mg/day for 2 years, switched to 5mg/day for the 3 <sup>rd</sup> year (N=94) Control: placebo, daily for 3 years (N=192)
Outcomes	Non-vertebral fractures

## The MORE (Multiple Outcomes of Raloxifene Evaluation) study

## Agnusdei 2000

Methods	The MORE trial: 36 month, placebo-controlled, double-blind randomized trial. 180 centers in 25 countries.
Participants	<ul> <li>Baseline and follow-up radiographs were available for 6828 women (89%)</li> <li>Inclusion criteria: women aged 31 to 80 years (a mean age of 67 years), who were at least 2 years postmenopausal and had no severe or chronically disabling conditions but who had osteoporosis, defined by low BMD or X ray evidence of vertebral fractures.</li> <li>Women were divided in 2 groups:</li> <li>Study I: those whose femoral neck or lumbar spine BMD was more than 2.5 standard deviations below peak bone density,</li> <li>Study II: and those with ≥1 moderate or ≥2 mild vertebral fractures in the presence of low BMD (as specified for Study I) or ≥2 moderate fractures, regardless of BMD.</li> </ul>
Interventions	Study I Intervention: Raloxifene 60 mg or 120 mg per day (N= 2959) Control: placebo (N=1506) Study II Intervention: Raloxifene 60 mg or 120 mg per day (N= 1513) Control: placebo (N=757)
Outcomes	Vertebral and non-vertebral fractures. Vertebral fractures stratified by previous fracture history.

#### Barrett-Connor 2004

Methods	The MORE study consisted of a 3-year core treatment phase (a randomized, double- blind, placebo-controlled trial) followed by a 1-year extension phase for 4 years of total follow-up. During the 4 <sup>th</sup> year women were allowed to take other bone-active agents, except oral estrogen or estrogen-progestin therapy. Posthoc analysis of the MORE trial based on data reported through 4 years of follow- up. 180 sites in 25 countries
Participants	N=7705, primarily white (96%). Inclusion criteria: Participants were at least 2 years postmenopausal and had osteoporosis defined by a BMD T score of 2.5 SD or less at the lumbar spine or femoral neck or radiographically apparent fractures
Interventions	Intervention 1: Raloxifene 60 mg or 120 mg per day (N=5129) Control: placebo (N=2576)
Outcomes	Hip fractures

## Bjarnason 2001

Methods	The MORE trial 180 centers in 25 countries
Participants	Analysis based on 3-year follow-up data from 2722 women. The study was stratified for radiologically significant prevalent vertebral fractures such that one third of the women had prevalent vertebral fractures (sub study II) and two-thirds of the women had no significant deformities (sub study I). Inclusion criteria: postmenopausal women with a bone mineral density T-score of the spine or femoral neck below –2.5. Exclusion criteria: women diagnosed with an estrogen-sensitive cancer or had other diseases or treatments known to influence bone metabolism.
Interventions	Intervention: Raloxifene 60 mg or 120 mg per day (N=overall not stated) Control: placebo (N=overall not stated)
Outcomes	Vertebral fractures

### Delmas 2003

Methods	MORE: RCT, parallel group
Participants	<ul> <li>25 countries (including United States and Canada)</li> <li>N=7705</li> <li>Inclusion criteria: Women who were at least 2 years postmenopausal and had no severe or long-term disabling conditions, but who had osteoporosis, defined as low bone mineral density or radiographically apparent vertebral fractures.</li> <li>Exclusion criteria: Women were excluded if they had experienced bone disease other than osteoporosis, substantial postmenopausal symptoms or abnormal uterine bleeding, endometrial carcinoma, a history of or suspected breast carcinoma at any time, or a history of non-skin cancer in the previous 5y; taken an androgen, calcitonin or BP within the previous 6 mo; been taking oral estrogen within the previous 2 mo,; been receiving fluoride therapy for more than 3 mo during the previous 2y.; undergone systematic glucocorticoid therapy for more than 1 mo within the past year; taken antiseizure drugs or pharmacologic doses of cholecalciferl; had a history of thromboembolic disorders requiring therapy (except for type 2 diabetes or hypothyroidism)); had serum creatinine levels above 225 nmol/L (2.5 mg/dL); had active renal lithiasis, abnormal hepatic function, or untreated malabsorption; or consumed more than 4 alcoholic drinks per day. In addition, we excluded women with pathologic fractures, those from whom satisfactory thoracic and lumbar radiographs could not be obtained, and those with fewer than 2 lumbar and 4 thoracic vertebrae that were evaluable.</li> </ul>
Interventions	Treatment duration: 3 years Intervention: raloxifene 60 mg/day (N=2557) Intervention: raloxifene 120 mg/day (N=2572) Control: placebo, daily (N=2576)
Outcomes	Vertebral and non-vertebral fractures

Ettinger 1999

Methods	RCT, parallel group 180 centers in 25 countries (Approximately half the study subjects were recruited by a centralized campaign in the United States and Canada that used both print and radio advertisements.)
Participants	7705 women were enrolled in the study; 95.7% were white Inclusion criteria: women who were at least 2 years postmenopausal and had no severe or long-term disabling conditions but who had osteoporosis, defined as low bone mineral density or radiographically apparent vertebral fractures. Exclusion criteria: Women were excluded if they had experienced bone disease other than osteoporosis, substantial postmenopausal symptoms or abnormal uterine bleeding, endometrial carcinoma, a history of /or suspected breast carcinoma at anytime, or a history of non skin cancer in the previous 5 years; taken an androgen, calcitonin, or bisphosphonate within the previous 6 months; been taking oral estrogen within the previous 2 months; been receiving fluoride therapy for more than 3 months during the previous 2years; undergone systemic glucocorticoid therapy for more than 1 month within the past year; taken anti seizure drugs or pharmacologic doses of cholecalciferol; had a history of thromboembolic disorders within the last 10 years(except in association with an injury; experienced endocrine disorders requiring therapy (except for type 2 diabetes or hypothyroidism); had serum creatinine levels above 225 µmol/L (2.5 mg/dL); had active renal lithiasis, abnormal hepatic function, or untreated malabsorption; or consumed more than 4 alcoholic drinks per day. In addition, we excluded women with pathologic fractures, those from whom satisfactory thoracic and lumbar radiographs could not be obtained, and those with fewer than2 lumbar and 4 thoracic vertebrae that were evaluable.
Interventions	(Intervention 1 and 2: N=4536) Intervention 1: raloxifene 60 mg per day Intervention 2: raloxifene 120 mg per day Control: placebo (N=2292)
Outcomes	Vertebral, non-vertebral and hip fractures

#### Johnell 2004

Methods	MORE: a RCT, parallel group Multicenter in 25 countries (United States, Scandinavia, other parts of Europe, and other (Latin America and Asia)). Approximately half of the study subjects were recruited by a centralized campaign in the United States and Canada that used both print and radio advertisements
Participants	Inclusion criteria: women who were at least 2 years postmenopausal and had osteoporosis, defined as low BMD or a radiographically apparent vertebral fracture. Exclusion criteria: women were excluded if they had experienced bone disease other than osteoporosis, substantial postmenopausal symptoms or abnormal uterine bleeding, endometrial carcinoma, a history of or suspected breast carcinoma at any time, or a history of non-skin cancer in the previous 5 years; taken an androgen, calcitonin or BP within the previous 6 months; been taking oral estrogen within the previous 2 months; been receiving fluoride therapy for more than 3 months during the previous 2 years.; undergone systematic glucocorticoid therapy for more than 1 month within the past year; taken antiseizure drugs or pharmacologic doses of cholecalciferol; had a history of thromboembolic disorders within the last 10 years

	(except in association with an injury; experienced endocrine disorders requiring therapy (except for type 2 diabetes or hypothyroidism)); had serum creatinine levels above 225 $\mu$ mol/L (2.5 mg/dL); had active renal lithiasis, abnormal hepatic function, or untreated malabsorption; or consumed more than 4 alcoholic drinks per day. In addition, we excluded women with pathologic fractures, those from whom satisfactory thoracic and lumbar radiographs could not be obtained, and those with fewer than 2 lumbar and 4 thoracic vertebrae that were evaluable.
Interventions	Treatment duration: 3 years Intervention: raloxifene 60 mg or 120 mg per day (N=4536) Control: placebo, daily (N=2292)
Outcomes	Vertebral fractures

#### Kanis 2003

Methods	The MORE trial
Participants	N=3204 - subgroup of patients from the MORE study Inclusion criteria: women who were at least 2 years postmenopausal and had osteoporosis, defined by a T-score of 2.5 SD or less at the lumbar spine (L1–L4) or femoral neck based on the Hologic reference data or radiographically apparent fractures.
Interventions	Treatment duration: 36 months Intervention: raloxifene 60 mg/day (N=1577) Control: placebo, daily (N=1627)
Outcomes	Vertebral fractures, analysis stratified on LS T-score

#### Kanis 2010

Methods	MORE: a RCT, parallel group Data from the 2 sub-studies was combined Up to 36 months of follow-up for efficacy and non-serious adverse events and up to 40 months of follow-up for serious adverse events Multicenter in 25 countries
Participants	<ul> <li>7705 women were recruited in MORE</li> <li>Inclusion criteria: women aged 31 to 80 years in 25 countries who had been postmenopausal for at least 2 years and who met World Health Organization criteria for having osteoporosis. Study group 1 included those in whom femoral neck or lumbar spine bone mineral density T-score was below -2.5 SD. Study group 2 included women who had low bone mineral density and one or more moderate or severe vertebral fractures, or two or more mild vertebral fractures, or who had at least two moderate fractures regardless of their bone mineral density.</li> <li>Exclusion criteria: Women were excluded if they had bone disease other than osteoporosis, had taken systemic glucocorticoid therapy for more than 1 month within the previous year or consumed more than 4 alcoholic drinks daily.</li> </ul>
Interventions	Intervention 1: raloxifene 60 mg/day Intervention 2: raloxifene 120 mg/day Control: placebo, daily

Outcomes

Clinical, vertebral and non-vertebral fractures

### Maricic 2002

Methods	The MORE Trial: randomized, placebo-controlled, double-blind
Participants	The MORE Trial enrolled 7705 postmenopausal women with osteoporosis, defined by a lumbar spine or femoral neck BMD T score at or below 2.5 and/or radiographically apparent prevalent vertebral fractures.
Interventions	3 year treatment Intervention 1: raloxifene hydrochloride 60 mg/d (N=2572) Intervention 2: raloxifene hydrochloride 120 mg/d (N=2557) Control: placebo (N=2576)
Outcomes	Vertebral fractures

### Qu 2005

Methods	The MORE trial: a double-blind, randomized, placebo-controlled, 4-year trial 180 study centers
Participants	N=6828 Inclusion criteria: postmenopausal women with osteoporosis (defined by a lumbar spine or femoral neck bone mineral density (BMD) T-score ≤ –2.5 using the manufacturers' reference databases, and/or radiographically apparent prevalent vertebral fractures) in MORE, who had a baseline and at least one follow-up radiograph.
Interventions	Intervention 1: raloxifene 60 mg/day (N=2259) Intervention 2: raloxifene 120 mg/day (N=2277) Control: placebo (N=2292)
Outcomes	Vertebral fractures

#### Sarkar 2002

Methods	MORE trial, a 3-year RCT
Participants	<ul> <li>7705 women enrolled in the MORE trial, from which 6828 of them had at least 1 post-baseline BMD determination.</li> <li>Inclusion criteria: women at least 2 years postmenopausal</li> <li>Exclusion criteria: women that had bone disease other than osteoporosis, substantial postmenopausal symptoms, abnormal uterine bleeding, or endometrial carcinoma; women who had pathological fractures, women for whom satisfactory thoracic and lumbar spine radiographs could not be obtained, and women with fewer than two lumbar vertebrae that were evaluable.</li> </ul>
Interventions	Intervention: raloxifene 60 mg/day or 120 mg/day(N=4536) Control: placebo, daily (N=2292)
Outcomes	Vertebral fractures

#### Sarkar 2004

Methods	MORE trial, a 3-year RCT Data from a subgroup of women enrolled in the MORE trial; 17 centers in 5 countries (North America, South America and Europe)
Participants	<ul> <li>N=2503 women</li> <li>Inclusion criteria:</li> <li>MORE Trial: postmenopausal women with osteoporosis with either BMD at least 2.5 SD below the young adult mean or at least two radiographically apparent vertebral fractures women,</li> <li>Specific of this study: women had paired (baseline and endpoint) measurements of FN BMD, serum osteocalcin (OC), and bone-specific alkaline phosphatase (ALP).</li> <li>Exclusion criteria: women that had experienced a bone metabolic disease other than osteoporosis; had a history of or suspected breast cancer; had abnormal postmenopausal uterine bleeding or endometrial cancer; had a diagnosis of cancer other than skin cancer in the previous 5 years; used an androgen, calcitonin, or bisphosphonate within the previous 6 months; taken an oral estrogen within the last 2 months; had experienced a thromboembolic event within the last 10 years; received treatment for an endocrine disorder (other than type 2 diabetes or hypothyroidism); had renal lithiasis, abnormal hepatic function, or malabsorption; or consumed greater than four alcoholic drinks per day.</li> </ul>
Interventions	Intervention: raloxifene 60 mg/day or 120 mg/day (N=1650) Control: placebo, daily (N=853)
Outcomes	Vertebral fractures

#### Siris 2002

Methods	MORE trial
Participants	7705 women were enrolled in the MORE trial Inclusion criteria: women with osteoporosis, as defined by low bone mineral density (femoral neck or lumbar spine BMD T-score ≤ -2.5) and/or radiographically apparent vertebral fractures, who were at least 2 years postmenopausal.
Interventions	Treatment duration: 3 years Intervention 1: raloxifene 60 mg/day (N=2259) Intervention 2: raloxifene 120 mg/day (N=2277) Control: placebo, daily (N=2292)
Outcomes	Vertebral fractures, analysis stratified by previous fracture history
Sontag 2010	

Methods	The MORE trial, duration of 4 years: - a 3-year core treatment phase and - a 1-year extension phase (during which women were permitted to take other bone- active agents, except for oral estrogen or estrogen–progestin therapy) 180 sites in 25 countries
	180 sites in 25 countries
Participants	N=5114, primarily white (96%)

	Inclusion criteria:
	Patients were enrolled into two sub-studies:
	<ul> <li>One sub-study included patients whose femoral neck or lumbar spine BMD T-score was less than or equal to -2.5.</li> </ul>
	<ul> <li>The other sub-study included patients with low BMD and one or more moderate or severe vertebral fractures or two or more mild vertebral fractures, or who had at least two moderate fractures regardless of their BMD.</li> </ul>
	In the present report, prevalent vertebral fracture status was based upon the adjudicated fracture determination.
Interventions	Intervention: raloxifene 60 mg/day (N=2549)
	Control: placebo, daily (N=2565)
Outcomes	Vertebral fractures

## Silverman 2008

## Bueno 2017

Methods	3-year RCT, parallel-group, phase 3 trial 206 sites in Asia–Pacific countries, Canada, Europe, Latin America, South Africa, and the United States
Participants	Full inclusion/exclusion criteria and methodology are available in the primary publication (Silverman 2008). Inclusion criteria: generally healthy women who were at least 2 years postmenopausal and had osteoporosis. Exclusion criteria: presence of any diseases/conditions that might affect bone metabolism or interfere with densitometry, pathologic vertebral fractures, any serious conditions (eg, endometrial hyperplasia or carcinoma, abnormal vaginal bleeding, malignancy within 10 years), or vasomotor symptoms requiring treatment. Women with a history or presence of venous thromboembolic events (VTEs) were also excluded. Use of androgens, systemic estrogens (except estriol ≤2.0 mg/d), topical estrogens (>3 times/wk), progestogens, SERMs, bisphosphonates, calcitonin, parathyroid hormone, or cholecalciferol (>50,000 IU/wk) within 6 months before screening was also cause for exclusion.
Interventions	N=7492 received intervention or placebo. Intervention 1: Bazedoxifene 20 mg/d Intervention 2: Bazedoxifene 40 mg/d Intervention 2: Bazedoxifene 60 mg/d Control: placebo, once daily All participants received oral calcium (up to 1200 mg/d) and vitamin D (400-800 IU/d) supplements.
Outcomes	Vertebral fractures and non-vertebral fractures

#### Bruyère 2012

-	
Methods	RCT, phase 3 trial 206 sites in Asia–Pacific countries, Canada, Europe, Latin America, South Africa, and the United States
Participants	Data was available for 5244 women. Inclusion criteria: healthy women between the ages of 55 and 85 with at least 2 years since menopause and with osteoporosis, defined as low BMD or radiographically confirmed vertebral fractures. Subjects without prevalent vertebral fracture were required to have lumbar spine or femoral neck BMD T scores between -2.5 and -4.0 (inclusive), whereas subjects with prevalent vertebral fracture (at least one mild vertebral fracture) were required to have lumbar spine and femoral neck BMD T scores not worse than -4.0.
Interventions	3476 women were treated with Bazedoxifene. Intervention 1: Bazedoxifene 20 mg, taken orally once per day Intervention 2: Bazedoxifene 40 mg, taken orally once per day Control: placebo, taken orally once per day (N=1768)
Outcomes	Vertebral fractures
Kanis 2009 Methods	3-year RCT, parallel group
Wethous	Included women from the Asia/Pacific countries, Canada, Europe, Latin America, South Africa, and the United States.
Participants	<ul> <li>N=5643</li> <li>Inclusion criteria: Generally healthy women between the ages of 55 and 85yr were eligible for study inclusion if they were at least 2 yr postmenopausal and had osteoporosis, defined as low BMD or radiographically confirmed vertebral fractures. Subjects without prevalent vertebral fracture were required to have lumbar spine or femoral neck BMD T-scores between -2.5 and -4.0 (inclusive), whereas subjects with prevalent vertebral fracture (at least one mild vertebral fracture) were required to have lumbar spine and femoral neck BMD T-scores not worse than -4.0.</li> <li>Exclusion criteria: Women were excluded if they had diseases that may affect bone metabolism, conditions that could interfere with bone mineral densitometry,</li> </ul>

untreated malabsorption disorders. Subjects with an active or history of deep vein thrombosis, pulmonary embolism, orretinal vein thrombosis were also excluded, as were subjects with elevated fasting total cholesterol or triglyceride levels (≥310 or ≥300 mg/dl, respectively). The use of androgens, systemic estrogen (except estriol ≤2.0 mg/d), topical estrogen (>3 times/wk), progestogens, SERMs, bisphosphonates, calcitonin, PTH, and cholecalciferol (>50,000 IU/wk) was prohibited within 6 mo of screening.

	Intervention 1: bazedoxifene 20 mg/day (N=1886)
Interventions	Intervention 2: bazedoxifene 40 mg/day (N=1872)
	Control: placebo, daily (N=1885)

Outcomes

Clinical, vertebral and non-vertebral fractures

## Kaufman 2013

Methods	Phase III RCT, parallel group International, multicenter
Participants	<ul> <li>7492 women were included</li> <li>Inclusion criteria: Postmenopausal women aged 55 to 85 years who had osteoporosis, defined as a lumbar spine or femoral neck BMD T-score of≤-2.5 or presence of at least one radiologically confirmed prior vertebral fracture.</li> <li>Exclusion criteria: Exclusion criteria included diseases that affect bone metabolism, malignancy, endometrial hyperplasia or carcinoma, a history of venous thromboembolic disease, an abnormal lipid profile, or use of certain hormonal medications for 6 months prior to screening</li> </ul>
Interventions	Treatment duration: 3 years Intervention 1: bazedoxifene 20 mg/day (N=1886) Intervention 2: bazedoxifene 40 mg/day (N=1872) Intervention 3: raloxifene 60 mg/day (N=1849) Control: placebo, daily (N=1885)
Outcomes	Clinical, vertebral and non-vertebral fractures

## Silverman 2008

Methods	Phase 3 RCT, parallel group 206 sites in Asia-Pacific countries, Canada, Europe, Latin America, South Africa, and the United States
Participants	7492 women were randomized to treatment and received at least one dose of study medication; 87% were white Inclusion criteria: Generally healthy women between the ages of 55 and 85yr were eligible for study inclusion if they were at least 2 yr postmenopausal and had osteoporosis, defined as low BMD or radiographically confirmed vertebral fractures. Subjects without prevalent vertebral fracture were required to have lumbar spine or femoral neck BMD T-scores between −2.5 and −4.0 (inclusive), whereas subjects with prevalent vertebral fracture (at least one mild vertebral fracture) were required to have lumbar spine and femoral neck BMD T-scores not worse than −4.0. Exclusion criteria: Women were excluded if they had diseases that may affect bone metabolism, conditions that could interfere with bone mineral densitometry, pathologic vertebral fractures, vasomotor symptoms requiring treatment, or serious conditions such as endometrial hyperplasia or carcinoma, abnormal vaginal bleeding, malignancy within 10 yr of the study, endocrine disorders requiring treatment, or untreated malabsorption disorders. Subjects with an active or history of deep vein thrombosis, pulmonary embolism, or retinal vein thrombosis were also excluded, as were subjects with elevated fasting total cholesterol or triglyceride levels (≥310 or ≥300 mg/dl, respectively). The use of androgens, systemic estrogen (except estriol ≤2.0 mg/d), topical estrogen (>3 times/wk), progestogens, SERMs, bisphosphonates, calcitonin, PTH, and cholecalciferol (>50,000 IU/wk) was prohibited within 6 mo of screening.

Interventions	Intervention 1: bazedoxifene 20 mg, orally once daily (N=1886) Intervention 2: bazedoxifene 40 mg, orally once daily (N=1872) Intervention 3: raloxifene 60 mg, orally once daily (N=1849) Control: placebo, orally once daily (N=1885)
Outcomes	Vertebral fractures

## The VERO (The VERtebral fracture treatment comparisons in Osteoporotic women) Study

Methods	VERtebral fracture treatment comparison in Osteoporotic women (VERO) trial: International, multicenter, randomized, double-blind, active-controlled, parallel group, 24-month trial
	Clinical trial information: ClinicalTrials.gov Identifier: NCT01709110
Participants	Inclusion criteria: Eligible participants were ambulatory postmenopausal women aged > 45 years with a baseline bone mineral density (BMD) T-score less than or equal to -1.50 standard deviations (SD) at the femoral neck, total hip, or lumbar spine. Patients had to have radiographic evidence of at least two moderate (between a 26% and 40% reduction in vertebral body height) or one severe (more than 40% reduction in vertebral body height) prevalent vertebral fragility fractures according to the classification of Genant et al Prior use of bisphosphonates or other osteoporosis drugs was allowed. Exclusion criteria: Patients were excluded if they had (a) low serum 25-hydroxy-vitamin D levels (< 9.2 ng/mL or 23 nmol/L), (b) abnormally elevated serum intact parathyroid hormone (PTH [1-84]) at baseline (> 72 pg/mL or > 7.6 pmol/L), or (c) significantly impaired renal function as defined by a calculated endogenous creatinine clearance of < 30 mL/min/m <sup>2</sup> .
Interventions	Intervention: 20 μg daily of s.c. teriparatide plus an oral weekly placebo (N=680) Control: 35 mg weekly of oral risedronate plus daily injections of placebo (N=680)
Outcomes	Clinical, vertebral and non-vertebral fractures

## Geusens 2018

Methods	VERO: a RCT, parallel group
Participants	Inclusion criteria: post- menopausal women with at least 2 moderate or 1 severe VFx, according to the classification of Genant and colleagues, and a BMD T -score of -1.5 were enrolled. Exclusion criteria:
Interventions	Treatment duration: 24 months Intervention: 20 mg of s.c. teriparatide once daily plus oral weekly placebo (N=680) Control: 35 mg of oral risedronate once weekly plus daily injections of placebo (N=680)
Outcomes	Clinical and vertebral fractures

#### Geusens 2020

Methods	Post hoc analysis The vertebral fracture treatment comparisons in osteoporotic women (VERO): international, multicenter, randomized, double-blind, active-controlled, parallel-group, 24-month trial 116 centers in 14 countries across Europe, South and North America.
Participants	Inclusion criteria: Eligible participants were ambulatory postmenopausal women aged >45 years with a baseline BMD T-score less than or equal to $-1.50$ standard deviations (SD) at the femoral neck, total hip, or lumbar spine, assessed at the study site. Patients had to have radiographic evidence of at least two moderate (a reduction in vertebral body height of 26–40%) or one severe (>40% reduction) prevalent vertebral fragility fracture according to the classifcation of Genant et al. Prior use of bisphosphonates or other osteoporosis drugs was allowed. Exclusion criteria: Patients were excluded if they had (a) low serum 25-hydroxy-vitamin D levels (< 9.2 ng/mL or 23 nmol/L), (b) abnormally elevated serum intact
	parathyroid hormone (PTH [1-84]) at baseline (> 72 pg/mL or > 7.6 pmol/L), or (c) significantly impaired renal function as defined by a calculated endogenous creatinine clearance of < 30 mL/min/m <sup>2</sup> .
Interventions	Intervention 1: injectable subcutaneous teriparatide (20 µg daily) plus an oral weekly placebo Intervention 2: oral risedronate (35 mg weekly) plus an injectable subcutaneous daily placebo
Outcomes	Vertebral fractures

## Kendler 2018

Methods	The VERO study: randomised, double-blind, active-controlled, parallel-group trial 123 centers in 14 countries in Europe, South America and North America
Participants	<ul> <li>123 centers in 14 countries in Europe, South America and North America</li> <li>1366 women participated in the VERO study (680 women in each treatment group started the treatment); most of the participants were white</li> <li>1013 women completed the trial (74.2%)</li> <li>Inclusion criteria: ambulatory post-menopausal women older than 45 years of age with a bone mineral density T score less than or equal to -1.50 SDs at the femoral neck, total hip, or lumbar spine. Participants had to have radiographic evidence of at least two moderate (i.e., a reduction in vertebral body height of 26–40%) or one severe (more than 40% reduction) prevalent vertebral fragility fracture according to the classification of Genant and colleagues.</li> <li>Exclusion criteria: We excluded patients with unresolved skeletal diseases other than osteoporosis, malignant tumors in the 5 years before screening, osteonecrosis of the jaw, previous atypical subtrochanteric femoral fractures, risk factors for osteosarcoma, gastrointestinal disorders contraindicating risedronate, significantly impaired hepatic function, or a calculated creatinine clearance less than 30 mL/min using the Cockcroft–Gault equation. We also excluded patients who had undergone kyphoplasty or vertebroplasty at three or more levels before randomisation or within the 6 months before randomisation. Participants had to have normal baseline serum albumin-corrected calcium, parathyroid hormone, and free thyroxine concentrations, and 25-hydroxy-vitamin D concentration greater than 23 nmol/L.</li> </ul>

Interventions	Treatment phase of 24 months Intervention: injectable subcutaneous teriparatide 20 μg daily plus an oral weekly placebo (N=680)
	Control: oral risedronate 35 mg weekly plus injectable subcutaneous daily placebo (N=680)
Outcomes	Clinical, vertebral and non-vertebral fractures

#### Kendler 2020

Methods	The VERtebral fracture treatment comparisons in Osteoporotic women (VERO) trial: international, multicenter, randomized, double-blind, active-controlled, parallel-group, 24-month trial
Participants	<ul> <li>Inclusion criteria: ambulatory postmenopausal women over 45 years of age with a BMD T-score ≤-1.5 standard deviations at the femoral neck, total hip, or lumbar spine, and radiographic evidence of at least 2 moderate or 1 severe prevalent vertebral fragility fractures according to the classification of Genant et al</li> <li>Exclusion criteria: Exclusion criteria included low serum 25-hydroxy-vitamin D (25OHD) levels (&lt; 9.2 ng/mL or 23 nmol/L), abnormally elevated serum intact parathyroid hormone (PTH [1–84]) at baseline (&gt; 72 pg/mL or &gt; 7.6 pmol/L), and significantly impaired renal function as defined by a calculated endogenous creatinine clearance of &lt; 30 mL/min/m<sup>2</sup>.</li> </ul>
Interventions	Treatment 1: injectable subcutaneous teriparatide (20 μg) daily plus an oral weekly placebo Treatment 2: oral risedronate (35 mg) weekly plus injectable subcutaneous daily placebo
Outcomes	Vertebral, clinical, non-vertebral and major non-vertebral fractures

## Minisola 2019

Methods	The VERO study: an international, multicenter, randomized, double-blind, active- controlled, parallel-group, 24 months trial (ClinicalTrials.gov Identifier: NCT01709110).
Participants	<ul> <li>1360 women included in the VERO study; 74.2 % completed the 24-month trial</li> <li>Inclusion criteria: ambulatory postmenopausal women over 45 years of age with a bone mineral density Tscore ≤ – 1.5 standard deviations (SDs) at the femoral neck, total hip, or lumbar spine, and with radiographic evidence of at least two moderate or one severe prevalent vertebral fragility fracture according to the classification of Genant et al.</li> <li>Exclusion criteria: Patients with serum 25(OH)D levels &lt; 9.2 ng/mL (23 nmol/L) were excluded from the study, as well as patients with abnormally elevated values of serum intact parathyroid hormone (PTH) (1–84) at baseline defined as &gt; 72 pg/mL (or &gt; 7.6 pmol/L) and significantly impaired renal function as defined by a calculated endogenous creatinine clearance of &lt; 30 mL/min/m<sup>2</sup>.</li> </ul>
Interventions	Treatment duration: 24 months Intervention: injectable subcutaneous teriparatide 20 μg daily plus an oral weekly placebo (N=680) Control: oral risedronate 35 mg weekly plus injectable subcutaneous daily placebo (N=680)

## The VERT (Vertebral Efficacy with Risedronate Therapy) Trials

Harris 1999		
Methods	VERT: a RCT, parallel group 110 study centers in North America	
Participants	<ul> <li>2458 women met the entry criteria; 96% were white</li> <li>Inclusion criteria: No older than 85 years; if 5 years had elapsed since natural or surgical menopause, and if they had either 2 or more radiographically identified vertebral fractures (T4-L4, inclusive) or 1 vertebral fracture and lumbar-spine (L1-L4)</li> <li>BMD (defined as &lt;=0.83 g/cm2 [Hologic instrument] or &lt;=0.94 g/cm2 [Lunar instrument]). These values represent a t-score of -2 (2 SDs below the mean for young adults).</li> <li>Exclusion criteria: Women were excluded if they had conditions that might interfere with the evaluation of spinal bone loss, or if they had received drugs known to affect</li> </ul>	
	bone metabolism (such as calcitonin, calcitriol or cholecalciferol supplements within 1 mo prior to study entry; anabolic steroids, estrogen or estrogen-related drugs, or progestins within 3 mo; or biphosphonates, fluoride or subcutaneous estrogen implants within 6 mo).	
Interventions	Treatment duration: 3 years Intervention 1: risendronate 5 mg/day, once daily for 3 year (N=813) Control: placebo, once daily for 3 years (N=815)	
Outcomes	Vertebral, non-vertebral and hip fractures	

#### Kanis 2005

Methods	VERT-MN and VERT-NA: phase III RCT VERT-MN – Europe and Australasia VERT-NA – North America	
Participants	<ul> <li>N=1802 patients that had paired spine radiographs</li> <li>Inclusion criteria:</li> <li>VERT-MN – enrolled postmenopausal women with at least two prevalent vertebral fractures;</li> <li>VERT-NA – enrolled postmenopausal women with either low lumbar spine BMD (T-score ≤ -2 SD) and one radiographically confirmed prevalent vertebral fracture or at least two prevalent vertebral fractures irrespective of BMD.</li> <li>In both trials, patients were required to be ambulatory, &lt;85 years of age, and at least 5 years postmenopausal</li> <li>Exclusion criteria: Randomized trial of the effects of risedronate on vertebral fractures in women with established postmenopausal osteoporosis. Vertebral Efficacy with</li> </ul>	

	Risedronate Therapy (VERT) Study Group. Those patients enrolled because of low lumbar spine BMD and one prevalent vertebral fracture were excluded.	
Interventions	Treatment duration: 3 years Intervention: risedronate 5 mg, daily (N=892) Control: placebo, daily (N=910)	
Outcomes	Vertebral fractures	

## Reginster 2000

Methods	RCT, parallel group Study duration: 3 years 80 study centers in Europe and Australia	
Participants	1226 women were randomized Inclusion criteria: Ambulatory women up to 85 years old and at least 5 years postmenopausal were eligible if they had at least two radiographically confirmed vertebral (T4–L4) fractures.	
	Exclusion criteria: Exclusion criteria included conditions that might interfere with evaluation of spinal osteoporosis, and use of calcitonin, calcitriol or vitamin D supplements within 1 month, anabolic steroids, estrogen, estrogen-related drugs or progestogen within 3 months, or bisphosphonates, fluoride or subcutaneous estrogen implant within 6 months.	
Interventions	Intervention 1: risedronate 2.5 mg, once daily for 2 years (N=410) Intervention 2: risedronate 5 mg, once daily for 3 years (N=408) Control: placebo, once daily for 3 years (N=408)	
Outcomes	Vertebral, non-vertebral and hip fractures	

#### Watts 2003

Methods	Analysis using data from two similar randomized, double-blind, placebo-controlled studies of the effect of risedronate on vertebral fracture, Vertebral Efficacy with Risedronate Therapy (VERT) Multinational (VERT-MN) and VERT-North America (VE NA)		
Participants	<ul> <li>Inclusion criteria: In both studies, patients were required to be ambulatory, no older than 85 yr of age, and at least 5 yr postmenopausal:</li> <li>VERT-MN enrolled 1226 postmenopausal women at 80 centers in Europe and Australia. Patients in this study were required to have two or more prevalent radiographically confirmed thoracolumbar (T4–L4) vertebral fractures.</li> <li>VERT-NA enrolled 2458 postmenopausal women at 110 centers in North America. Patients were required to have two or more prevalent radiographically confirmed vertebral fractures (T4–L4) or one vertebral fracture and low lumbar spine (L1–L4) bone mineral density [BMD; defined as ≤0.83 g/cm2 (Hologic instrument) or ≤0.94 g/cm2 (Lunar instrument)]. The cutoff values for low lumbar spine BMD represent a T-score of -2 (2 SD values below the mean for young adults).</li> <li>Exclusion criteria: Women were excluded from the studies if they had conditions that might interfere with the evaluation of spinal bone loss, or if they had received drugs known to affect bone metabolism.</li> </ul>		

## The VERT trials and the HIP trial

#### Roux 2012

Methods	Posthoc analysis of subset of patients participating in three prospective, randomized, placebo controlled clinical trials, with durations of up to 3 years (Vertebral Efficacy with Risedronate Trial–MultiNational (VERT-MN); Vertebral Efficacy with Risedronate Trial–North America (VERT-NA); and the risedronate Hip Intervention Program (HIP)). North America, Multinational	
Participants	N=5454 Inclusion criteria: Subjects that had participated the VERT-MN, VERT-NA and HIP and that received risedronate 5 mg/day or placebo with paired evaluable spinal X-rays.	
Interventions	Intervention: Risedronate 5mg/day (N=2729) Control: placebo (N=2725)	
Outcomes	Vertebral fractures	

### Seibel 2004

Methods	Subgroup analysis using data from 3 large clinical trials - the multinational and the North American VERT (Vertebral Efficacy with Risedronate Therapy) and the HIP (Hip Intervention Program) studies.		
Participants	<ul> <li>N=1593</li> <li>Inclusion criteria:</li> <li>VERT trials - postmenopausal women with two vertebral fractures or one vertebral fracture and a low lumbar spine BMD (T-score &lt; -2 SD),</li> <li>HIP trial - postmenopausal women 70–79 years of age with low femoral neck BMD (T-score &lt; -3 SD) or at least 80 years of age with at least one non-skeletal risk factor for hip fracture,</li> <li>subset of patients specifically for this study: Patients from the VERT trial and patients with a baseline femoral neck T-score ≤ -2.5 SD from the HIP trial. Patients who had baseline measurements of urinary excretion of deoxypyridinoline and took at least one</li> </ul>		
	dose of study medication and had baseline and at least one post-baseline spinal radiograph. Treatment duration: 3 years		
Interventions	Intervention: risedronate 5 mg, daily (n=795) Control: placebo, daily (n=798)		
Outcomes	Vertebral fractures		

## Watts 2005

Methods	Analysis using data from 3 randomized, double-blind, placebo-controlled, parallel group, phase III clinical studies conducted in parallel: the Vertebral Efficacy with Risedronate Therapy North America (VERT-NA) and Multinational (VERT-MN) clinical studies and the Hip Intervention Program (HIP) study	
Participants	N=3979	
Interventions	Treatment duration: up to 3 years Intervention: risedronate 2.5 mg or 5 mg, daily (n=1418) Control: placebo, daily (n=2561)	
Outcomes	Non-vertebral fractures	

### The VERT and BMD trials

## Siris 2008

Methods	Posthoc analysis with data from the subsets of postmenopausal women with osteopenia from 4 RCTs: BMD Multinational, BMD North America, VERT Multinational and VERT North America.	
Participants	N=620 Inclusion criteria: postmenopausal women who had no radiographic vertebral fractures at baseline and had a femoral neck T-score between -1 and -2.5 SD as measured by DXA (NHANES III). Exclusion criteria: patients treated with estrogen and estrogen-related drugs within 3 months of study entry or for more than 1 month within 6 months of study entry.	
Interventions	Treatment duration: 1.5 to 3 years Intervention: risedronate 5mg/day (N=311) Control: placebo, daily (N=309)	
Outcomes	Major osteoporotic, vertebral and non-vertebral fractures	

## The ZEST (Zoledronic acid in frail Elders to STrengthen bone) study

## Greenspan 2015

Methods	ZEST (the Zoledronic acid in frail Elders to STrengthen bone study): a 2-year RCT, parallel group Pittsburgh, Pennsylvania area		
Participants	<ul> <li>N=181</li> <li>Inclusion criteria: We included frail women 65 years or older who resided in a nursing home or assisted-living facility, who were not receiving a bisphosphonate, and who had either a history of vertebral or hip fracture or a measured BMD below the treatment cutoff for osteoporosis (based on 2003 National Osteoporosis Foundation guidelines: lower than -2.0 SD at the spine, hip, or radius [i.e., more than 2 standard deviations below the bone density of a healthy 30-year-old]). All women whose 25-hydroxyvitamin D levels were lower than 20 ng/dL received vitamin D supplements (50 000 IU/wk for 2 months) and were rescreened. All participants received a daily divided dose of vitamin D (800 IU/d) and 1200 mg/d of elemental calcium (supplement plus diet). We included women who had cognitive and functional impairment, immobility, multiple medical conditions, and who were prescribed multiple medications (including glucocorticoids and antiseizure medications).</li> <li>Exclusion criteria: We excluded those with a projected life expectancy of less than 2 years or an estimated glomerular filtration rate below 30 mL/min.</li> </ul>		
Interventions	Intervention: zoledronic acid 5 mg, one infusion(N=89) Control: placebo, one infusion (N=92)		
Outcomes	Clinical and vertebral fractures		

<b>Reference</b> Author Year	Funding sources / Sources of support (as stated in the manuscript)	Conflict of interest (as stated in the manuscript)
Adachi 2009	Financial support for this research and its publication was provided by Merck & Co., Inc., Rahway, New Jersey, the manufacturer of Fosamax.	Drs. Adachi, Faraawi, O'Mahony, and Nayar have received funding from Merck for clinical studies and/or have acted as consultants or speakers for Merck. Dr. Massaad, Ms. Yacik, and Dr. Evans are employees of Merck and may hold stock options in the company. Dr. Adachi has received consultant's fees from, been a member of the speakers' bureau of, or participated in clinical trials for Amgen Canada Inc., AstraZeneca Pharmaceuticals LP, Eli Lilly Canada Inc., GlaxoSmithKline, Merck, Novartis Pharmaceuticals Corporation, Pfizer Inc., Procter and Gamble Pharmaceuticals, Roche Diagnostics Corp, sanofi-aventis Canada Inc., Servier, and Wyeth Pharmaceuticals.
Adami 2008	This study was funded by Lilly Research Laboratories, Eli Lilly andCompany, Indianapolis IN.	Drs. Li Xie, Gail P. Dalsky, and Adrien Sipos are full-time employees of Eli Lilly and Company. Dr. Javier San Martin was an employee of Eli Lilly and Company at the time the study was done. This study was funded by Lilly Research Laboratories, Eli Lilly and Company, Indianapolis IN.
Anastasilakis 2015	Not stated.	Athanasios D. Anastasilakis has received lecture fees and research grant from Amgen and lecture fees from Lilly; Stergios A. Polyzos has received lecture fee and research grant from Amgen; Athina Gkiomisi, Zacharias G. Saridakis, Dimitrios Digkas, Ilias Bisbinas, Grigorios T. Sakellariou, Athanasios Papatheodorou, and Panagiotis Kokkoris have nothing to declare. Polyzois Makras has received lecture fees and research grants from Amgen, and lecture fees from Glaxo, Lilly, Pfizer, Leo, Genesis, ELPEN, VIANEX. Neither Amgen nor Novartis had any implication in any stage of this study (study's conception and design, analysis and interpretation of data, drafting, or revising the manuscript).
Aro 2018	This investigator- initiated academic investigation had a shared funding from the Academy of Finland (contract #117058), Novartis Inc. (contract CDJN608 FI01), and Turku University Hospital (government- sponsored research contract #13705). The femoral component was RSA-marked by Stryker Inc., and the hospital purchased the implants without extra charge. The sponsors	The authors declare that they have no conflict of interest

	had no further role in the study.	
Ascott Evans 2003	This study was funded by Merck & Co, Inc, which markets alendronate.	Ms Vandormael and Drs Stuch and Melton are employees of Merck & Co, Inc and own stock in the company.
Barrett- Connor 2006	Supported by Eli Lilly, Indianapolis.	Dr. Barrett-Connor reports having received salary support from Eli Lilly for serving as principal investigator and as an investigator at a clinical site for the RUTH trial; having served on paid advisory boards for Merck, Eli Lilly, Procter & Gamble, and Amgen; and having received grant support from Amgen. Dr. Mosca reports having received consulting fees from Eli Lilly and Organon. Dr. Collins reports having received consulting fees from Eli Lilly, Berlex, Merck, Pantarhei, and Pfizer; having received lecture fees from Berlex, Merck, Pfizer, Novo Nordisk, and Organon; and having received grant support from Eli Lilly, Organon, and Merck. Dr. Grady reports having received salary support, by means of contracts with the University of California, San Francisco, from Berlex, Eli Lilly, Merck, Pfizer, and WyethAyerst Research and consulting fees for chairing a data and safety monitoring board at Organon. Dr. Kornitzer reports having received grant support and lecture fees from Eli Lilly, Merck, Bristol-Meyers Squibb, Sandoz, and AstraZeneca. Dr. Wenger reports having received salary support from Eli Lilly for serving as coprincipal investigator and as principal investigator at a clinical site for the RUTH trial; having received consulting fees from Eli Lilly, CV Therapeutics, NitroMed, Schering-Plough, and the Leadership Council for Improving Cardiovascular Care; having received speaker's fees from Pfizer, Novartis, Merck, Eli Lilly, and NitroMed; and having received research grants or contracts or having served on trial steering committees for Eli Lilly, AstraZeneca, and Pfizer. Dr. Geiger and Ms. McNabb are full-time employees and stockholders of Eli Lilly. No other potential conflict of interest relevant to this article was reported.
Bell 2002	Not stated.	Not stated.
Bock 2012	This study was supported by an unrestricted research grant from Roche Pharma AG.	Dieter Felsenberg has acted as a consultant and speaker for Roche, Novartis, Procter and Gamble and MSD but has not received royalties from the companies. Oliver Bock has acted as a speaker for the same companies. Other research studies of the Center for Muscle and Bone Research have been supported financially by Roche, Novartis, Procter and Gamble and MSD. Peter Martus received an institutional grant from Roche. All other authors have no conflicts of interest.
Body 2002	This work was supported by a grant from Eli Lilly and Co. (India- napolis, IN).	Not stated.

## S1 Fig. Funnel Plots

Funnel plot of comparison: Treatment vs. Placebo, outcome: Clinical fractures

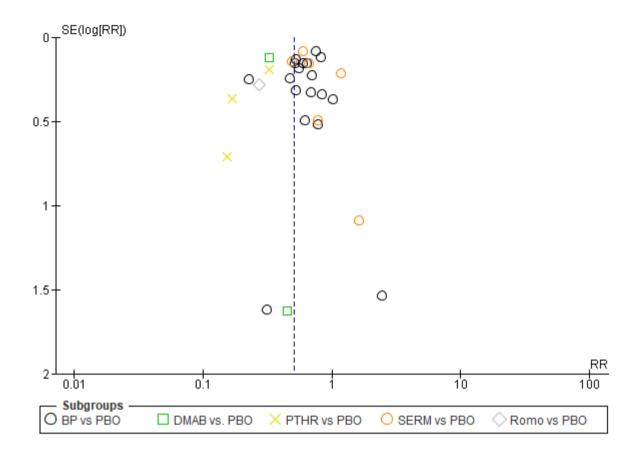

Abbreviations: Bisphosphonates [BP], denosumab [DMAB], parathyroid hormone receptor agonist [PTHR], placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM], SE [standard error], RR [risk ratio]

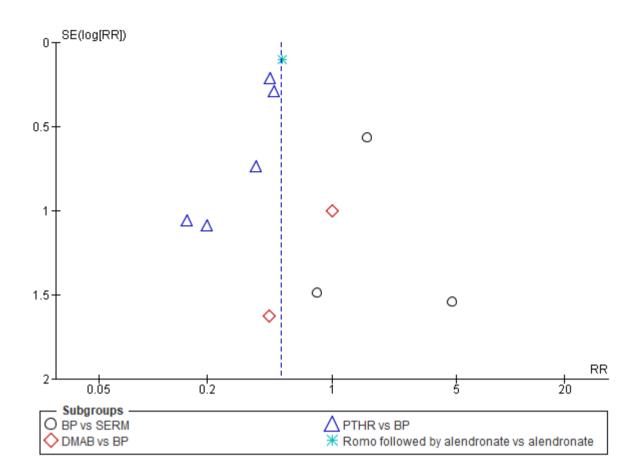

#### Funnel plot of comparison: Treatment vs. Comparator, outcome: Clinical fractures

Abbreviations: Bisphosphonates [BP], denosumab [DMAB], parathyroid hormone receptor agonist [PTHR], romosozumab [Romo], selective oestrogen receptor modulators [SERM], SE [standard error], RR [risk ratio]

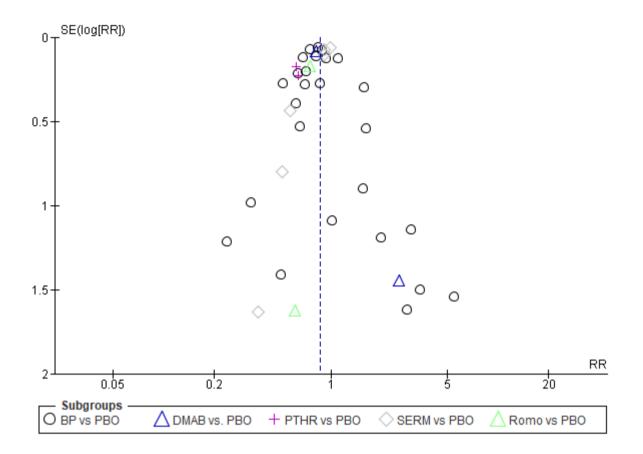

#### Funnel plot of comparison: Treatment vs. Placebo, outcome: Vertebral fractures

Abbreviations: Bisphosphonates [BP], denosumab [DMAB], parathyroid hormone receptor agonist [PTHR], placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM], SE [standard error], RR [risk ratio]

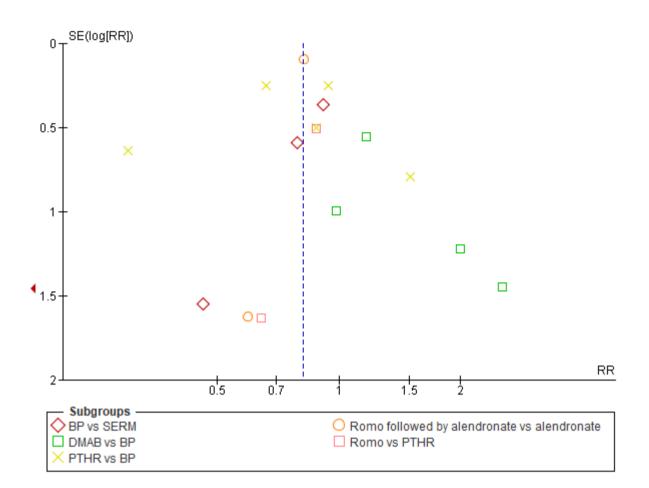

Funnel plot of comparison: Treatment vs. Comparator, outcome: Vertebral fractures

Abbreviations: Bisphosphonates [BP], denosumab [DMAB], parathyroid hormone receptor agonist [PTHR], romosozumab [Romo], selective oestrogen receptor modulators [SERM], SE [standard error], RR [risk ratio]

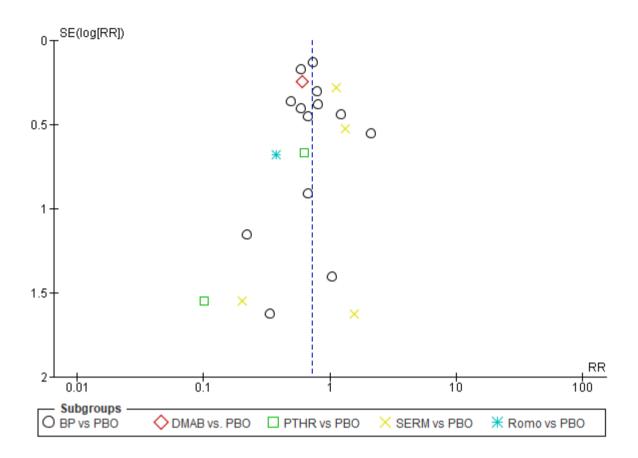

#### Funnel plot of comparison: Treatment vs. Placebo, outcome: Non-vertebral fractures

Abbreviations: Bisphosphonates [BP], denosumab [DMAB], parathyroid hormone receptor agonist [PTHR], selective oestrogen receptor modulators [SERM], SE [standard error], RR [risk ratio]

Funnel plot of comparison: Treatment vs. Comparator, outcome: Non-vertebral fractures

Abbreviations: Bisphosphonates [BP], denosumab [DMAB], parathyroid hormone receptor agonist [PTHR], romosozumab [Romo], selective oestrogen receptor modulators [SERM], SE [standard error], RR [risk ratio]

#### Funnel plot of comparison: Treatment vs. Placebo, outcome: Hip fractures

Abbreviations: Bisphosphonates [BP], denosumab [DMAB], parathyroid hormone receptor agonist [PTHR], placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM], SE [standard error], RR [risk ratio]

# S6 Table. Estimates of effects and quality ratings for comparison of drugs

Estimates of effects and quality ratings for comparison of drugs to prevent vertebral fractures

		Direct evidence	Network met	a-analysis
	<b>Relative Risk</b>	Absolute Risk*	Odds Ratio	Certainty of

Estimates of effects and quality ratings for comparison of drugs in relation to number of patients cardiovascular related serious adverse events

Abbreviations: Bisphosphonates [BP], confidence interval [CI], denosumab [Dmab], parathyroid hormone receptor [PTHR] agonists, placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM]. <sup>a</sup> Downgraded due to serious risk of bias; <sup>b</sup> Downgraded due to serious risk of inconsistency; <sup>c</sup> Downgraded due to

serious risk of indirectness; <sup>d</sup> Downgraded due to serious risk of imprecision; <sup>e</sup> Downgraded due to serious risk of publication bias.

## S7 Table. Cochrane Risk of Bias tool 2

Risk of bias assessment as assessed by the Cochrane risk of bias tool 2. The specific type of bias is presented in the top column, and the individual studies in the left row. The tool includes the following domains on risk of bias: arising from the randomization process (D1), due to deviations from the intended interventions (D2), due to missing outcome data (D3), in measurement of the outcome (D4), and in selection of the reported result (D5).

The crib sheet for parallel trials was applied, and we aimed to assess the effect of assignment to the intervention. The risk of bias was assumed to be equivalent across different fracture site outcomes. Each of the domains was scored as 'high', 'low' or 'some concerns' in relation to risk of bias. An overall risk of bias judgement for each study was made. High risk of bias was given if there was high risk of bias in at least one domain, or if three or more domains were rated to have some concerns. Low risk of bias was given if there were low risk of bias in all domains, and some concerns was given, if there were some concerns in at least one domain, but not high risk of bias in any of the domains. The following sources were obtained to help inform the risk of bias assessment: journal article(s), conference abstract(s), trial protocol or trial registry record (e.g. clinicaltrials.gov) and was therefore exclusively based on published information.

### events comparing treatment to other treatments

Footnotes (1) Estimates extracted from clinicaltrials.gov

Abbreviations: Bisphosphonates [BP], denosumab [DMAB], parathyroid hormone receptor [PTHR] agonists, romosozumab [Romo], selective oestrogen receptor modulators [SERM], confidence interval [CI].

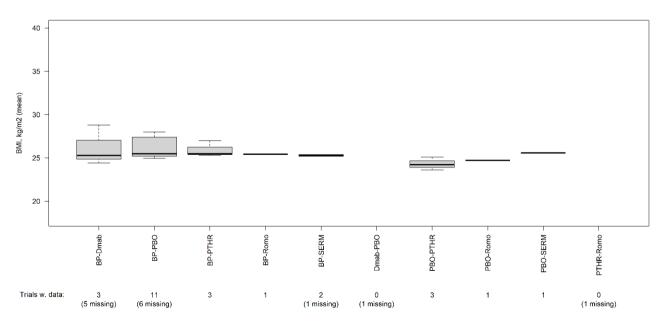

# S3 Fig. Distribution of baseline risk indicators across the direct comparisons included in network meta-analysis

The distribution of baseline risk indicator (mean age) across the direct comparisons included in the network metaanalysis

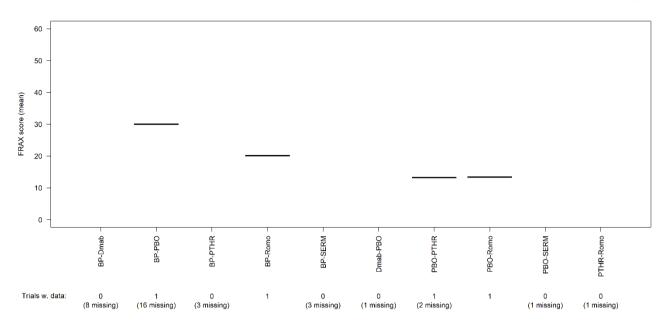

Abbreviations: Bisphosphonates [BP], denosumab [Dmab], parathyroid hormone receptor [PTHR] agonists, placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM].

The distribution of baseline risk indicator (mean BMI) across the direct comparisons included in the network metaanalysis

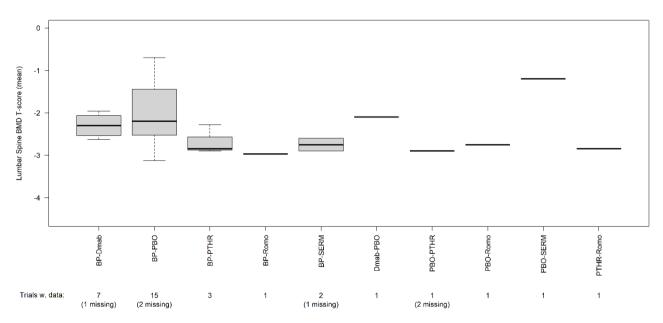

Abbreviations: Bisphosphonates [BP], body mass index [BMI], denosumab [Dmab], parathyroid hormone receptor [PTHR] agonists, placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM].

The distribution of baseline risk indicator (FRAX) across the direct comparisons included in the network meta-analysis

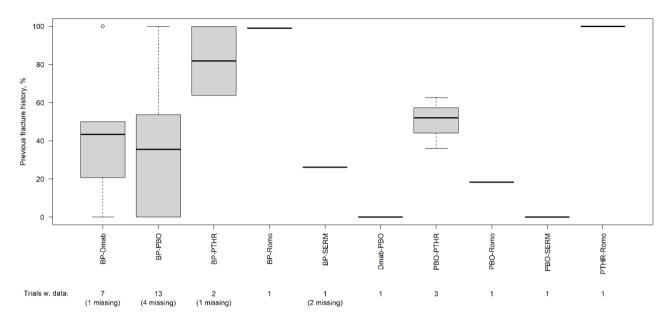

Abbreviations: Bisphosphonates [BP], denosumab [Dmab], parathyroid hormone receptor [PTHR] agonists, placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM].

The distribution of baseline risk indicator (lumbar spine BMD T-score) across the direct comparisons included in the network meta-analysis

Abbreviations: Bisphosphonates [BP], bone mineral density [BMD], denosumab [Dmab], parathyroid hormone receptor [PTHR] agonists, placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM].

The distribution of baseline risk indicator (previous fracture history) across the direct comparisons included in the network meta-analysis

Abbreviations: Bisphosphonates [BP], denosumab [Dmab], parathyroid hormone receptor [PTHR] agonists, placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM].

# S8 Table. Network meta-analysis, sensitivity analyses

Sensitivity analyses adjusting each group for the study duration multiplied by the specific number of participants randomly allocated (i.e., a proxy for patient-years) are presented in supplemental material

	Clini	cal fractures		VF	1	Non-VF		Нір		MOF

# Sensitivity analysis, safety outcomes

Abbreviations: adverse events [AE], cardiovascular related serious adverse events [SAE CVD], bisphosphonate [BP], confidence interval [CI], Denosumab [Dmab], odds ratio [OR], parathyroid hormone receptor agonist [PTHR], placebo [PBO], romosozumab [Romo]; selective oestrogen receptor modulators [SERM]

# S9 Table. Mean ranks on clinical fractures

Treatment	Mean rank
PTHR	1.40
Romo	2.31
SERM	2.92
BP	3.70
Placebo	5.14
Dmab	5.53

Abbreviations: Bisphosphonates [BP], denosumab [Dmab], parathyroid hormone receptor [PTHR] agonists, placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM].

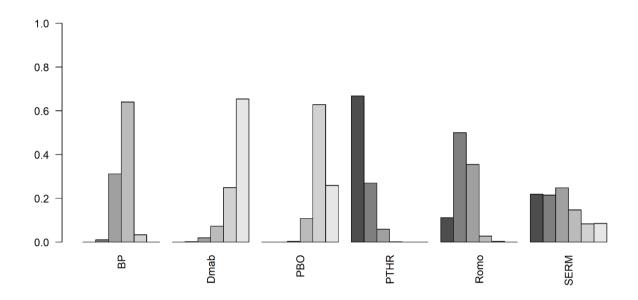

# S10 Table. SUCRA on clinical fractures

The surface under the cumulative ranking curve (SUCRA) is a numeric presentation of the overall ranking and presents a single number associated with each treatment on clinical fractures. SUCRA values range from 0 to 1. The higher the SUCRA value, the higher the likelihood that a therapy is in the top rank or one of the top ranks; the closer to 0, the more likely that a therapy is in the bottom rank, or one of the bottom ranks. Abbreviations: Bisphosphonates [BP], denosumab [Dmab], parathyroid hormone receptor [PTHR] agonists, romosozumab [Romo], selective oestrogen receptor modulators [SERM].

Treatment	SUCRA value
PTHR	0.921
Romo	0.737
SERM	0.616
BP	0.460
Placebo	0.172
Dmab	0.094

# S4 Fig. Rankogram on clinical fractures.

Histograms are shown for each treatment reflecting corresponding probabilities for each position in the ranking of the five interventions (rankograms). The shades of gray visualise the ranks; bars with the darkest gray colour are the probability of the treatment being ranked highest, and the bars with the lightest gray colour are the probability of the intervention being ranked the lowest. Abbreviations: Bisphosphonates [BP], denosumab [Dmab], parathyroid hormone receptor [PTHR] agonists, placebo [PBO], romosozumab [Romo], selective oestrogen receptor modulators [SERM].

#### Meta-regression on vertebral fracture risk

Abbreviations: bisphosphonate (BP), body mass index (BMI), bone mineral density (BMD), Fracture Risk Assessment Tool (FRAX), confidence interval (CI), year (y) Estimates from REML-based meta-regressions for the association between log(RR) for the outcome and the covariates were back-transformed. The slope,  $\beta$ , should be interpreted as the proportional increase (or decrease) in the treatment effect (i.e. risk ratio) pr. unit increase in the baseline risk indicator. <sup>§</sup> tau-squared for the model without the covariate

\* %tau<sup>2</sup><sub>explained</sub> was calculated as (tau<sup>2</sup><sub>model w. covariate</sub> - tau<sup>2</sup><sub>model without covariate</sub>)/tau<sup>2</sup><sub>model without covariate</sub>\*100.

<sup>+</sup> P-value from a Wald test for the effect of the covariate in the model. Bold p-values are presented as figures in Fig 1 and in supplemental material.
