Supplemental information

c-Maf-positive spinal cord neurons
are critical elements of a dorsal horn circuit
for mechanical hypersensitivity in neuropathy

Noémie Frezel, Matteo Ranucci, Edmund Foster, Hagen Wende, Pawel Pelczar, Raquel Mendes, Robert P. Ganley, Karolina Werynska, Simon d'Aquin, Camilla Beccarini, Carmen Birchmeier, Hanns Ulrich Zeilhofer, and Hendrik Wildner

Supplemental figures

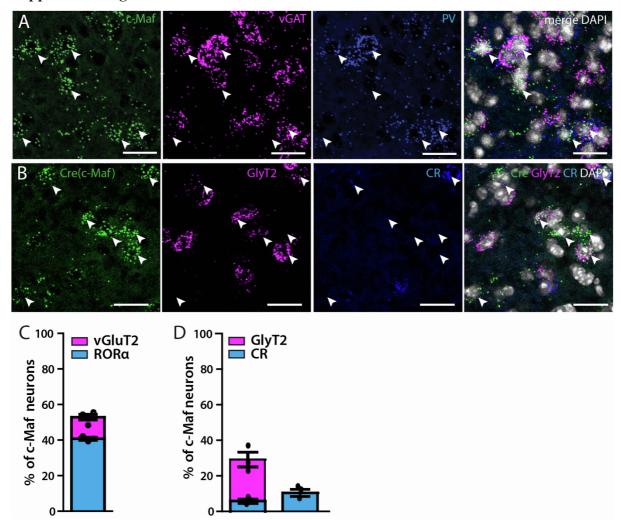

Fig. S1 (related to Fig. 1): ISH showing the proportion c-Maf⁺ neurons expressing other markers of deep dorsal horn neurons. A. A. Triple ISH showing overlap between c-Maf-, vGat- and PV-expressing neurons. c-Maf^{1N} neurons represent about a third (31.28 ± 1.6%) of all c-Maf neurons and they overlap with inhibitory PV⁺ interneurons (12.75% ± 0.6% of all c-Maf neurons are positive for vGat, i.e. half of the c-Maf⁺PV⁺ neurons. B. Triple ISH showing overlap of Cre (c-Maf)-, GlyT2-and CR-expressing neurons. C. Quantification of the overlap between Cre (c-Maf)-, vGluT2-and RORα -expressing neurons (ISH, n = 3 c-Maf^{Cre} mice; 302 Cre⁺ neurons). D. Quantification of (C) (n = 3 c-Maf^{Cre} mice; 302 Cre⁺ neurons). E. Quantification of the number of c-Maf neurons that are positive for both CCK and PV or both CCK and RORα (n = 4; 878 neurons, and n = 3; 317 neurons respectively). Arrowheads: examples of Cre (c-Maf) positive neurons. Error bars: ± SEM. Scale bars: A: 100 μm, B-C: 20 μm.

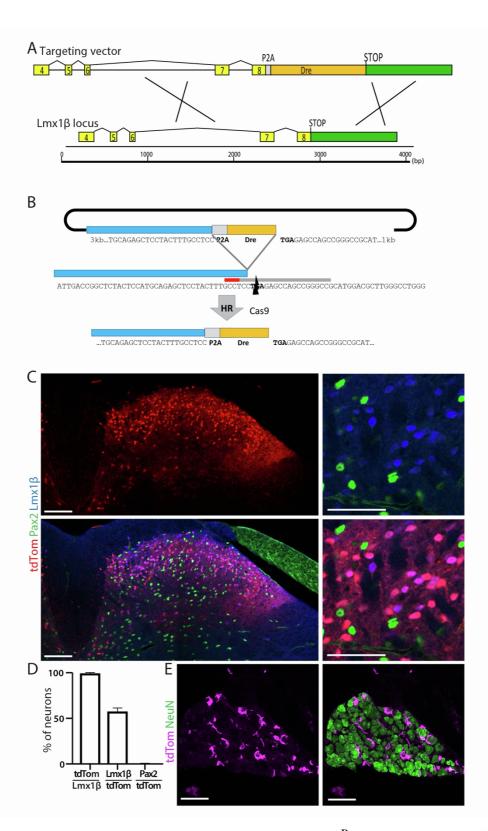

Fig. S2 (related to Fig. 2): Generation of the Lmx1b^{Dre} mouse line. A. Schematic representation of the generation of the Lmx1b^{Dre} allele. A *P2A-Dre* coding sequence was inserted into the STOP codon of the *Lmx1b* gene. **B.** The *Lmx1b* sequence proximal to the STOP codon was scanned using the CRISPOR software (http://crispor.tefor.net/) for the presence of optimal sgRNA target sequences. The target sequence attgtaggagaagactcaagagg

residing on the opposite strand and encompassing the *Lmx1b* STOP codon (in bold) was selected and the sgRNA targeting the sequence was transcribed *in vitro* using T7 polymerase (NEB) from a gBlock (IDT) linear DNA template containing the T7 promoter, the Cas9 target sequence and the sgRNA F+E backbone ^[S1]. An applicable targeting vector was designed to insert the P2A-Dre cassette just upstream of the *Lmx1b* STOP codon with the help of 2.6kb 5' and 1kb 3' homology arms. **C.** IHC showing the overlap between tdTomato, Pax2 and Lmx1b in Lmx1b^{Dre} mice crossed with tdTomato (Rosa26^{roxStopTom/wt}) reporter mice. **D.** Quantification of the overlap between tdTomato, Lmx1b and Pax2 in (C) **E.** IHC showing no expression of tdTomato in sensory neurons in Lmx1b^{Dre} mice crossed with tdTomato (Rosa26^{roxStopTom/wt}) reporter mice. tdTomato expression in DRGs is due to recombination in satellite glia. Error bars: ± SEM. Scale bars: B: 200 μm, C: 20 μm, E: 100 μm.

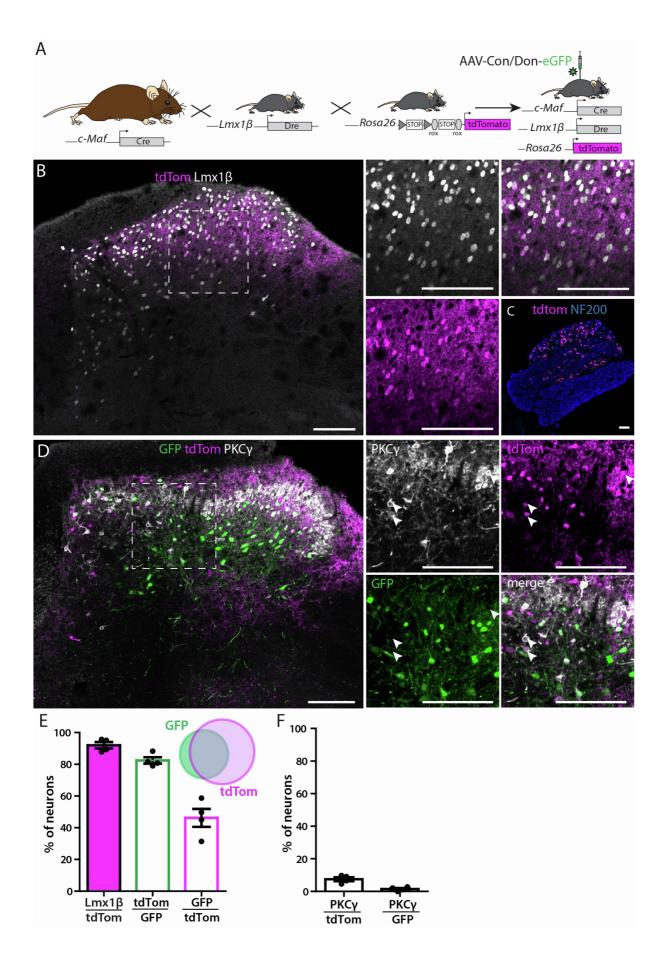

Fig. S3 (related to Fig. 2): Characterization of c-Maf^{Cre}; Lmx1b^{Dre}; Rosa26^{dstdTom/wt} (c-Maf^{EX}; Rosa26^{dstdTom/wt} mice). A. Crossing of c-Maf^{Cre} mice to Lmx1b^{Dre} mice, followed by crossing of the double transgenic line to tdTomato (Rosa26^{dstdTom/wt}) reporter mice, and intraspinal injection of rAAV9.CAG.Con/Don.eGFP. B. Immunofluorescence staining on a transverse section of lumbar spinal cord of c-Maf^{EX}; Rosa26^{dstdTom/wt} reporter mice, showing the overlap between tdTom⁺ and Lmx1b⁺ neurons. The general localization of tdTom⁺ neurons in adult mice spinal cord was very similar to that of eGFP⁺ neurons in c-Maf^{EX} mice after viral injection. C. Immunofluorescence staining of DRG sections in the same experiment, showing no expression of tdTomato in sensory neurons (n = 4 mice). **D.** Immunofluorescence staining on a transverse section of lumbar spinal cord of c-Maf^{EX}; Rosa26^{dstdTom/wt} reporter mice injected with rAAV9.CAG.Con/Don.eGFP showing the overlap between eGFP and tdTom and the location of labelled neurons relative to the PKCy plexus. E. Quantification of the number of tdTom⁺ neurons positive for Lmx1b⁺ in (B) (n = 4; 1523 neurons) and between eGFP⁺ and tdTom⁺ neurons (same samples as in Fig.3C; n = 4 mice; 1523 tdTom⁺ and 853 eGFP⁺ neurons). The vast majority of tdTom⁺ neurons expressed Lmx1b (92.03 \pm 2.0 % of tdTom⁺ neurons). 82.45 ± 2.03 % of eGFP⁺ neurons expressed tdTom. Conversely, 46.20 ± 5.7 % of tdTom⁺ neurons expressed eGFP. F. Quantification of the overlap between eGFP⁺ and tdTom⁺ neurons with PKC γ in (D) (n = 4 mice, 571 eGFP⁺ and 857 tdTom⁺ cells). In contrast to eGFP, tdTom was expressed in a few PKC γ^+ neurons (7.49 ± 1.16%) that had transiently expressed Cre and Dre during development. Arrowheads: examples of PKCγ⁺ tdTom⁺ neurons. Error bars: \pm SEM. Scale bars: 100 μ m.

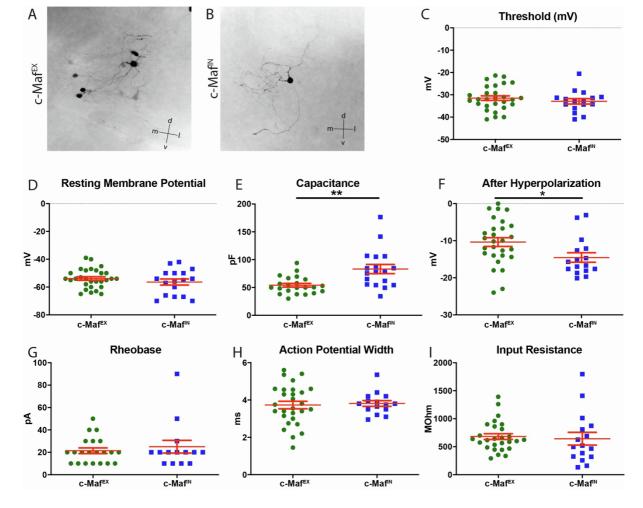

Fig. S4 (related to Fig. 2): Morphological and biophysical characterization of c-Maf^{EX} and c-Maf^{IN} neurons.

A, B. Neuronal morphology of c-Maf neurons revealed by sparse virus mediated labelling. **C-I.** Biophysical characterization of c-Maf^{EX} and c-Maf^{IN} neurons. **C.** Threshold potential, c-Maf^{EX} = -31.46 \pm 1.028 mV (n = 28), c-Maf^{IN} = -32.9 \pm 1.2 mV (n = 16), unpaired t-test p = 0.4. **D.** Resting membrane potential, c-Maf^{EX} = -53.9 \pm 1.3 mV (n = 29), c-Maf^{IN} = -56.4 \pm 2.2 mV (n = 17), unpaired t-test p = 0.3. **E.** Capacitance, c-Maf^{EX} = 54 \pm 3.3 pF (n = 22), c-Maf^{IN} = 83.2 \pm 8.2 pF (n = 18), unpaired t-test p = 0.001 **F.** After hyperpolarization, c-Maf^{EX} = -10.4 \pm 1.2 mV (n = 28), c-Maf^{IN} = -14.5 \pm 1.3 mV (n=16), unpaired t-test p = 0.03. **G.** Rheobase, c-Maf^{EX} = 21.4 \pm 2.5 pA (n=21), c-Maf^{IN} = 25.0 \pm 5.7 pA (n=14), unpaired t-test p = 0.5 **H.** Action potential width, c-Maf^{EX} = 3.7 \pm 0.2 ms (n=28), c-Maf^{IN} = 3.8 \pm 0.2 ms (n=15), unpaired t-test p = 0.8 **I.** Input resistance, c-Maf^{EX} = 681.9 \pm 51.3 MOhm (n=27), c-Maf^{IN} = 642.9 \pm 114.1 MOhm (n = 16) unpaired t-test p = 0.7. Error bars: \pm SEM.

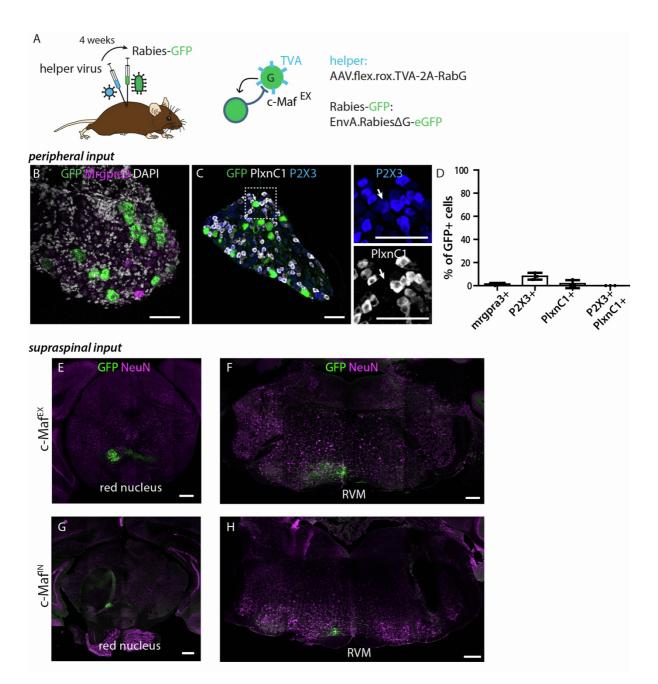

Fig. S5 (related to Fig. 3): Retrogradely labelled sensory neurons after rabies virus-based monosynaptic tracing from c-Maf^{EX} and c-Maf^{IN} neurons. A. A helper virus (TVA, RabG) was injected in the spinal cord of c-Maf^{EX} mice, followed by injection of the EnvA-pseudotyped rabies virus (EnvA.RV. Δ G.eGFP). **B.** Multiplex *in situ* hybridization on DRG sections showing overlap between *eGFP* and *Mrgpra3*. **C.** IHC on DRG sections showing the overlap between eGFP, PlxnC1 and P2X3. Arrow points to a GFP⁺; P2X3⁺; PlxnC1⁻ neuron. **D.** Quantification of the number of *eGFP*⁺ DRG neurons positive for *Mrgrpa3* (n = 3, 374 *eGFP*⁺ neurons), P2X3 and PlxnC1 (n = 3 mice, 152 eGFP⁺ neurons). P2X3⁺Plxnc1⁺ neurons = NP1-2-3 populations [S2]. **E-H.** Immunofluorescence staining showing eGFP labelled neurons in supraspinal sites retrogradely traced from c-Maf^{EX} (I-K) or c-Maf^{IN} (L-N) neurons. Neurons

were found in the red nucleus (RN), and in the rostroventral medulla (RVM) (n = 4). Error bars: \pm SEM. Scale bars: 30 μm (B,C) and 100 μm (E-H).

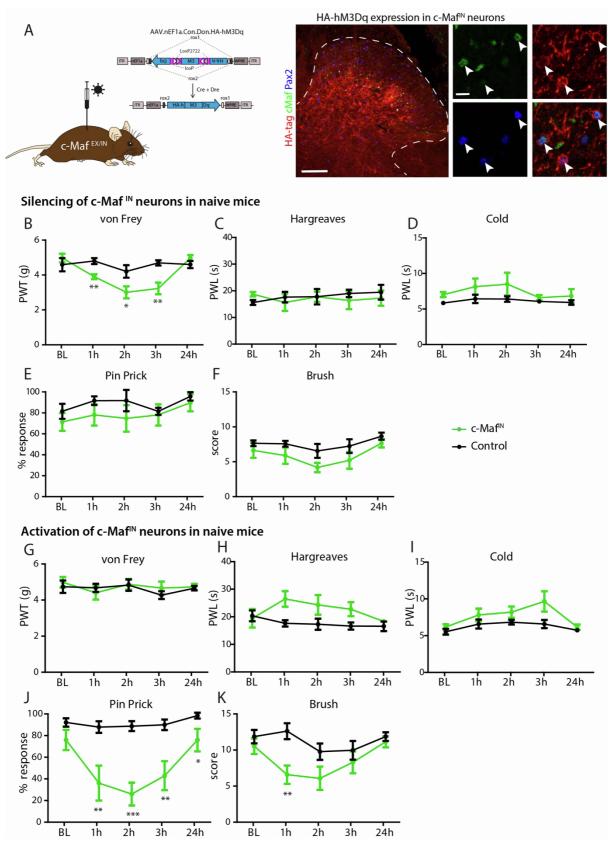

Fig. S6 (related to Fig. 4): Pharmacogenetic silencing and activation of c-Maf^{IN} spinal interneurons in naïve mice. A. Schematic representation of the viral construct used for encoding of Cre-and-Dre dependent transgenes ^[S3]. Representative image displays DREADD

expression (HA-tag) driven by the AAV.EF1 α .C_{on}/D_{on}.HA-hM3Dq injected into the lumbar spinal cord of c-Maf^{IN} mice. **B-F.** Behavioral responses after hM4Di-mediated silencing of c-MafIN neurons (hM4Di: c-MafIN: n = 5; control: n = 5, Table S1). **G-K.** Behavioral responses after hM3Dq-mediated activation of c-Maf^{IN} neurons (hM3Dq: c-Maf^{EX}: n = 5; control: n = 8; Table S1). Activation of c-Maf^{IN} neurons increased sensitivity to mechanical (Pin Prick and brush) stimulation. PWT: paw withdrawal threshold; PWL: paw withdrawal latency; BL: baseline (pre-CNO); 1h to 24h refers to time post CNO injection. Error bars: \pm SEM. Scale bars: 100 μ m (overview image) and 10 μ m (higher magnification images). Number of mice and statistics are shown in Table S1. In brief: * = p < 0.05, ** = p < 0.01, *** = p < 0.001 (ANOVA, followed by pairwise comparisons)

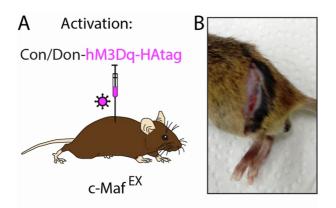

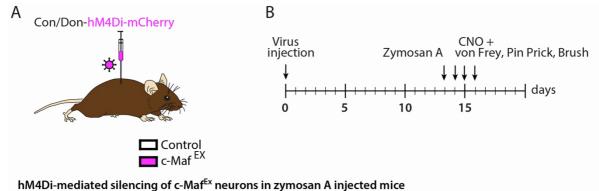

Fig. S7 (related to Fig. 4): Skin lesion induced by scratching and biting of the left flank after repeated CNO injection on mice expressing hM3Dq in c-Maf^{EX}.

A. rAAV.EF1α.C_{on}/D_{on}.hM3Dq was injected into the lumbar spinal cord of c-Maf^{EX} and control mice. The mice received CNO injections from 14 days after virus injection. **B.** c-Maf^{EX} mice receiving repeated CNO injections also developed skin lesions on the flank ipsilateral to the hM3Dq virus injection over the course of 8-15 days.

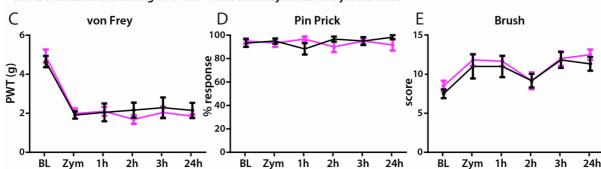

Fig. S8 (related to Fig. 5): Pharmacogenetic Activation of c-Maf^{EX} spinal interneurons in Zymosan A-induced inflammatory pain. A. DREADD expression was driven by injection of rAAV.EF1 α .Con/Don.hM3Dq into the lumbar spinal cord of c-Maf^{EX} and control mice. B. Virus injection was followed by intraplantar injection of zymosan A to induce inflammatory pain. C-E: Responses to mechanical stimulation using the von Frey (C), Pin prick (D) or light brush (E) tests before and after induction of inflammatory pain with zymosan A injection (c-Maf^{EX}: n = 6; control: n = 6, Table 2). PWT: paw withdrawal threshold; BL: baseline before injury; Zym: BL 24 hours after intraplantar injection of zymosan A and before CNO injection; 1h to 24h refers to time post CNO injection. Error bars: \pm SEM. Number of mice and statistics are shown in Table 2.

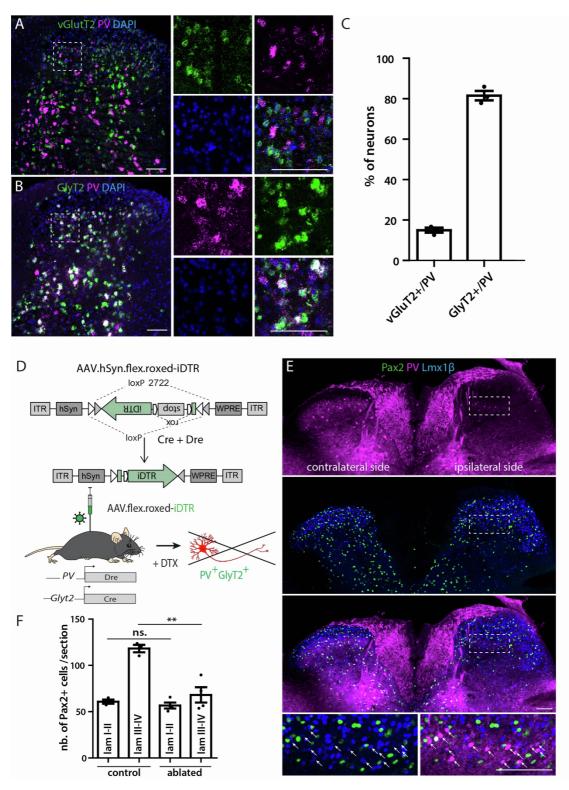

Fig. S9 (related to Fig. 6): Characterization and ablation of PV^{IN} dorsal horn neurons. A. Multiplex *in situ* hybridization showing the overlap between vGluT2⁺ and PV^+ neurons in the spinal dorsal horn. **B.** ISH showing the overlap between $GlyT2^+$ and PV^+ in the spinal dorsal horn. **C.** Quantification of (A) and (B) (n = 3; 469 PV+ neurons). The majority of PV^+ neurons are inhibitory (PV^{IN}) as expected [S4,5] (81.57 \pm 2.3% express GlyT2), and a smaller

subpopulation is excitatory ($14.99 \pm 1.2\%$ express vGluT2). **D.** PV^{IN} neurons were ablated by injection of a virus carrying a transgene for a Cre-and-Dre dependent iDTR (AAV1.EF1 α -flex-rox.iDTR(HB-EGF).hGH) followed by i.p. injection of DTX in GlyT2::Cre; Pvalb^{Dre} double transgenic mice. **E.** IHC showing the ablation of PV⁺ neurons in the dorsal horn. The majority of remaining PV⁺ neurons are excitatory (Lmx1b⁺Pax2⁻, white arrows in bottom insets). **F.** Quantification of (E) in laminae I-II and III-IV of the dorsal horn (DH) (n = 3 control mice; 608 Pax2⁺ neurons; n = 4 ablated mice; 679 Pax2⁺ neurons). Error bars: \pm SEM. Scale bars: 100 μ m.
