Supplemental Material

Source-Specific Air Pollution Including Ultrafine Particles and Risk of Myocardial Infarction: A Nationwide Cohort Study from Denmark

Aslak Harbo Poulsen, Mette Sørensen, Ulla Arthur Hvidtfeldt, Jesper H. Christensen, Jørgen Brandt, Lise Marie Frohn, Matthias Ketznel, Christopher Andersen, and Ole Raaschou-Nielsen

Table of Contents

Table S1. Main categories of the Selected Nomenclature for Air Pollution (SNAP) classification used in the Danish emission inventory.

Table S2. Cohort (N=1,964,702) characteristics at baseline (last of: 1 January 2005 and age 50 years), above and below median of PM_{2.5} and UFP concentration over previous 5 years, in Denmark, 2005-2017.

Table S3. Spearman rank correlations between 5-year time weighted average air pollution concentration at residences of all cohort members, Denmark, 2005-2017, N=1,964,702.

Table S4. Spearman rank correlations between area level socioeconomic factors and individual socioeconomic factors and air pollutant concentrations. Air pollution is 5-year time weighted average air pollution concentration at residences of each cohort member. Denmark, 2005-2017, N=1,964,702.

Table S5. Spearman rank correlations between 1, 5 and 10-year average air pollution concentration at residential addresses of all cohort members. Denmark, 2005-2017, N=1,964,702.

Table S6. Linear associations between MI and air pollutants, total and by source, per fixed unit. Fully adjusted model 3. Denmark, 2005-2017, N=1,964,702.

Table S7. Associations between MI and categories of air pollutants concentration: overall and by traffic or non-traffic sources. Denmark, 2005-2017, N=1,964,702.

Table S8. Associations between MI and categories of PM_{2.5} from traffic, traffic-tailpipe and traffic-non-tailpipe. Denmark, 2005-2017, N=1,964,702.

Table S9. Akaike Information Criterion (AIC) analyses, comparing model fit of fully adjusted models (model 3) including five year average air pollutants either linearly or categorically. Model adjusted for age, sex, calendar period, marital status, education, occupational status, ethnicity, personal and household income and percentage of parish population: living in social housing, being sole providers, of non-western origin, having low income, being unemployed, having blue collar work, having only basic education and having a criminal record.

Table S10. Associations between air pollutants and MI; exposure calculated as running averages over the past 1, 5 and 10 years, expressed per IQR and per fixed unit increments. Denmark, 2005-2017, N=1,964,702.

Table S11. Sensitivity analysis of associations between MI (cases=71,285) and 5-year averages of air pollutants, total and by source. Denmark, 2005-2017, N=1,964,702. Person years: 18,309,319

Table S12. Annual contributions from different SNAP source categories to Danish air pollution in 2010. Note that contributions from ships have been singled out from SNAP 08: Other mobile sources and machinery.

Figure S1. Modelled (purple) and measured (red) UFP and NO₂ concentrations as average time variation at three timescales (day, year, week) at the street station HCAB (Copenhagen, Denmark, dense traffic, 2002-2016).

Figure S2. Year of entry for all cohort members. Year 2005 or age 50, whichever came first.

Figure S3. Distribution of PM_{2.5}, UFP, BC and NO₂ concentrations as 5-year average over addresses held 2010 to 2014, by source: Danish road traffic versus other sources.

Figure S4 a-d. Associations between MI and 5-year time weighted averages of PM_{2.5} (A), UFP (B), EC (C) and NO₂ (D) from non-traffic sources, specified both in categories and as linear variables in the fully adjusted model 3 (Adjusted for age, sex, calendar period, marital status, education, occupational status, ethnicity, personal and household income and percentage of parish population: living in social housing, being sole providers, of non-western origin, having low income, being unemployed, having blue collar work, having only basic education and having a criminal record) Categories defined from percentiles of exposure: <10% (reference), 10-25%, 25-50%, 50-75%, 75-90%, 90-95% and >95%, HRs and 95% confidence intervals are plotted at the median of each category. The linear estimates from Table 2 with 95% confidence intervals are plotted with the median of the categorical reference category as the null (i.e. =1). (Table S7 holds the same information in tabulated form).

Figure S5 a-d. Associations between MI and 5-year time weighted averages of PM_{2.5} (A), UFP (B), EC (C) and NO₂ (D) from traffic sources, specified both in categories and as linear variables in the fully adjusted model 3 (Adjusted for age, sex, calendar period, marital status, education, occupational status, ethnicity, personal and household income and percentage of parish population: living in social housing, being sole providers, of non-western origin, having low income, being unemployed, having blue collar work, having only basic education and having a criminal record). Categories defined from percentiles of exposure: <10% (reference), 10-25%, 25-50%, 50-75%, 75-90%, 90-95% and >95%, HRs and 95% confidence intervals are plotted at the median of each category. The linear estimates from Table 2 with 95% confidence intervals are plotted with the median of the categorical reference category as the null (i.e. =1). (Table S7 holds the same information in tabulated form).

Figure S6 a-b. Associations between MI and 5-year time weighted averages of PM_{2.5} from non-tailpipe (A) and tailpipe sources (B), specified both in categories and as linear variables in the fully adjusted model 3 (Adjusted for age, sex, calendar period, marital status, education, occupational status, ethnicity, personal and household income and percentage of parish population: living in social housing, being sole providers, of non-western origin, having low income, being unemployed, having blue collar work, having only basic education and having a criminal record). Categories defined from percentiles of exposure: <10% (reference), 10-25%, 25-50%, 50-75%, 75-90%, 90-95% and >95%, HRs and 95% confidence intervals are plotted at the median of each category. The linear estimates from Table 2 with 95% confidence intervals are plotted with the median of the categorical reference category as the null (i.e. =1). (Table S8 holds the same information in tabulated form).

Figure S7. Contributions from different SNAP source categories to Danish air pollution in 2010. Note that contributions from ships have been singled out from SNAP 08: Other mobile sources and machinery.

Table S1. Main categories of the Selected Nomenclature for Air Pollution (SNAP) classification¹ used in the Danish emission inventory

SNAP categories	
SNAP 01	Combustion in energy and transformation industries
SNAP 02	Non-industrial combustion plants
SNAP 03	Combustion in manufacturing industry
SNAP 04	Production processes
SNAP 05	Extraction/distribution of fossil fuels and geothermal energy
SNAP 06	Solvents and other product use
SNAP 07	Road transport
SNAP 08	Other mobile sources and machinery
SNAP 09	Waste treatment and disposal
SNAP 10	Agriculture
SNAP 11	Other sources and sinks

Table S2. Cohort (N=1,964,702) characteristics at baseline (last of: 1 January 2005 and age 50 years), above and below median of PM_{2.5} and UFP concentration over previous 5 years, in Denmark, 2005-2017.

------------------------	---------------	---------------	---------------	---------------

^a: Short: vocational training, secondary education or <2 years of post-secondary education. Medium or long >2 years of post secondary education

^b: White collar, high level: Managers/directors with ≥5 employees and people with employment that requires high level skills. White collar, low level: Managers with 0-4 employees and people with employment that requires intermediate level skills. Blue collar: employment that requires low level skills.

^c: we applied age and calendar year specific quintiles to account for inflation and income disparities by sex. In 2017 the 20th 40th 60th and 80th percentile in dkr were 142 926, 198 363, 249 053, and 312 717 for women and 147 235, 219 142, 281 097, and 370 134 for men.

^d: we applied age and calendar year specific quintiles to account for inflation and income disparities by sex for singles. In 2017, the 20th 40th 60th and 80th percentile per adult in household, in dkr, were 174 497, 229 476, 286 079, and 365 263 for women and 171 817, 232 821, 290 162, and 369 949 for men.

^e: Publicly funded non-profit housing estates, where a third of the apartments can be used by municipalities for persons in need.

Table S3. Spearman rank correlations between 5-year time weighted average air pollution concentration at residences of all cohort members, Denmark, 2005-2017, N=1,964,702.

^a: adjusted for age, sex and calendar year (in 2 year categories), marital status, education, occupational status, ethnicity and personal and household income, area level percentage of population: living in social housing, being sole providers, of non-western origin, having low income, being unemployed, having blue collar work, having only basic education and having a criminal record.

^b: Running calendar year in 2-year categories included as strata instead of as covariate

^c: Analysis restricted to people ≥ 50 year of age in 2005, i.e. with year of entry=2005

Table S12. Annual contributions from different SNAP source categories to Danish air pollution in 2010. Note that contributions from ships have been singled out from SNAP 08: Other mobile sources and machinery.²⁻⁴

Snap category	PM_{2.5} 10²¹ Particles/year	UFP Kiloton/Year
01: Combustion in energy and transformation industries	3,546	1.54
02: Non-industrial combustion plants	63,904	21.09
03: Combustion in manufacturing industry	12,986	0.55
04: Production processes	10,644	2.91
05: Extraction/distribution of fossil fuels and geothermal energy	1,042	0.21
06: Solvents and other product use	3,547	1.12
07: Road transport	33,162	5.65
08: Other mobile sources and machinery - except Ships	22,481	3.37
08: Ships	98,294	3.54
09: Waste treatment and disposal	1,019	1.35
10: Agriculture	1,726	2.25
11: Other sources and sinks	0	0

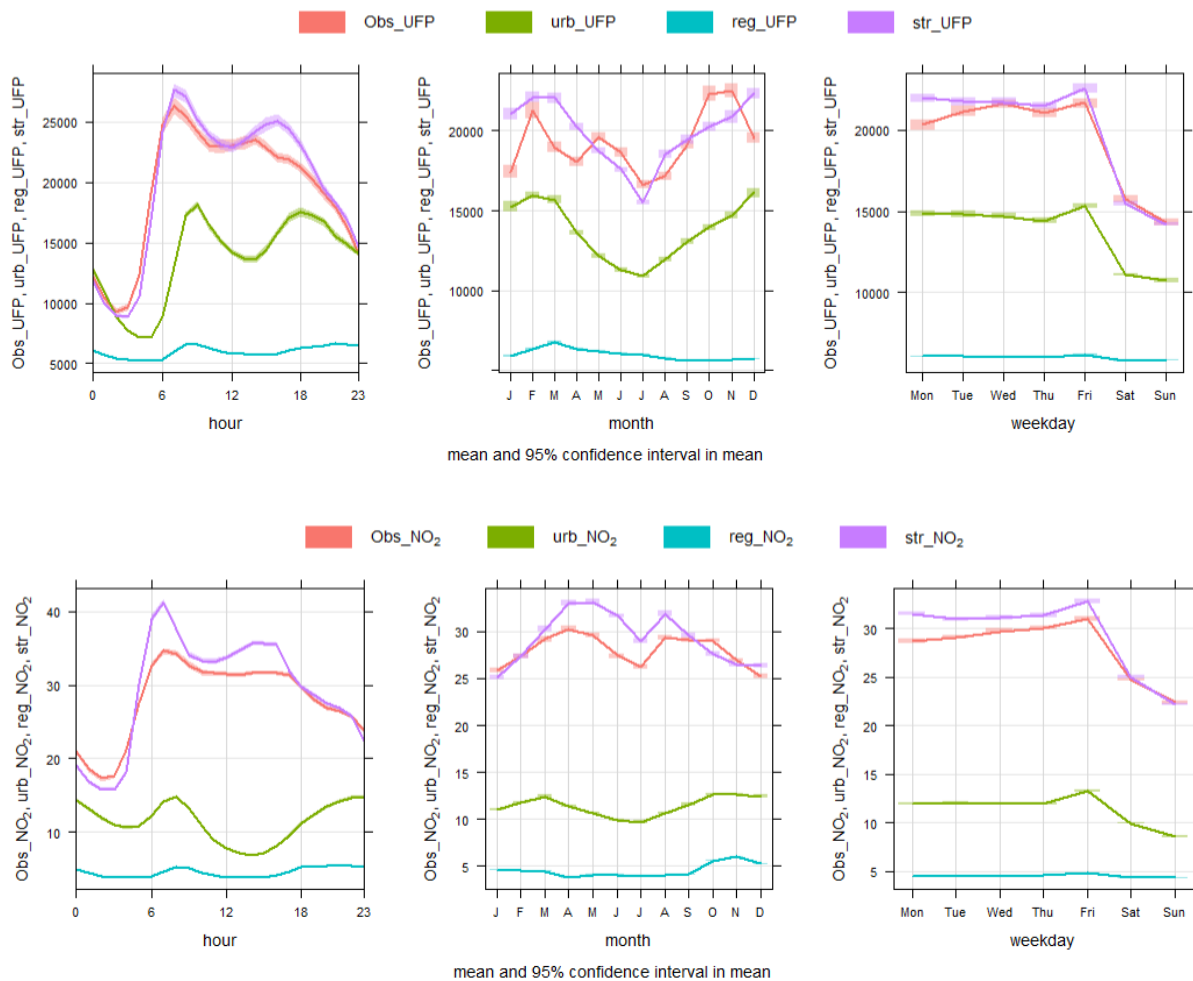

Figure S1. Modelled (purple) and measured (red) UFP and NO₂ concentrations as average time variation at three timescales (day, year, week) at the street station HCAB (Copenhagen, Denmark, dense traffic, 2002-2016).

Note:

Obs_UFP, red= measured UFP (in #/cm³), str_UFP, purple= Modelled UFP, reg_UFP, blue= contribution to total (purple) from DEHM model. Urb_UFP, green= contribution to total (purple) from UBM model.

Obs_NO₂, red= measured NO₂ (in ppb), str_NO₂, purple= Modelled NO₂, reg_NO₂, blue= contribution to total (purple) from DEHM model. Urb_NO₂, green= contribution to total (purple) from UBM model.

European Monitoring and Evaluation Programme 2022, Geels 2021, Plejdrup 2021

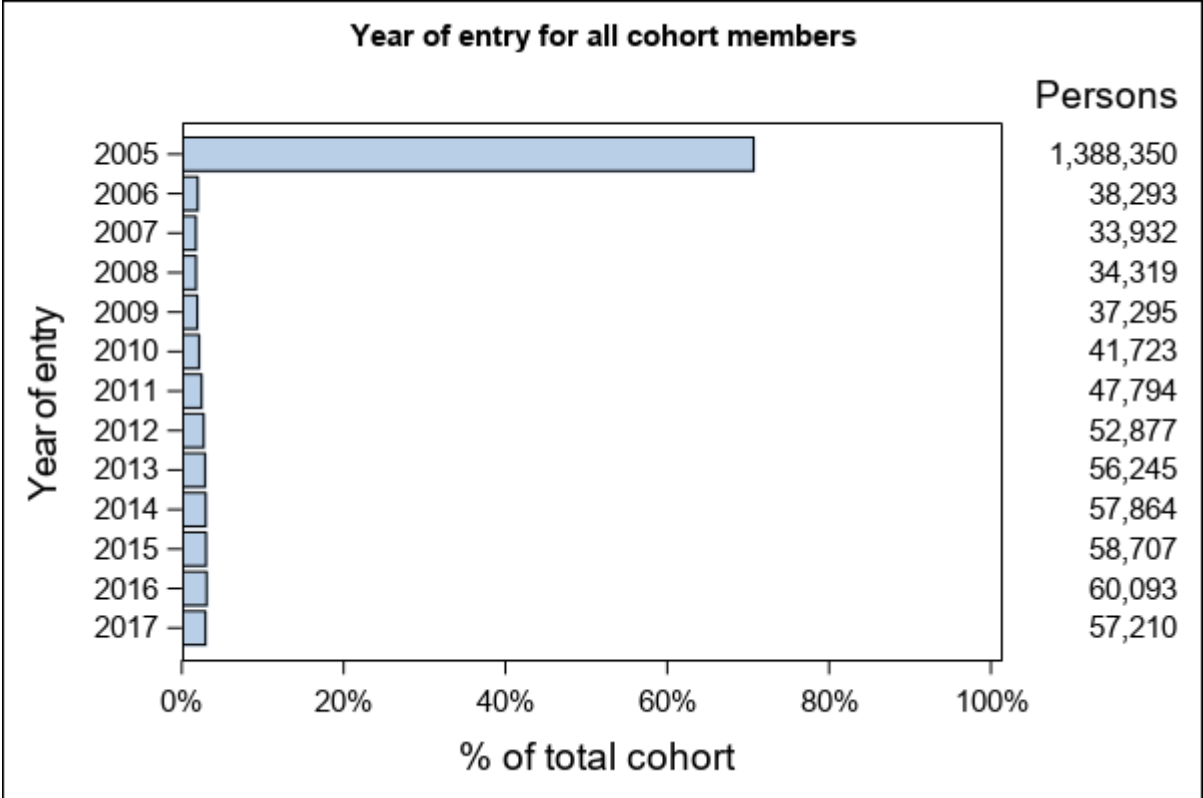

Figure S2. Year of entry for all cohort members. Year 2005 or age 50, whichever came first.

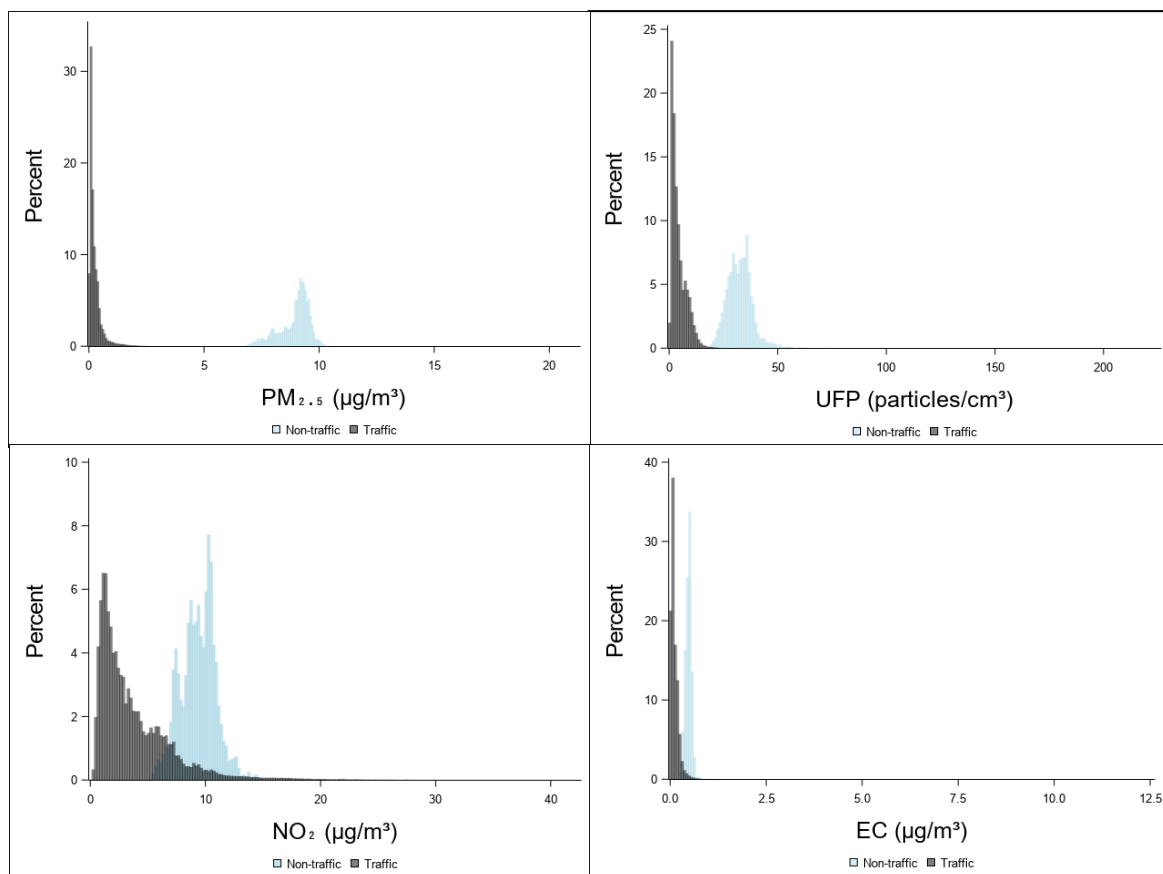

Figure S3. Distribution of PM_{2.5}, UFP, BC and NO₂ concentrations as 5-year average over addresses held 2010 to 2014, by source: Danish road traffic versus other sources.

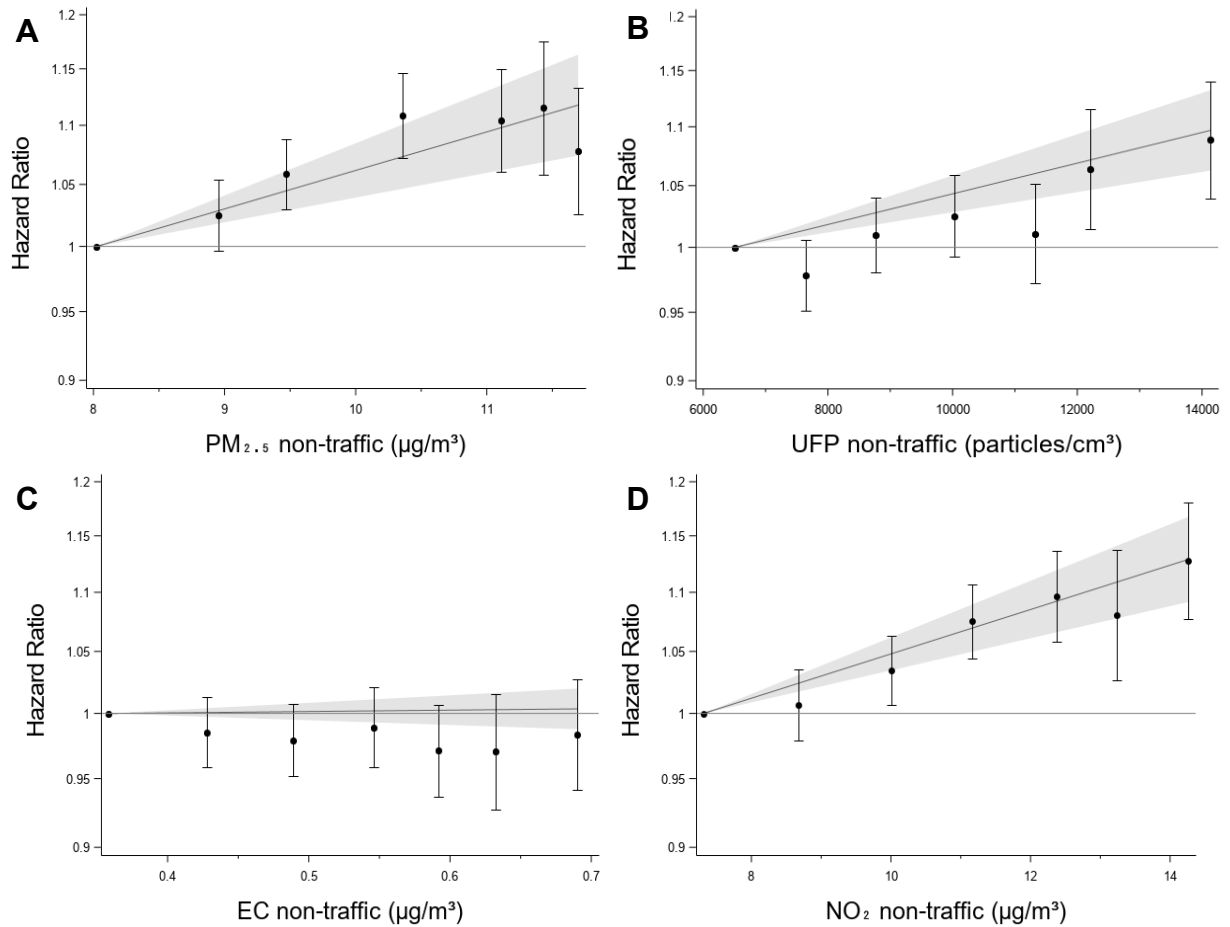

Figure S4 a-d. Associations between MI and 5-year time weighted averages of PM_{2.5} (A), UFP (B), EC (C) and NO₂ (D) from non-traffic sources, specified both in categories and as linear variables in the fully adjusted model 3 (Adjusted for age, sex, calendar period, marital status, education, occupational status, ethnicity, personal and household income and percentage of parish population: living in social housing, being sole providers, of non-western origin, having low income, being unemployed, having blue collar work, having only basic education and having a criminal record) Categories defined from percentiles of exposure: <10% (reference), 10-25%, 25-50%, 50-75%, 75-90%, 90-95% and >95%, HRs and 95% confidence intervals are plotted at the median of each category. The linear estimates from Table 2 with 95% confidence intervals are plotted with the median of the categorical reference category as the null (i.e. =1). (Table S7 holds the same information in tabulated form).

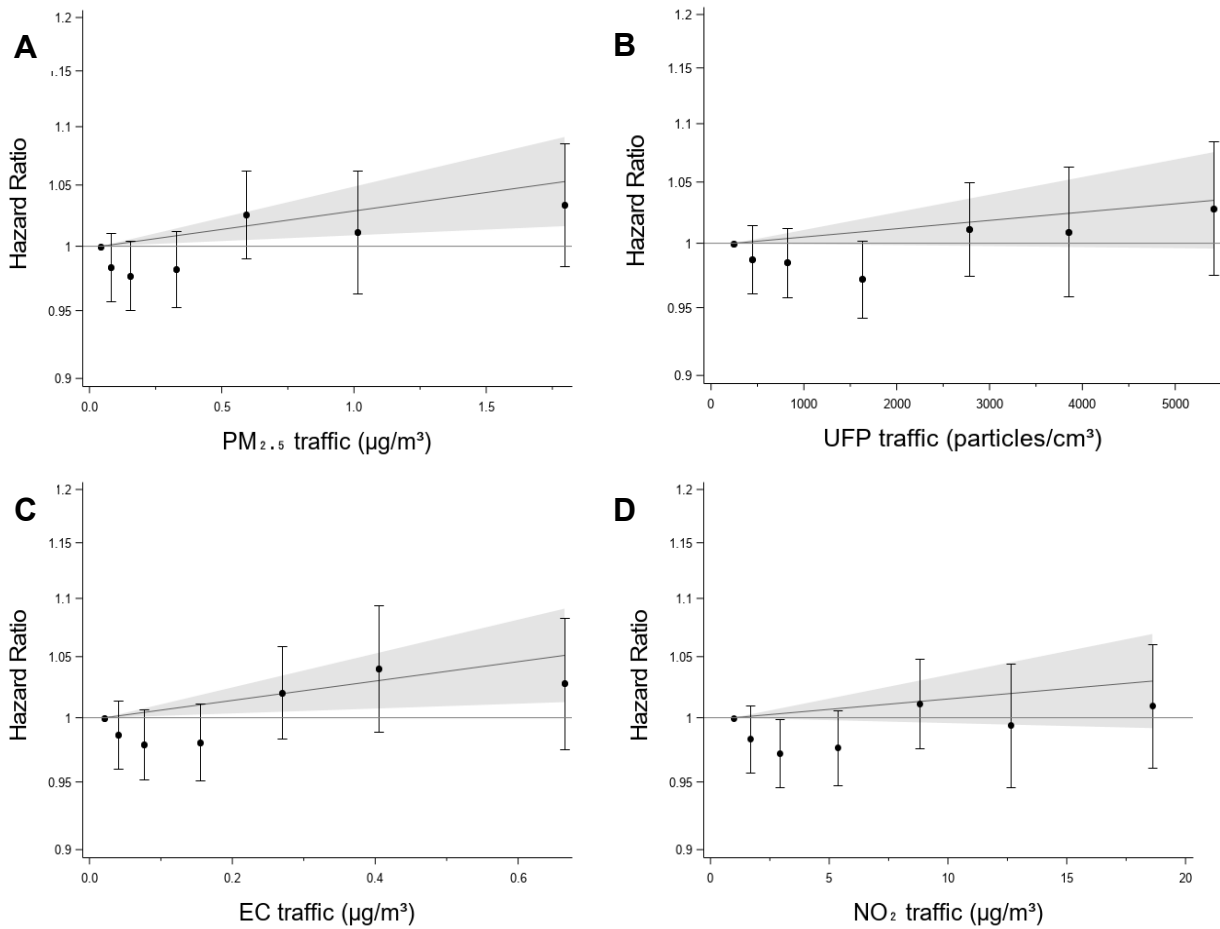

Figure S5 a-d. Associations between MI and 5-year time weighted averages of PM_{2.5} (A), UFP (B), EC (C) and NO₂ (D) from traffic sources, specified both in categories and as linear variables in the fully adjusted model 3 (Adjusted for age, sex, calendar period, marital status, education, occupational status, ethnicity, personal and household income and percentage of parish population: living in social housing, being sole providers, of non-western origin, having low income, being unemployed, having blue collar work, having only basic education and having a criminal record). Categories defined from percentiles of exposure: <10% (reference), 10-25%, 25-50%, 50-75%, 75-90%, 90-95% and >95%, HRs and 95% confidence intervals are plotted at the median of each category. The linear estimates from Table 2 with 95% confidence intervals are plotted with the median of the categorical reference category as the null (i.e. =1). (Table S7 holds the same information in tabulated form).

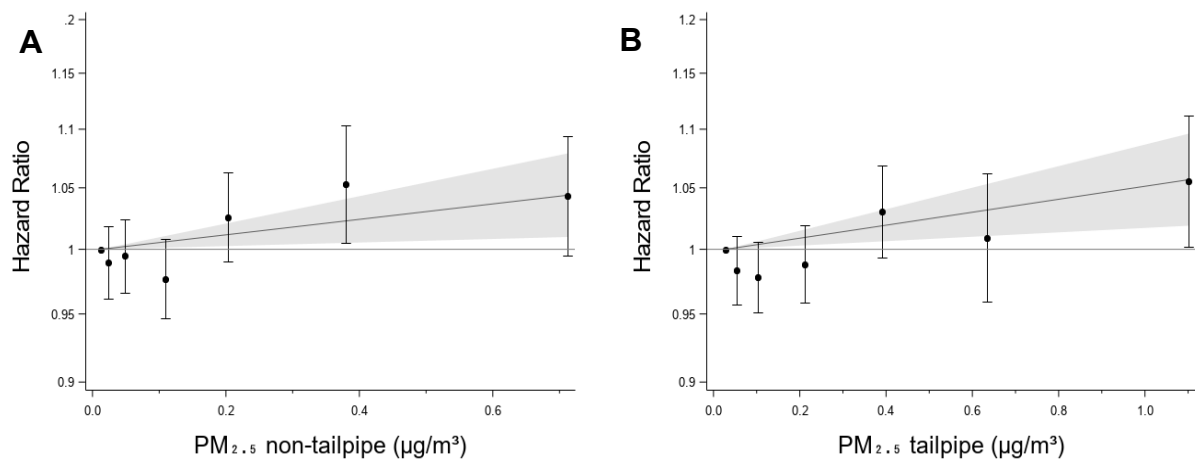

Figure S6 a-b. Associations between MI and 5-year time weighted averages of PM_{2.5} from non-tailpipe (A) and tailpipe sources (B), specified both in categories and as linear variables in the fully adjusted model 3 (Adjusted for age, sex, calendar period, marital status, education, occupational status, ethnicity, personal and household income and percentage of parish population: living in social housing, being sole providers, of non-western origin, having low income, being unemployed, having blue collar work, having only basic education and having a criminal record). Categories defined from percentiles of exposure: <10% (reference), 10-25%, 25-50%, 50-75%, 75-90%, 90-95% and >95%, HRs and 95% confidence intervals are plotted at the median of each category. The linear estimates from Table 2 with 95% confidence intervals are plotted with the median of the categorical reference category as the null (i.e. =1). (Table S8 holds the same information in tabulated form).

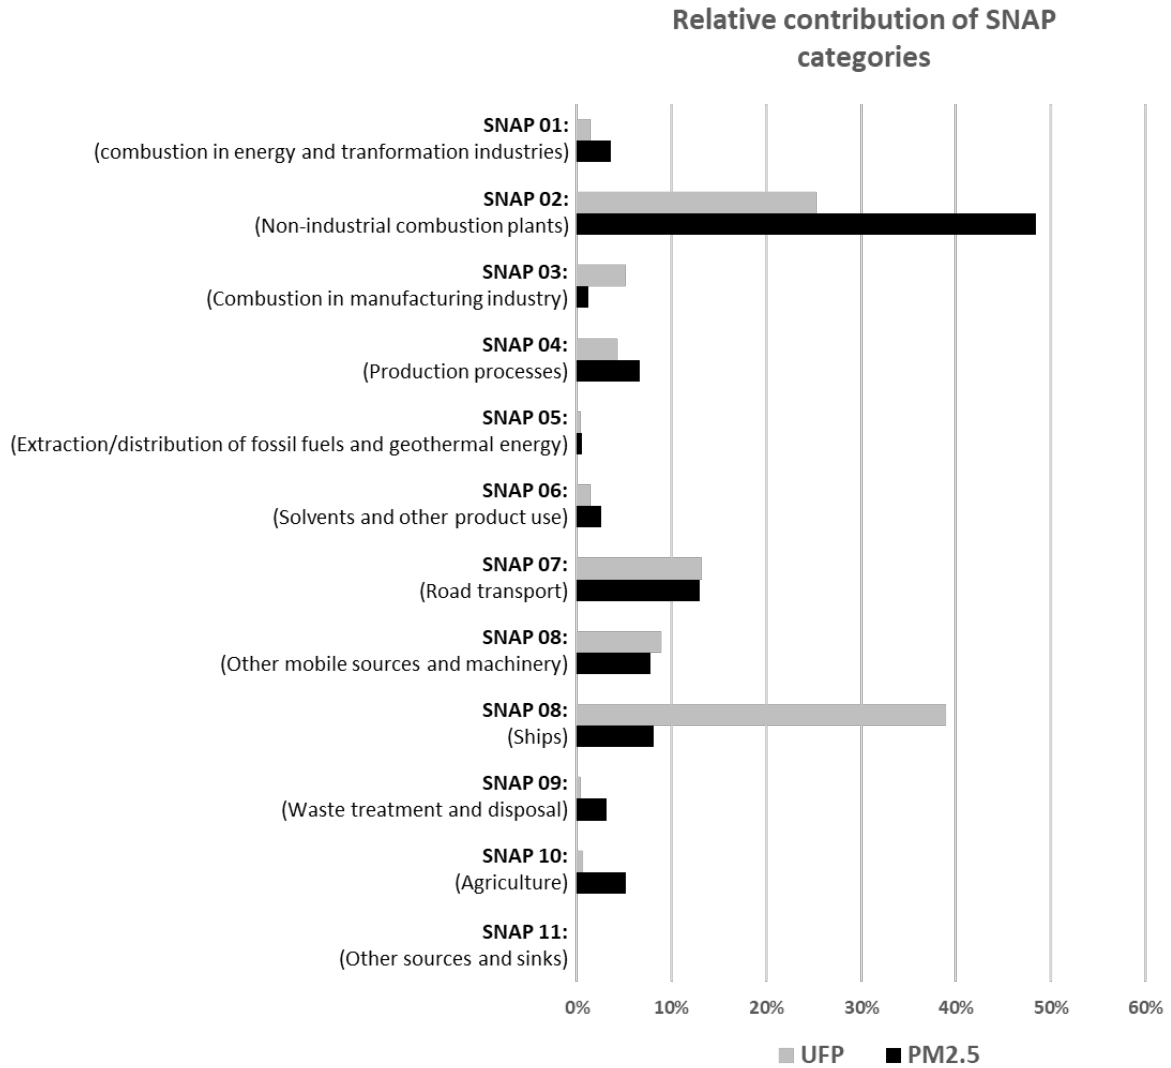

Figure S7. Contributions from different SNAP source categories to Danish air pollution in 2010. Note that contributions from ships have been singled out from SNAP 08: Other mobile sources and machinery.²⁻⁴
