

1 **Supplementary Figures**

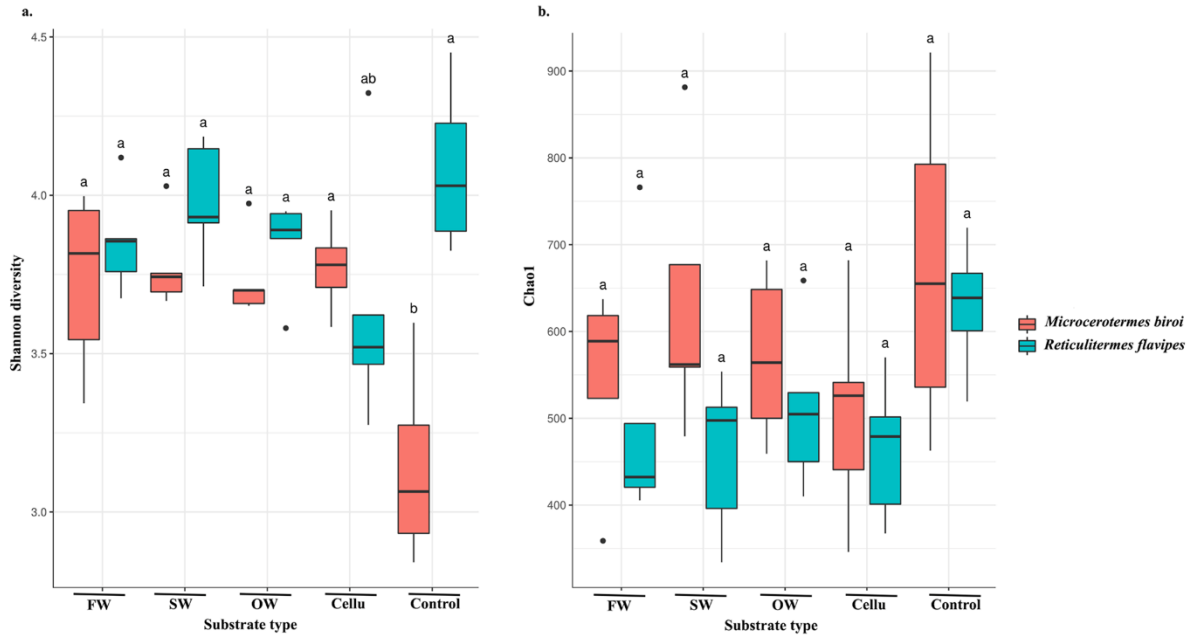

a. Rarefaction curve for bacteria

b. Rarefaction curve for fungi

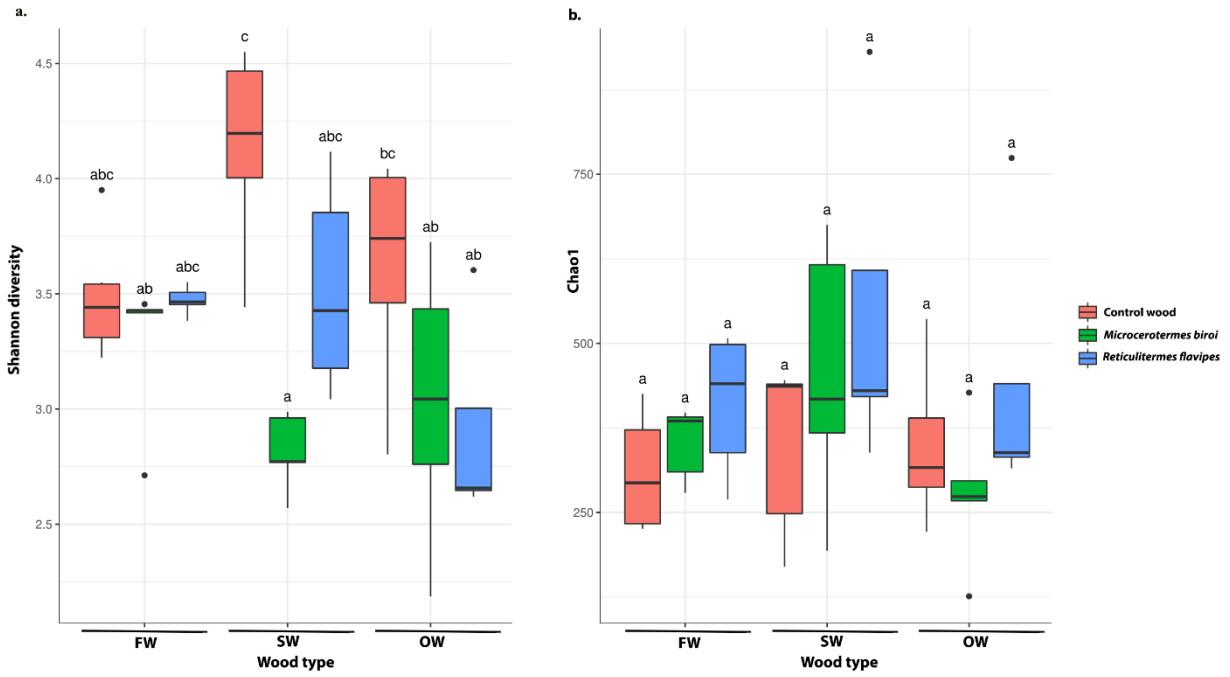

2
3 **Supplementary Figure 1 (a)** Rarefaction curve for bacterial 16S sequences. **(b)** Rarefaction curve
4 for fungal ITS sequences.

5

6 **Supplementary Figure 2. Box plot illustrating the Alpha diversity Indices in termites.**

7 **(a)** The bacterial diversity estimated by Shannon index and **(b)** the community richness determined
 8 by Chao1 analysis within the two termite species feeding on different substrates. The different
 9 alphabets denote significant differences estimated by Tukey HSD *post hoc* test, $p < 0.05$. FW- fresh
 10 wood, SW- standard wood, OW- old wood, Cellu- Cellulose, Control- unfed termites.

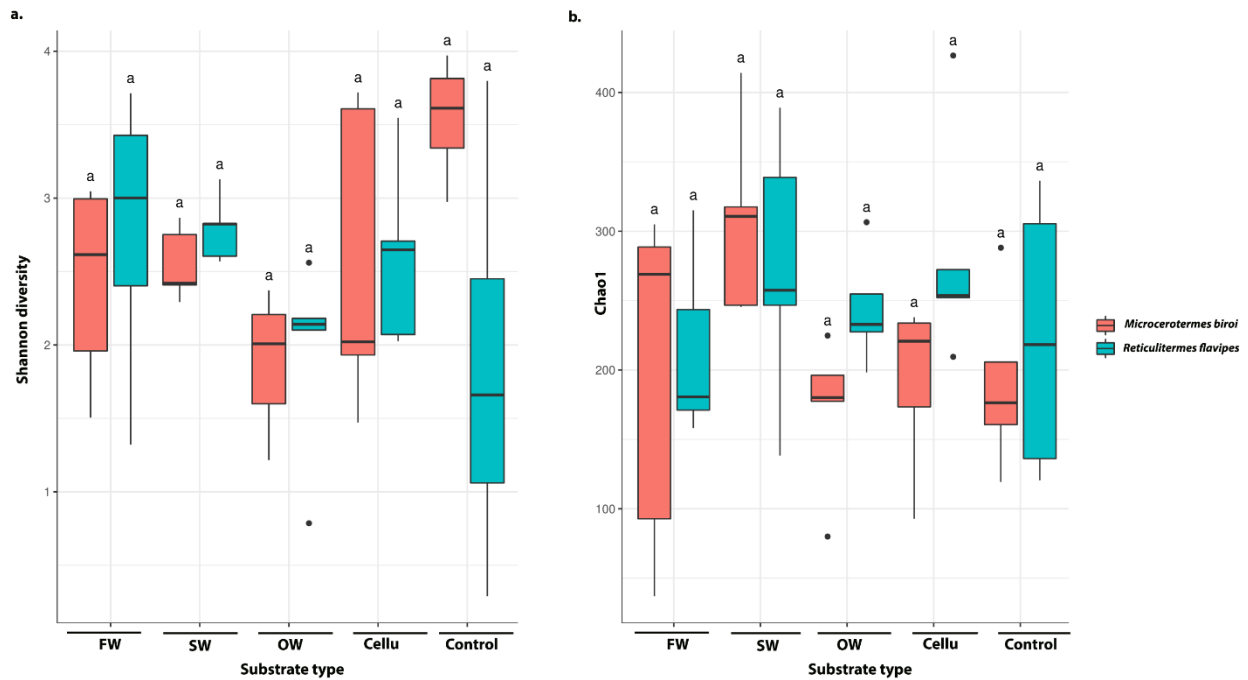

12

13 **Supplementary Figure 3. Box plot illustrating the Alpha diversity Indices in wood.**

14 (a) The bacterial diversity estimated by Shannon index and (b) the community richness determined
 15 by Chao1 analysis within the different wood either infested by termites or uninfested control. The
 16 different alphabets denote significant differences estimated by Tukey HSD *post hoc* test, $p < 0.05$.
 17 FW- fresh wood, SW-standard wood, OW- old wood.

18

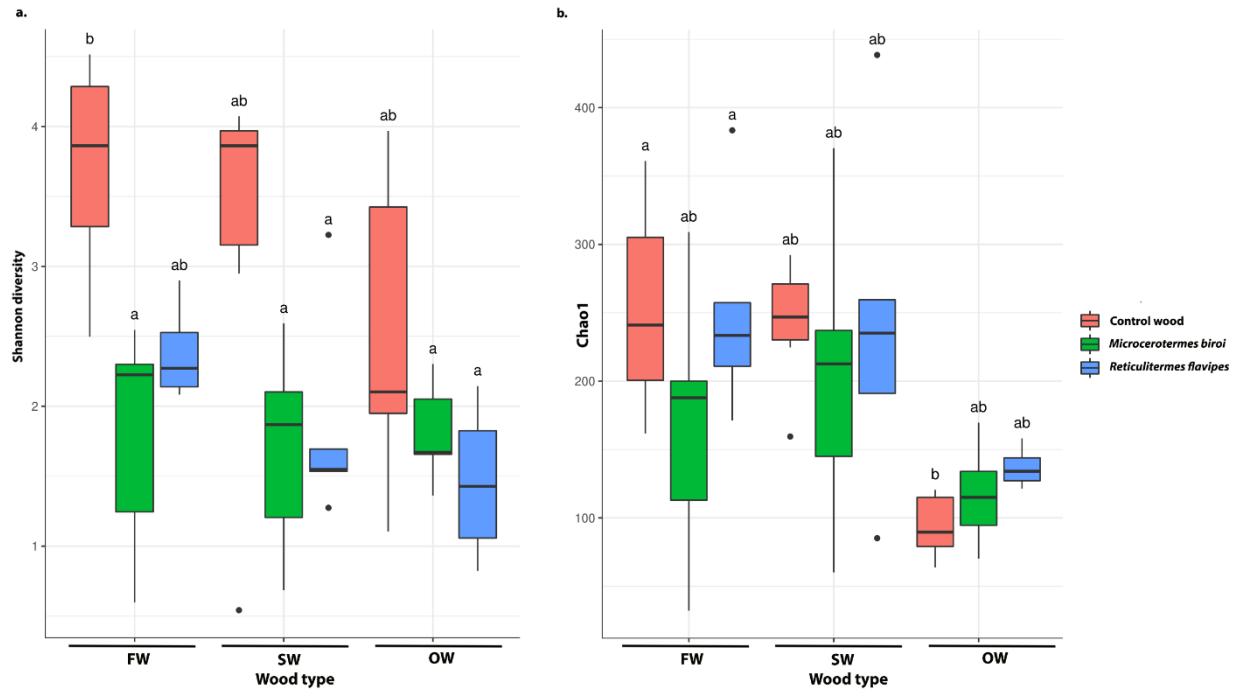

19

20 **Supplementary Figure 4. Box plot illustrating the Alpha diversity Indices in termites.**

21 (a) The fungal diversity estimated by Shannon index and (b) the community richness determined
 22 by Chao1 analysis within the different termite species feeding on different substrates. The different
 23 alphabets denote significant differences estimated by Tukey HSD *post hoc* test, $p < 0.05$. FW- fresh
 24 wood, SW-standard wood, OW- old wood, Cellu- Cellulose, Control- unfed termites.

25

26

27 **Supplementary Figure 5. Box plot illustrating the Alpha diversity Indices in wood.**

28 **(a)** The fungal diversity estimated by Shannon index and **(b)** the community richness determined
 29 by Chao1 analysis within the different wood either infested by termites or uninfested control. The
 30 different alphabets denote significant differences estimated by Tukey HSD *post hoc* test, $p < 0.05$.
 31 FW- fresh wood, SW-standard wood, OW- old wood.

69 **Supplementary Table 5.** The overall Bacterial beta diversity associated with termites and wood samples
 70 based on weighted and unweighted UniFrac distances. Termite species (factor with two levels:
 71 *Microcerotermes biroi* (M) and *Reticulitermes flavipes* (R)), wood type (factor with five levels: fresh wood,
 72 standard wood, old wood, cellulose, and controls), and their interaction (Termite species: wood type). Df
 73 represents degree of freedom, SumsOfSqs denotes sums of squares of deviations, MeanSqs stands for SS/Df,
 74 F. Model represents F-test value. The R2 value illustrates the ratio of grouping variance and total variance.
 75 Pr value determines the significant variation.

76

Bacterial communities in termite bodies (weighted UniFrac)
