

Figure S1. Correlation between MIC values determined by broth microdilution and gradient Etests for 505 non-beta-haemolytic *Streptococcus* invasive strains. MIC values of benzylpenicillin (A), amoxicillin (B), cefotaxime (C) and ceftriaxone (D) were determined for all the isolates by broth microdilution (BMD) using a custom microtiter plate (SWE1SPEC, ThermoFisher) and by gradient Etest and interpreted according to EUCAST recommendations (v 13.0).
