Supplementary Methods

Synthesis of Homogeneous Catalysts. HNG was prepared using the same protocol as heterogeneous catalysts. GO were prepared via a modified Hummers method. GO (100 mg) was dispersed in an aqueous solution of nitric acid (HNO_3 , Sinopharm Chemical Reagents Co., Ltd., GR, 65.0~68.0%). After ultrasonicated for 3 h, the dispersion was centrifuged and the solid phase was cleaned with de-ionized water. To prepare Fe/Fe-HNG (or Cu/Cu-HNG), 25 mg iron chloride hexahydrate ($\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$, Aladdin, 99%) or 16 mg cupric chloride dihydrate ($\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$, Aladdin, AR), and urea (Aladdin, $\geq 99.5\%$, 100 mg) were added in the re-dispersed GO suspension (100 mL, 2 mg L^{-1}) and then ultrasonicated for 2 h. The mixed suspension was stirred for 12 h and then transferred into a Teflon-lined autoclave. After hydrothermally treated at 180°C for 12 h, a porous hydrogel was formed. The hydrogel was washed and freeze-dried. The resultant powder was annealed at 800°C for 2 h at a flowing gas of argon (Ar, Nanjing Special Gas Factory Co., Ltd., 99.999%, 100 sccm) and ammonia (NH_3 , Nanjing Special Gas Factory Co., Ltd., 99.999%, 50 sccm) to yield homogeneous catalysts. In addition, by lowering the Fe (or Cu) precursor down to 18 mg FeCl_3 (or 12 mg CuCl_2), we are able to obtain single-atom dominated Fe-HNG (or Cu-HNG) catalysts.

DEMS Analyses. An aqueous solution of 0.1 M KNO_3 (potassium nitrate, Aladdin, AR, 99.0%) and 1 M KOH (potassium hydroxide, Aladdin, GR, 85%) was flowed into a home-made electrochemical cell by a peristaltic pump. Ar gas was bubbled into the electrolyte constantly before and during the DEMS measurements. Fe/Cu-NG coated glassy carbon, Pt wire, and a saturated calomel electrode were used as the working, counter, and reference electrodes, respectively. LSV test was scanned from 0.1 to -0.6 V vs RHE at a rate of 5 mV s^{-1} after the baseline was steady. The mass signals were collected in the process of LSV test. After the end of electrochemical test, waiting for the mass signal to return to baseline, the next cycle started using the same test conditions to minimize errors.

Detection of NO_3^- . The concentration of NO_3^- was determined at different voltages using the ultraviolet-visible (UV-Vis) spectrophotometry. Each voltage was hold for 0.5 h in 1 M KOH and 0.1 M KNO_3 before nitrogen quantification. After that, 1.0 mL electrolyte was removed out of the electrolytic cell and diluted to 5 mL. 0.1 mL HCl (1 M) and 0.01 mL sulfamic acid (Shanghai Macklin Biochemical Technology Co., Ltd., AR, 99.5%, 0.8 wt%) were further added in the solution. After 15 minutes, the UV-vis absorption spectra were recorded with a Shimadzu UV-3600 plus spectrophotometer. The total absorbance of NO_3^- was calculated by the following equation: $A=A_{220}-2*A_{275}$ (where A_{220} and A_{275} are the absorbance coefficients at 220 nm and 275 nm, respectively)¹. The standard curve can be made by measuring the UV-vis spectra of varied concentrations of KNO_3 solutions.

Detection of NO_2^- . The nitrite concentration was measured by UV-vis spectrophotometry according to the standard method. Firstly, the colour reagent was prepared by mixing sulfonamide (Shanghai Macklin Biochemical Technology Co., Ltd., AR, 99.5%, 4 g), *N*-(1-naphthyl) ethylenediamine dihydrochloride (Shanghai Macklin Biochemical Technology Co., Ltd., >98%, 0.2 g), phosphoric acid (H_3PO_4 , Sinopharm Chemical Reagents Co., Ltd., GR, $\geq 85.0\%$, 10 mL, $\rho=1.685 \text{ g mL}^{-1}$), and deionized water (50 ml). The electrolyte sample should be diluted to the detection range. Then 0.1 mL of the colour reagent was mixed with 5 mL of the sample solution and rested for 20 min at room condition. The absorption intensity at a wavelength of 540 nm was recorded by UV-Vis absorption spectrum. The concentration-absorbance curve was linear fitted using a series of standard KNO_2 (potassium nitrite, Aladdin, AR, 97%) solutions by the same processes. The concentration of NO_2^- product was calculated based on the calibrated curve.

Determination of NH₃. NH₃ was determined by the indophenol blue method according to previous report^{2,3}. The electrolyte (1 mL) was transferred into a 5 mL clean vessel. The following solutions, 1 mL NaOH solution (sodium hydroxide, Aladdin, AR, 96%, 1 M) containing salicylic acid (Shanghai Macklin Biochemical Technology Co., Ltd., AR, 99.5%, 5 wt%) and sodium citrate dihydrate (Shanghai Macklin Biochemical Technology Co., Ltd., 99.0%, 5 wt%), 0.5 mL NaClO (sodium hypochlorite solution, Shanghai Macklin Biochemical Technology Co., Ltd., 6~14% active chlorine basis, 0.05 M), and 0.1 mL Na₂[Fe(NO)(CN)₅] (sodium nitroferricyanide(III) dihydrate, Shanghai Macklin Biochemical Technology Co., Ltd., AR, 99.0%, 1 wt%), were added to the vessel sequentially. After 2 h incubation, the UV-vis spectra of the resultant solution were measured from 500 nm to 800 nm. The absorption peak at 655 nm was originated from the formation of indophenol blue. To quantify NH₃ accurately, the concentration-absorbance curve was made by measure a series of standard ammonia chloride (NH₄Cl, Aladdin, GR, 99.8%) with varied concentrations in 0.1 M KOH. The absorbance spectra of a blank sample without NH₃ was subtracted from the measured absorbance of all tested samples for background correction.

¹⁵N isotope-labelling experiments by ¹H NMR. ¹H NMR spectroscopy (500 MHz) was used to quantify the ¹⁵NH₄⁺/¹⁴NH₄⁺ yield after electrolysis at -0.3 V (vs RHE). The calibration curves with defined ¹⁵NH₄Cl (ammonium chloride-¹⁵N, Shanghai Macklin Biochemical Technology Co., Ltd., isotopic abundance: 99 atom%, ≥98.5%) concentrations were constructed as standards. In a typical procedure, 125 μl of the standard solution/electrolytes was first diluted to the detection range and adjust to pH 2.0 by adding 0.1 M HCl. Next, the solution was mixed with 0.1 ml DMSO-*d*6 (hexadeuterodimethyl sulfoxide, Shanghai Macklin Biochemical Technology Co., Ltd., D. 99.9%) (include 0.04 wt% C₄H₄O₄), where DMSO-*d*6 serves as a solvent and C₄H₄O₄ (Maleic acid, Shanghai Macklin Biochemical Technology Co., Ltd., AR, ≥99.0%) as the internal standard. Finally, the prepared solution was tested by a 500MHz NMR spectrometer. The NH₃ product peaks area integral ratio to maleic acid were analyzed to confirm the source of NH₃ qualitatively.

Faradaic efficiency and yield of NH₃. The faradaic efficiency (FE) of NH₃ production was determined by the following equation:

$$FE(NH_3) = (8 \times F \times C_{NH_3} \times V \times 10^{-16}) / (17 \times Q) \times 100\% \quad (1)$$

Where F is Faraday constant (96485 C mol⁻¹), C_{NH₃} is the concentration of NH₃ (μg mL⁻¹) in the electrolyte, V is the volume of the electrolyte, Q is the charge consumed for NH₃ generation.

The yield rate (YR, mg_{NH₃} h⁻¹ cm⁻²) of NH₃ can be calculated using the following equation:

$$YR(NH_3) = (C_{NH_3} \times V) / (t \times A) \times 10^{-3} \quad (2)$$

Where t is the electrolysis time; A is the geometric area of the electrode (1 cm⁻²).

Energy consumption of NH₃ production. Assuming the overpotential of anodic electrode (the water oxidation) is zero, the half-cell energy efficiency (EE) defined as the ratio of chemical energy to applied electrical power was calculated with the following equation:

$$EE(NH_3) = (1.23 - E_{NH_3}^0) \times FE(NH_3) / (1.23 - E) \times 100\% \quad (3)$$

where E_{NH₃}⁰ is the equilibrium potential (0.69 V) of nitrate electroreduction to ammonia in alkaline media; FE(NH₃) is the faradaic efficiency for NH₃; 1.23 V is the equilibrium potential of water oxidation (i.e. assuming the overpotential of the water oxidation is zero); E is the applied potential (vs. RHE) for NH₃ production. Energy consumption (EC, Wh g_{NH₃}⁻¹) was calculated by $EC = \frac{P \cdot t}{m} = \frac{UI \cdot t}{m}$, where U is the voltage (V vs RHE), I is the current density (mA cm⁻² or mA mg⁻¹), t is the time (h), m is the mass of NH₃ (g).

Electrochemical measurements. Electrochemical properties were measured by a VSP Potentiostat (Bio-Logic Corp., France) in an H-type cell, which has a Nafion membrane (N-117, Dupont) to separate the cathode and anode chambers. Platinum foil and Hg/HgO (1.0 M KOH) were used as the counter and reference electrodes, respectively. The working electrode was prepared using the following procedure. Catalyst powder (4.0 mg), deionized water (1.0 mL), ethanol (1.0 mL), and Nafion solution (Sigma Aldrich, 5 wt%, 50.00 μL) were mixed and sonicated for at least 30 min to form a homogeneous ink. Catalyst ink was drop-casted onto carbon paper (active area: $1 \times 1 \text{ cm}^{-2}$) with a mass loading of 0.240 mg cm^{-2} . The potentials were converted to the reversible hydrogen electrode (RHE) *via* the following equation:

$$E_{(RHE)} = E_{(Hg/HgO)} + 0.059 * pH + 0.098 V \quad (4)$$

NO_3^- was electrochemically reduced within an electrolyte of 1.0 M KOH and 0.10 M KNO_3 , which was first degassed by an ultrapure Ar gas to remove O_2 and N_2 . LSV curves were measured at a rate of 5 mV s^{-1} from 0.2 to -0.7 V (vs RHE). Chronopotentiometric tests were carried out at varied potentials to evaluate the faradaic efficiency and yield rate of NH_3 . For consecutive recycling tests, the chronopotentiometric tests were performed at -0.3 V (vs RHE) for a prolonged time under stirring. After electrolysis, the electrolyte was analyzed by UV–Vis spectrophotometry.

DFT calculation. The first-principle calculations were performed using the Vienna Ab initio Simulation Package (VASP) code^{4,5}. Perdew-Burke-Ernzerhof (PBE) functional within a generalized gradient approximation (GGA) was used to treat the exchange-correlation energy⁶. To describe the expansion of the electronic eigenfunctions, the projector-augmented wave (PAW) method was applied with a kinetic energy cutoff of 500 eV. a $3 \times 3 \times 1$ supercell was built for graphene. For structural optimizations, a Γ centered $4 \times 4 \times 1$ Monkhorst-Pack k-point sampling was used in the first Brillouin zone, whereas k-point mesh was increased to $8 \times 8 \times 1$ for the density of states (DOS) calculations. All atomic positions were fully relaxed until energy and force reached the tolerance of $1 \times 10^{-5} \text{ eV}$ and 0.02 eV \AA^{-1} , respectively.

The vacuum thickness was set to be 15 Å to minimize interlayer interactions. The solvation effect was not included since the ignorable energy change was witnessed. VASPKIT was adopted to obtain the DOS diagrams⁷. Wannier orbitals were calculated using a wannier90 code⁸.

Electrochemical nitrate reduction pathway. Based on computational hydrogen electrode (CHE) model⁹, the Gibbs free energy (ΔG) calculations of each elementary step can be determined as:

$$\Delta G = \Delta E + \Delta E_{ZPE} - T\Delta S + \Delta U + \Delta pH \quad (5)$$

where ΔE is the energy obtained from DFT calculations. ΔE_{ZPE} and ΔS are the correction of zero-point energy and entropy, respectively. T is temperature (298.15 K). ΔU and ΔpH represent the effect of voltage and pH, respectively.

To avoid calculate the free energy of charged NO_3^- directly, gaseous HNO_3 is chosen as a reference instead¹⁰. Following the method of previous report, the adsorption energy of NO_3^- ($\Delta G_{\text{NO}_3}^*$) could be determined by:

$$\Delta G_{\text{NO}_3}^* = G_{\text{NO}_3}^* - G^* - G_{\text{HNO}_3(\text{g})} + 1/2G_{\text{H}_2(\text{g})} + G_{\text{correct}} \quad (6)$$

where $G_{\text{NO}_3}^*$, G^* , $G_{\text{HNO}_3(\text{g})}$, and $G_{\text{H}_2(\text{g})}$ are the Gibbs free energy of NO_3 adsorbed on substrate, HNO_3 , and H_2 molecules in the gas phase, respectively. $\Delta G_{\text{correct}}$ denotes the correction of adsorption energy and is set to 0.392 eV. Electrochemical reduction from nitrate to NH_3 involves nine protons and eight electrons. The whole reaction can be summarized as:

The elementary steps of reduction pathway on catalyst were simulated according to the following reactions:

where * represents the adsorption site.

Supplementary Figures

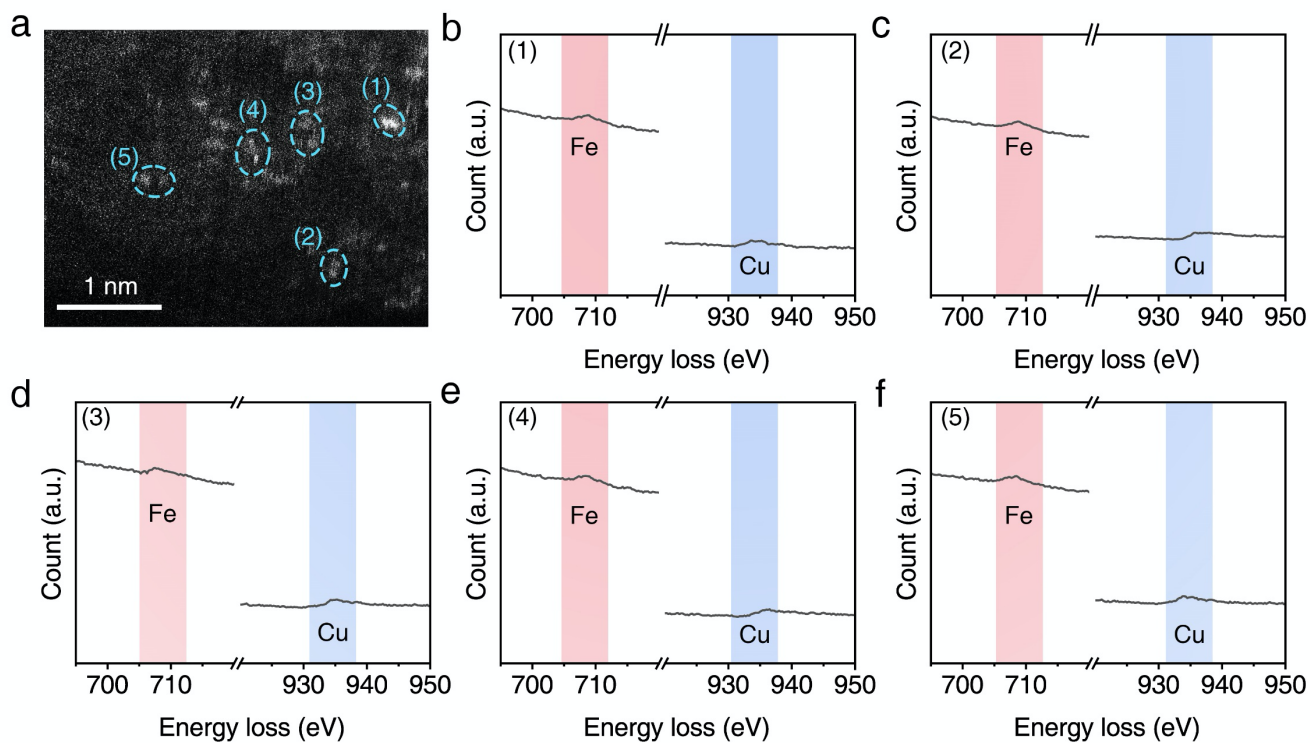

Supplementary Fig. 1 SEM images of (a, b) rGO and (c, d) HNG indicate that HNG has an interconnected vesicle-like structure.

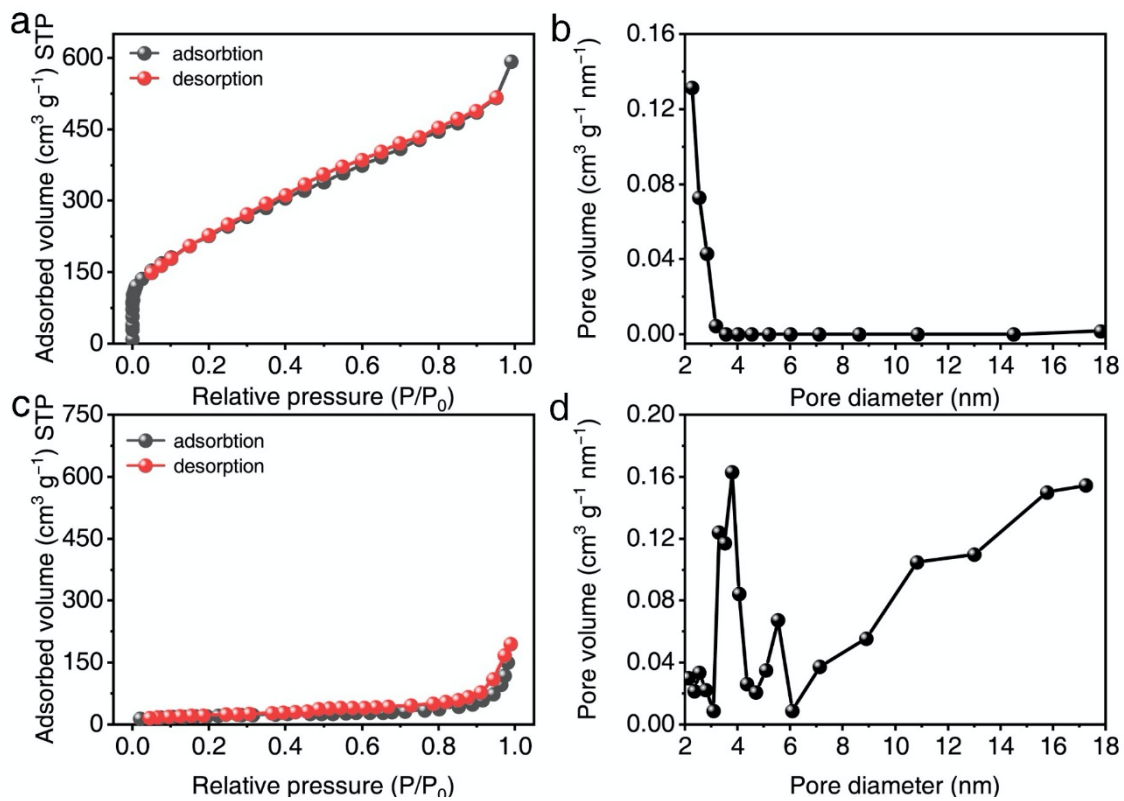

Supplementary Fig. 2 TEM images of (a) rGO and (b) HNG.

Supplementary Fig. 3 (a) HAADF-STEM image of Fe/Cu-HNG, (b) Magnified HAADF-STEM image of the red rectangular area. (c) Intensity profiles of the single atom site in b. (d) Magnified HAADF-STEM image of the orange rectangular area. (e) Intensity profiles of the diatomic pair in d. (f) Statistical distribution analysis of single-atoms, dimmers, and trimmers in Fe/Cu-HNG. The HAADF-STEM images shows dimer combination. However, there still exists a possibility that two adjacent atoms in two stacking graphene layers are imaged and mistaken as diatomic sites. Therefore, a single layer of holey graphene (see Supplementary Fig. 7) should be chosen to take the HAADF-STEM images in order to avoid the overlay imaging of two isolated single atoms. The XRD pattern in Fig. 2i shows a peak around 25.8° , which corresponds to the interlayer distance of 3.47 \AA between multi-layer graphene. The EXAFS fitting data show the second shell peak (metal-metal path) around 2.25 \AA , which excludes the possibility of dual atoms in the different layers. By analyzing the STEM images, the percentage of diatomic pairs accounted for $\sim 75.43\%$.

Supplementary Fig. 4 (a) HAADF-STEM image and (b-f) corresponding EEL spectra taken at the different sites. The Fe and Cu signals in the EELS spectra affirmatively indicates the dual Fe-Cu sites in Fe/Cu-HNG.

Supplementary Fig. 5 N₂ adsorption-desorption isotherms and the pore-size distribution of (a, b) HNG and (c, d) rGO.

Supplementary Fig. 6 XRD patterns of HNG. Two peaks at $\sim 26^\circ$ and 43° are attributed to the (002) and (101) planes of graphitic carbon. As compared to Fig. 2i, it could be concluded that no crystalline impurities are observed after loading Fe/Cu.

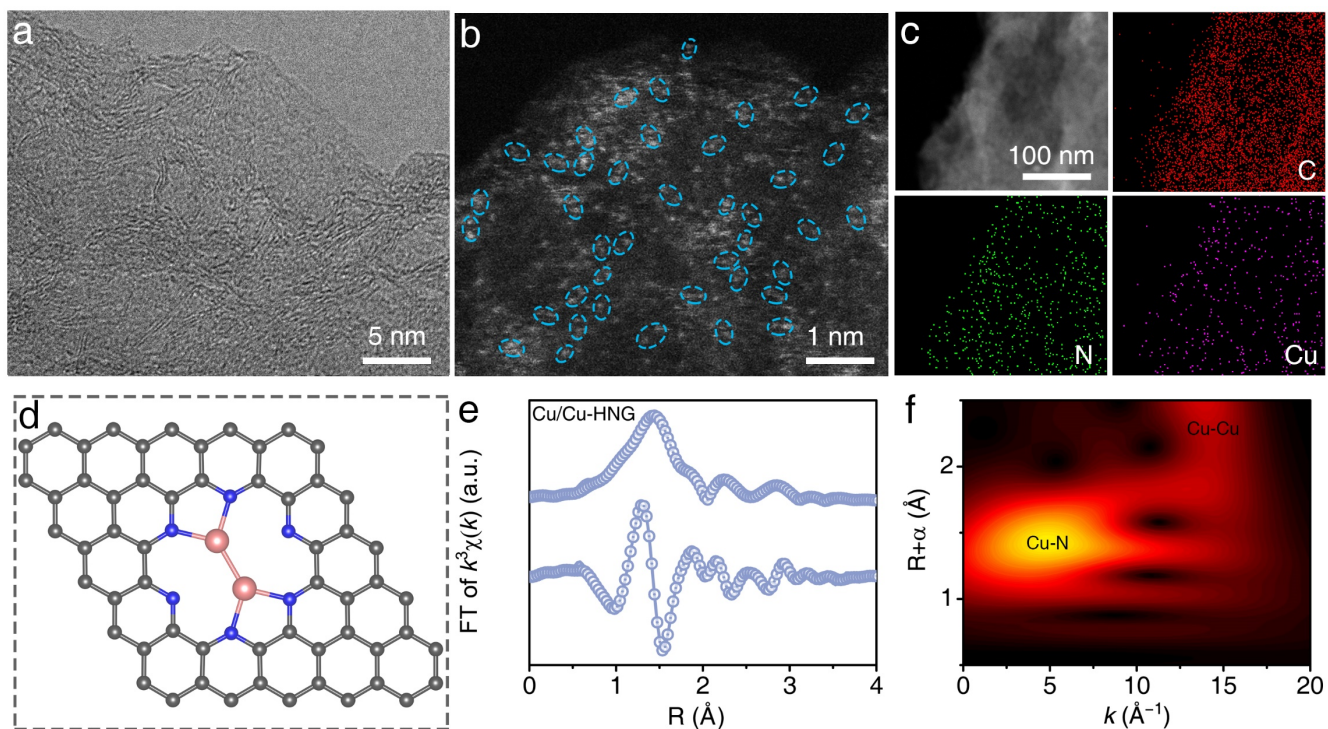

Supplementary Fig. 7 (a) SEM and (b) EDS mapping images of Fe/Cu-HNG indicate the existence of Fe, Cu, N, and C elements throughout the graphene layer.

Supplementary Fig. 8 (a) TEM and (b) HRTEM images of Fe/Cu-HNG show randomly orientated graphitic layers without obvious metal particles.

Supplementary Fig. 9 (a) HRTEM and (b) HADDF-STEM images of Fe/Fe-HNG show randomly orientated graphitic layers without obvious metal nanoparticles. Supplementary Fig. 21 (a) Chronoamperometry curve of Fe/Cu-HNG at -0.3 V (vs RHE) for 4 h. (b) UV-vis testing curves of Fe/Cu-HNG after different electrolysis times.

Supplementary Fig. 22 NH_3 FE of Fe-HNG at varied potentials.

Supplementary Fig. 23 NH_3 FE of Cu-HNG at varied potentials.

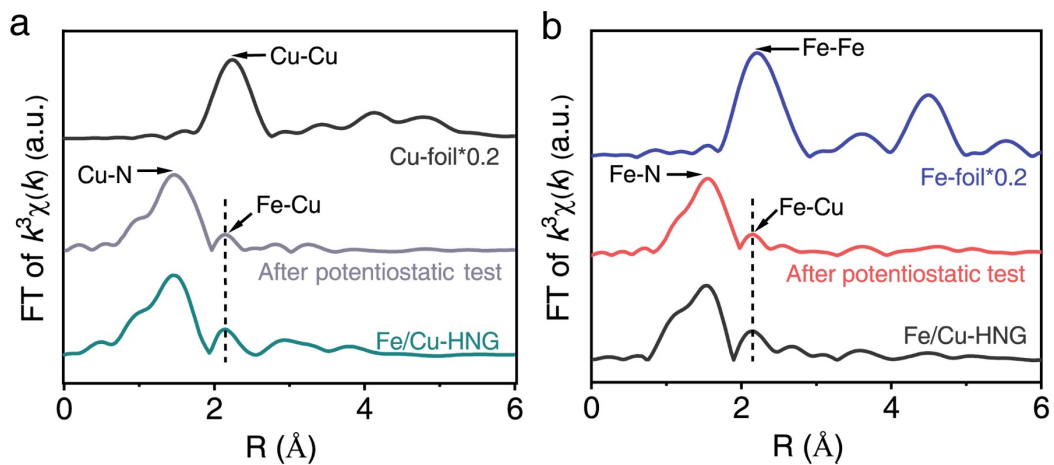

Supplementary Fig. 24 Detection and quantification of $^{15}\text{NH}_4^+$ and $^{14}\text{NH}_4^+$ by ^1H NMR spectra. (a) ^1H NMR spectra of $^{15}\text{NH}_4^+$ ions at different concentrations. $C_4H_4O_4$ with a constant concentration was used as an external standard (with the proton signal at $\delta = 6.25$ ppm). (b) Calibration curve for $^{15}\text{NH}_4^+$ detection using ^1H NMR, where $^{15}\text{NH}_4^+$ peak area integrals were normalized to that of $C_4H_4O_4$. The normalized peak area integral of $^{15}\text{NH}_4^+$ is positively correlated to the concentrations of $^{15}\text{NH}_4^+$. (c) Comparison of the ammonia yield rate over Fe/Cu-HNG quantified by the ^1H NMR and UV-vis spectra.

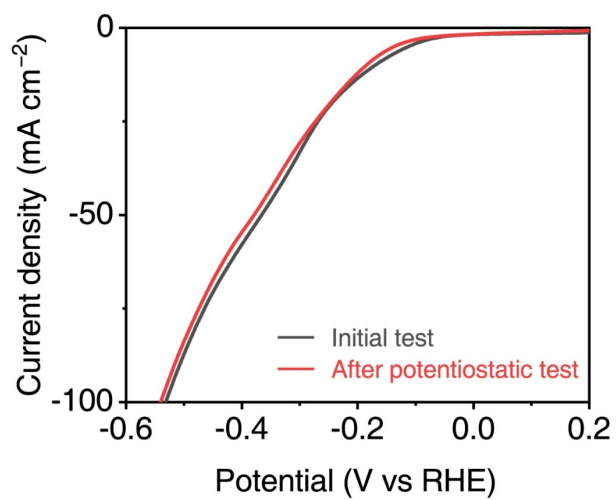

Supplementary Fig. 25 FEs of NH₃, NO₂⁻, and H₂ generated by Fe/Cu-HNG at varied potentials. Given that their total efficiencies were maintained around 98~99%, only NH₃, NO₂⁻, and H₂ were measured.

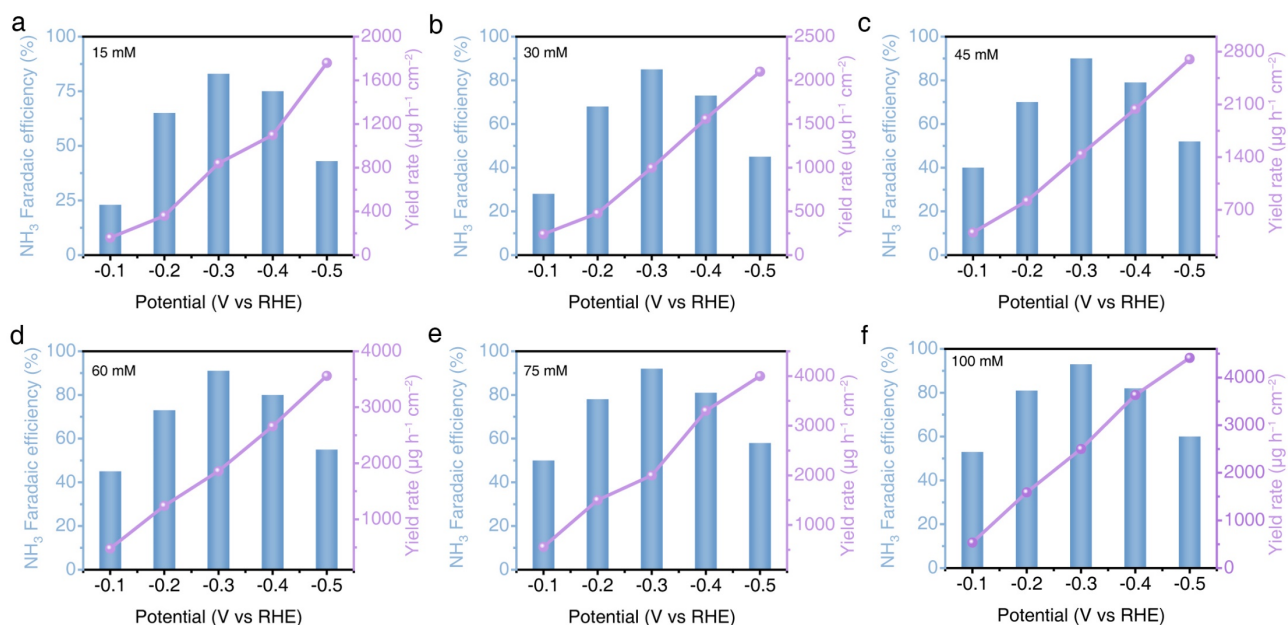

Supplementary Fig. 26 (a) TEM, (b) HRTEM, (c) HAADF-STEM, and (d) Zoomed-in HAADF-STEM (dual-atoms sites were marked with green dashed circles) images of Fe/Cu-HNG after 24 h test.

Supplementary Fig. 27 The k^3 -weighted FT of $\chi(k)$ -function from (a) the Cu K-edge EXAFS and (b) the Fe K-edge EXAFS of Fe/Cu-HNG after 24 h test.

Supplementary Fig. 28 LSV curves of the initial and after 24 h test of Fe/Cu-HNG.

Supplementary Fig. 29 (a-f) The NH₃ yield rates and FEs of Fe/Cu-HNG at different nitrate concentrations. The catalytic performance of Fe/Cu-HNG was examined at different NO₃⁻ concentrations range from 15 mM to 100 mM because the wide concentration range of various nitrate concentrations may exist in different water sources. The maximal FEs of NO₃⁻ to NH₃ in the tested concentration range were 83~93% at -0.3 V (vs RHE), respectively. The low YEs in the low nitrate concentration solution result from the low diffusion flux of nitrate from the electrolyte to the catalyst surface. Furthermore, the FEs decreased dramatically at the more negative potential owing to the competitive HER. In general, the catalyst presented the appreciable ammonia yield rates and high appreciable selectivity under different nitrate concentrations, demonstrating the high activity of Fe/Cu-HNG.

Supplementary Fig. 30 The schematic illustration of customized electrochemically cell.

Supplementary Fig. 31 Full reaction paths for NO_3^- reduction reaction.

Supplementary Fig. 32 (a, b) The crystallographic model and atomic arrangement for Fe/Cu-HNG.

After optimization, the distance between two adjacent Fe and Cu atoms is around 2.26 Å, which is close to the observed separation from the STEM image in Fig. 2c.

In the local structure of $\text{N}_2\text{Fe-CuN}_2$, each metal atom is triply coordinated with two nitrogen atoms and one metal (similar to a Y-type ML_3 coordination). The 4sp^2 hybrid orbitals of Fe form three in-plane σ bonds. The Fe $3d_{xy}$ orbital with some $4p_x$ mixing and $3d_{x^2-y^2}$ orbital with some $4p_y$ mixing could also contribute to the bonding interaction with 2 N and Cu while the Fe $3d_{z^2}$ orbital remains weakly bonding with them. The Fe $3d_{yz}$ and $3d_{xz}$ orbitals weakly bond with 2 N $2p_z$, and may also form weak d-d π and d-d δ interactions with Cu, respectively.

Supplementary Fig. 33 The structure of (a) Fe single atom and (b) Cu single atom with NO₃^{*} adsorption on the metal atom sites.

Supplementary Fig. 34 The bond length distribution of different Metal site-O on Fe/Cu, Fe/Fe and Cu/Cu diatomic sites, respectively.

Supplementary Fig. 35 Free energy diagram of each intermediate state on the metal atom sites in Fe-Cu, Fe-Fe and Cu-Cu diatomic sites at $U=0$ V vs. RHE.

Supplementary Fig. 36 Free energy diagram of each intermediate state in Fe-Cu, Fe-Fe and Cu-Cu diatomic sites at $U = 0.69 \text{ V}$ vs. RHE.

Supplementary Tables

Table 1. Elemental composition for the catalysts.

Sample	Iron (wt.%)	Copper (wt.%)
Fe/Cu-HNG	3.3	2.8
Fe-HNG	6.3	
Cu-HNG		5.9

Table 2. EXAFS structure parameters from the different samples.

Sample	K-edge	Shell	N	$r/\text{\AA}$	$\sigma^2/10^{-3}\text{\AA}^2$	R
Fe/Cu-HNG	Fe	Fe-Cu	0.87	2.26 ± 0.083	2.87 ± 0.35	0.003
		Fe-N	2.15	2.01 ± 0.041	4.32 ± 0.61	
	Cu	Fe-Cu	0.86	2.24 ± 0.036	3.14 ± 0.34	0.002
		Cu-N	2.33	2.05 ± 0.026	2.66 ± 0.43	
Fe-HNG	Fe	Fe-N	1.92	1.74 ± 0.028	3.85 ± 0.27	0.005
Cu-HNG	Cu	Cu-N	1.95	1.92 ± 0.013	6.50 ± 0.33	0.002
Fe/Fe-HNG	Fe	Fe-Fe	0.87	2.17 ± 0.017	5.24 ± 0.16	0.006
		Fe-N	2.13	1.89 ± 0.024	5.17 ± 0.30	
Cu/Cu-HNG	Cu	Cu-Cu	0.89	2.31 ± 0.034	3.90 ± 0.37	0.003
		Cu-N	2.10	1.95 ± 0.018	1.96 ± 0.15	
Fe-foil	Fe	Fe-Fe	8	2.45 ± 0.012	3.89 ± 0.16	0.003
Cu-foil	Cu	Cu-Cu	12	2.54 ± 0.022	8.30 ± 0.48	0.004

 N : coordination number; r : bond length; σ^2 : Debye-Waller factor (disorder); R : R-factor.

Table 3. Reported catalysts for the nitrate reduction to ammonia.

Materials	Maximum FE to NH ₃	Corresponding potential to NH ₃	Maximum NH ₃ yield rate ^a	Maximum energy consumption	Electrolyte conditions	Ref
Fe/Cu-NG	~92.51 %	-0.3 V vs RHE	1.08 mmol h ⁻¹ mg ⁻¹ -0.5 V vs RHE	8.76 Wh g _{NH₃} ⁻¹ mg ⁻¹	0.10 M KNO ₃ , 1.0 M KOH, pH=14	This work
Fe single atom	~75%	-0.66 V vs RHE	0.46 mmol h ⁻¹ cm ⁻² ~20 mg h ⁻¹ mg _{cat.} ⁻¹ -0.85 V vs RHE	26.60 Wh g _{NH₃} ⁻¹ cm ⁻²	0.50 M KNO ₃ , 0.10 M K ₂ SO ₄ , pH=7	2
Cu-PTCDA	85.9%	-0.4 V vs RHE	0.05 mmol h ⁻¹ cm ⁻² -0.6 V vs RHE	53.83 Wh g _{NH₃} ⁻¹ cm ⁻²	36 mM NO ₃ ⁻ , 0.1 mM PBS, pH=7	3
Single-site iron	~100%	After -0.3V vs RHE	0.16 mmol h ⁻¹ cm ⁻² -0.7 V vs RHE	28.37 Wh g _{NH₃} ⁻¹ cm ⁻²	0.1 M KNO ₃ , 0.1 M KOH, pH=13	11
defective CuO	89%	-0.5 V vs RHE	0.33 mmol h ⁻¹ cm ⁻² -0.7 V vs RHE	68.00 Wh g _{NH₃} ⁻¹ cm ⁻²	0.05 M KNO ₃ , 0.05 M H ₂ SO ₄ , pH=1	12
Cu ₄₉ Fe ₁	94.5%	-0.74 V vs RHE	0.23 mmol h ⁻¹ cm ⁻² -0.74 V vs. RHE	28.01 Wh g _{NH₃} ⁻¹ cm ⁻²	200 ppm KNO ₃ , 0.1 M K ₂ SO ₄ , pH=7	13
Fe-cyano NSs	90%	-0.5 V vs RHE	42.1 mg h ⁻¹ mg _{cat.} ⁻¹ -0.5V vs RHE	12.32 Wh g _{NH₃} ⁻¹ mg _{cat.} ⁻¹	0.10 M KNO ₃ , 1.0 M KOH, pH=14	14
Cu/Cu ₂ O	95.8%	-0.85 V vs RHE	0.245 mmol h ⁻¹ cm ⁻² -0.85 V vs RHE	64.92 Wh g _{NH₃} ⁻¹ cm ⁻²	14.3 mM NO ₃ ⁻ , 0.5 M NaSO ₄ , pH=7	15
TiO _{2-x}	85%	-1.6 V vs SCE	0.765 mg h ⁻¹ mg _{cat.} ⁻¹ -1.6 V vs SCE	31.41 Wh g _{NH₃} ⁻¹ mg _{cat.} ⁻¹	3.6 mM NO ₃ ⁻ , 0.5 M NaSO ₄ , pH=7	16
Co/CoO NSAs	93.8%	-1.3 V vs SCE	0.19 mmol h ⁻¹ cm ⁻² -1.3 V vs SCE	31.94 Wh g _{NH₃} ⁻¹ cm ⁻²	14.3 mM NO ₃ ⁻ , 0.1 M NaSO ₄ , pH=7	17

Rh@Cu	93%	-0.2 V vs RHE	1.27 mmol h ⁻¹ cm ⁻² -0.4 V vs RHE	19.40 Wh g _{NH₃} ⁻¹ cm ⁻²	0.1 M KNO ₃ , 0.1 M Na ₂ SO ₄ , pH=11.5	18
CoP NAs/CFC	~100%	-0.3 V vs RHE	9.56 mol h ⁻¹ m ⁻² -0.3 V vs RHE	19.79 Wh g _{NH₃} ⁻¹ cm ⁻²	1.0 M NaNO ₃ , 1.0 M NaOH, pH=14	19
a-RuO ₂	97.46 %	-0.35 V vs RHE	0.1158 mmol h ⁻¹ cm ⁻² -0.35 V vs RHE	32.10 Wh g _{NH₃} ⁻¹ cm ⁻²	200 ppm NaNO ₃ , 0.5 M Na ₂ SO ₄ , pH=7	20
Bi-X _{red}	90.6%	-0.5 V vs RHE	46.5 g h ⁻¹ g _{cat} ⁻¹ -0.8 V vs RHE	13.09Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.5 M KNO ₃ , 1.0 M KOH, pH=14	21
Cu single- atom catalyst	~88%	-1.2 V vs RHE	27.84 mg h ⁻¹ cm ⁻² -2.0 V vs RHE	42.47 Wh g _{NH₃} ⁻¹ cm ⁻²	1000 ppm KNO ₃ , 0.5 M Na ₂ SO ₄ , pH=7	22
Cu-N-C SAC	84.7%	-1.0 V vs RHE	4.5 mg h ⁻¹ cm ⁻² -1.0 V vs RHE	23.28 Wh g _{NH₃} ⁻¹ cm ⁻²	0.1 M KNO ₃ , 0.1 M KOH, pH=13	23
Ru-CuNW	96%	0.04 V vs RHE	76.5 mg h ⁻¹ cm ⁻² -0.135 V vs RHE	17.19 Wh g _{NH₃} ⁻¹ cm ⁻²	2,000 ppm NO ₃ ⁻ , 1 M KOH, pH=14	24
Co-SACs	92.0%	-0.69 V vs RHE	0.433 mg h ⁻¹ cm ⁻² -0.89 vs RHE	24.53 Wh g _{NH₃} ⁻¹ cm ⁻²	100 mg/L NO ₃ ⁻ , 0.02 M Na ₂ SO ₄ , pH=7	25
Copper/cobalt -based catalysts	93.3%	-0.175 V vs RHE	1.17 mmol h ⁻¹ cm ⁻² -0.175 V vs RHE	26.82 Wh g _{NH₃} ⁻¹ cm ⁻²	0.01 M KNO ₃ , 0.1 M KOH, pH=13	26
Meso-PdN Alloy	96.1%	-0.7 V vs RHE	4.6 mg h ⁻¹ mg _{cat} ⁻¹ -0.8 V vs RHE	11.3 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	5.0 mM KNO ₃ , 0.1 M Na ₂ SO ₄ , pH=7	27
Fe ₂ TiO ₅ nanofiber	87.6%	-1.0 V vs RHE	0.73 mmol h ⁻¹ mg _{cat} ⁻¹ -1.0 V vs RHE	6.29 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.1 M NaNO ₃ , PBS solution, pH= 7.4	28

MP-Cu	99.8%	-0.3 V vs RHE	0.543 mmol h ⁻¹ cm ⁻² -0.3 V vs RHE	24.86 Wh g _{NH₃} ⁻¹ cm ⁻²	0.05 M NO ₃ ⁻ , 1 M KOH, pH=14	29
CoP-CNS	93.3%	-0.33 V vs RHE	3.09 mmol h ⁻¹ cm ⁻² -1.03 V vs. RHE	29.79 Wh g _{NH₃} ⁻¹ cm ⁻²	1.0 M NaNO ₃ , 1 M NaOH, pH=14	30
NiCo ₂ O ₄ Nanowire Array	99.0%	-0.3 V vs RHE	0.972 mmol h ⁻¹ cm ⁻² -0.6 V vs. RHE	25.03 Wh g _{NH₃} ⁻¹ cm ⁻²	0.1 M NaNO ₃ , 0.1 M NaOH, pH=13	31
Pt _{0.9} /Ce _{0.5} -SS	94.12 %	-0.5 V vs RHE	0.59 mmol h ⁻¹ cm ⁻² -0.8 V vs. RHE	38.45 Wh g _{NH₃} ⁻¹ cm ⁻²	0.1 M KNO ₃ , 0.5 M Na ₂ SO ₄ , pH=11.5 (adjusted)	32
SN Co- Li ⁺ /PCNF	72.7%	-0.94 V vs RHE	0.71 mmol h ⁻¹ cm ⁻² -0.94 V vs. RHE	44.95 Wh g _{NH₃} ⁻¹ cm ⁻²	0.5 M NO ₃ ⁻ , 0.5 M Na ₂ SO ₄ , pH=7	33
Au ₁ Cu	98.7%	-0.2 V vs RHE	0.555 mg h ⁻¹ cm ⁻² -0.2 V vs. RHE	64.41 Wh g _{NH₃} ⁻¹ cm ⁻²	7.14 mM NO ₃ ⁻ , 0.1 M KOH, pH=13	34
Co ₃ O ₄ nanotubes	99.5%	-0.6 V vs RHE	35 mg h ⁻¹ cm ⁻² -1.2 V vs RHE	27.08 Wh g _{NH₃} ⁻¹ cm ⁻²	0.1 M KNO ₃ , 0.5 M K ₂ SO ₄ , pH=7	35
single-atom Ru sites	72.8%	-0.6 V vs RHE	0.15 mmol h ⁻¹ cm ⁻² -0.6 V vs RHE	53.82 Wh g _{NH₃} ⁻¹ cm ⁻²	0.5 M NO ₃ ⁻ , 1.0 M KOH, pH=14	36
RuO _x /Pd	98.6%	-0.5 V vs RHE	23.5 mg h ⁻¹ cm ⁻² -0.5 V vs RHE	21.81 Wh g _{NH₃} ⁻¹ cm ⁻²	0.1 M KNO ₃ , 1 M KOH, pH=14	37
Ni ₃ Co ₆ S ₈	86.3%	-0.4 V vs RHE	2.4 mg h ⁻¹ cm ⁻² -0.4 V vs RHE	54.33 Wh g _{NH₃} ⁻¹ cm ⁻²	50 mg/L NO ₃ ⁻ , 1 M KOH, pH=14	38
BiPd	99.6%	-0.6 V vs RHE	47 mg h ⁻¹ cm ⁻² -0.7 V vs RHE	27.72 Wh g _{NH₃} ⁻¹ cm ⁻²	0.1 M NO ₃ ⁻ , 1 M KOH, pH=14	39
Fe-V ₂ O ₅	97.1%	-0.7 V vs RHE	16 mg h ⁻¹ cm ⁻² -0.8 V vs RHE	26.64 Wh g _{NH₃} ⁻¹ cm ⁻²	0.1 M NO ₃ ⁻ , 1 M KOH, pH=14	40

amorphous graphene	95%	-0.93 V vs RHE	3 mg h ⁻¹ cm ⁻² -0.93 V vs RHE	21.60 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	1 M NaNO ₃ , pH= 7	41
MBene	96.8%	-0.6 V vs RHE	35 mg h ⁻¹ cm ⁻² -0.8 V vs RHE	29.58 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.1 M NO ₃ ⁻ , 1 M KOH, pH=14	42
NiO ₄ -CCP	94.7%	-0.7 V vs RHE	1.83 mmol h ⁻¹ cm ⁻² -0.9 V vs RHE	7.75 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.5 M NO ₃ ⁻ , 1 M Na ₂ SO ₄ , pH=7	43
Ru _x Cu _y /rGO	98%	-0.05 V vs RHE	0.38 mmol h ⁻¹ cm ⁻² -0.05 V vs RHE	20.80 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.1 M NO ₃ ⁻ , 1 M KOH, pH=14	44
ZnSA-MNC	94.8 %	-1.0 V vs RHE	0.32 mmol h ⁻¹ cm ⁻² -1.0 V vs RHE	11.27 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.5 mM NaNO ₃ , 0.1 M Na ₂ SO ₄ , pH=7	45
Pd/NF	80%	-1.0 V vs RHE	1.52 mmol h ⁻¹ cm ⁻² -1.4 V vs RHE	24.43 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.1 M NaNO ₃ , 0.5 M Na ₂ SO ₄ , pH=7	46
Cu-doped Fe ₃ O ₄	100%	-0.6 V vs RHE	7.18 mg h ⁻¹ cm ⁻² -0.6 V vs RHE	14.01 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.1 M KNO ₃ , 0.1 M KOH, pH=13	47
NiPr-TPA-COF	90%	-1.38 V vs SCE	2.5 mg h ⁻¹ cm ⁻² -1.46 V vs SCE	24.92 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.1 M KNO ₃ , 0.5 M K ₂ SO ₄ , pH=7	48
Rh NFs	95%	0.2 V vs RHE	0.253 mg h ⁻¹ cm ⁻² 0.2 V vs RHE	10.18 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	0.1 M NO ₃ ⁻ , 0.1 M Na ₂ SO ₄ pH=11.5 (adjusted)	49
Ni ₃ Fe-CO ₃ LDH	96.8%	-0.2 V vs RHE	1.261 mg h ⁻¹ cm ⁻² -0.2 V vs RHE	28.35 Wh g _{NH₃} ⁻¹ mg _{cat} ⁻¹	5 mM KNO ₃ , 1 M KOH, pH=14	50
