This PDF file includes:

Figures S1 and S2

Other supporting materials for this manuscript include the following:

Tables S1 to S3

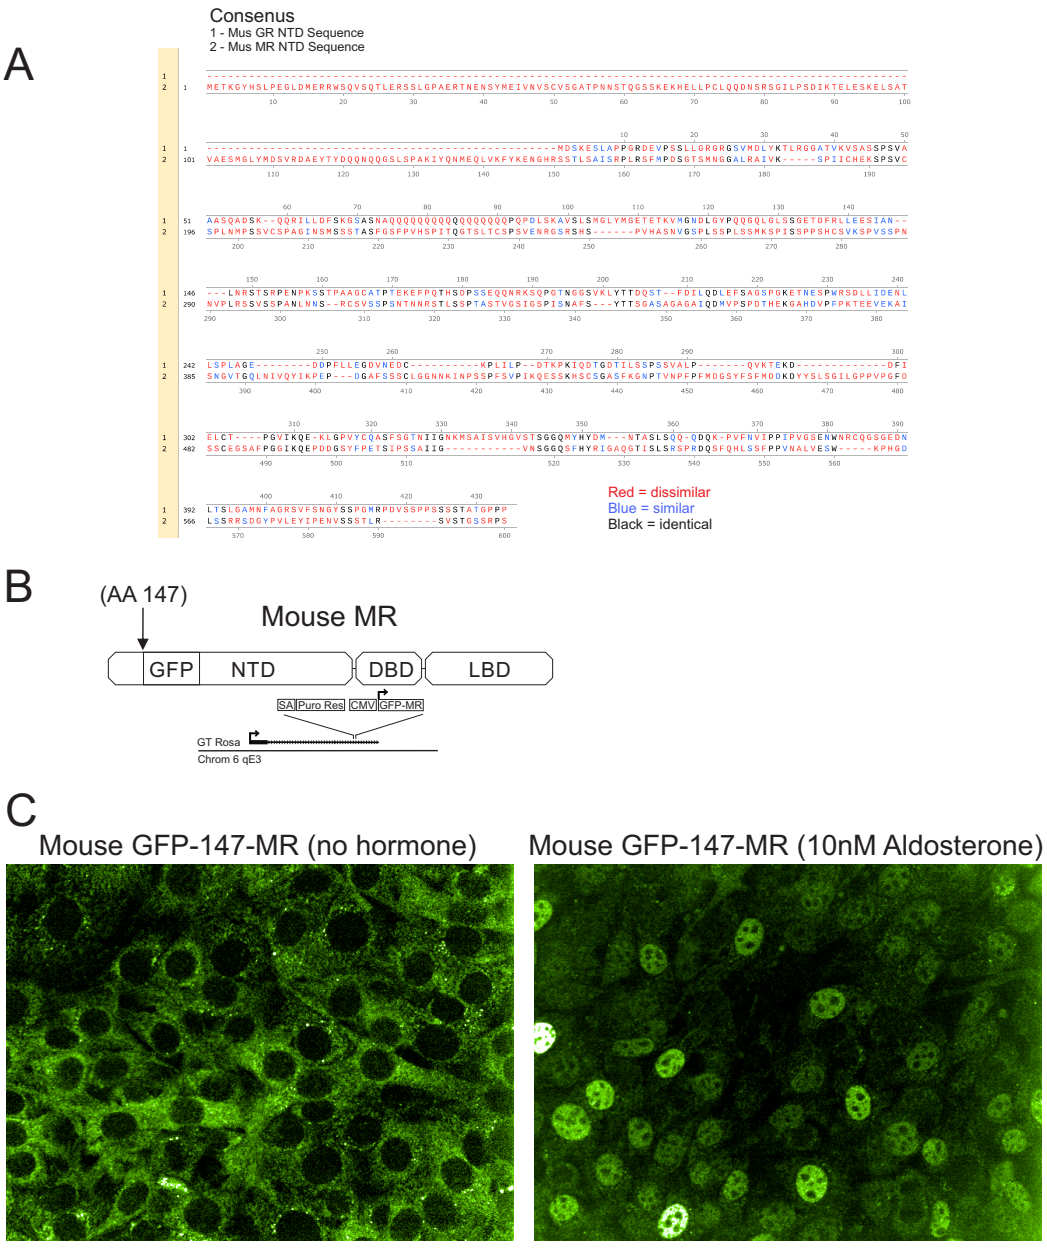

Figure S1. A. Sequence comparison between *M. musculus* MR and GR NTD. B. Schematic representation of M. musculus MR indicating the eGFP insertion site and the structure of the Donor-Rosa26_Puro_CMV-eGFP-MR vector. C. Representative confocal images showing eGFP-MR expression in a stable cell line and nuclear translocation after 1h 10 nM aldosterone treatment.

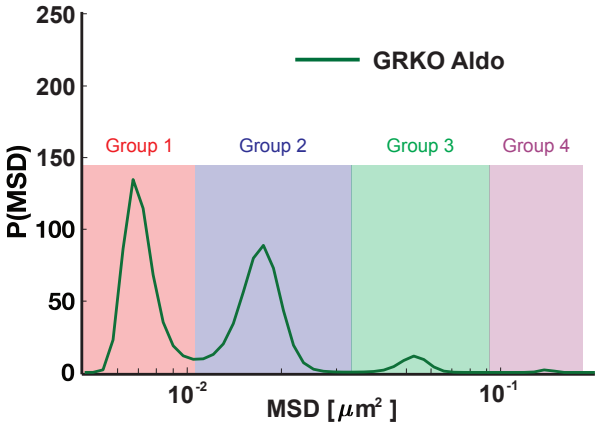

Figure S2. Identification of different mobility groups from the MSD distribution. A. representative mean squared displacement (MSD) distribution obtained by iteratively fitting the van Hove correlation function is shown. The local minima can be used to identify four distinct mobility groups.
