

**Figure S7. Quantification of Sia depletion under oseltamivir treatment.**

Cells were incubated for 48 h at 33 °C after WSN33, CA09, HK68 and BR07 NA transfection. For oseltamivir groups, 50 nM oseltamivir was added at the time of transfection. All treatments were performed side-by-side for comparison and contain data from at least 10 cells. P-values are determined by independent t-tests.
